VOL. 3. PETERBOROUGH, ONT., JANUARY 1, 1883. NO. 1.

LAW AND LOG DRIVING.

A case involving the legal rights of log drivers in streams was lately adjudicated at Saginaw, Mich., and excited considerable interest among lumbermen. Jerome P. Kroll sued Thomas Nester for $5,000, on the charge that Mr. Nester ran his logs among the plaintiff's in the Tittabawassee river, making it necessary to remove them at a cost of the amount sought to be recovered by suit. The history of the case in brief is this: Kroll took a contract to drive about 80,000,000 feet of logs on tributaries of the Tittabawassee, above the mouth of the Sugar river, Nester also having about 60,000,000 feet in the Sugar. It was alleged by Kroll that Nester would run his logs down to the mouth of the stream, and whenever space was made in Kroll's drive, Nester would run his logs between so that Kroll was compelled to move Nester's logs in order to drive his own. Kroll claimed that it was worth $5,000 to do this work, and to dam the tributaries in order to obtain a head of water to let the logs down. The judge in his charge to the jury said:

"The plaintiff claims that in the year of 1881 he entered into certain contracts with various log-owners who had logs upon the tributary streams above the Gerrish dam, known as the East Branch and the Middle Branch, and upon the main stream above the Gerrish dam, and below the mouth of the Sugar river; that by the terms of these contracts he was authorized by the owners of the logs to run and drive all their logs from the points where they were banked to within the limits of the Tittabawassee Boom Company—in other words, to drive them below the Gerrish dam. He claims that while engaged in this work the defendant had a large quantity of logs in the Sugar river, a branch of the Tittabawassee, coming into it about 15 miles above the Gerrish dam. The plaintiff claims that he ran those logs belonging to the defendant, from the mouth of the Sugar river down the Tittabawassee and into the boom limits at the Gerrish dam; that after they passed from the Sugar river into the Tittabawassee they created an obstruction to its floating capacity and navigation, and that in order to remove the obstruction so as to get his own logs down he was compelled to expend a large amount of labor, and he asks compensation for the same in this suit. I think you can find from the testimony in this suit that the Tittabawassee river, up as far as the mouth of the Sugar, at least, was a public highway and a navigable stream."

The judge then proceeded, at some length, to recall the attention of the jury to the fact that although the plaintiff commenced the driving of the logs about April 19, the Gerrish dam was not put in until about May 15, and that all the logs that passed into the boom limits between those dates were brought down by the assistance of the natural flow of water, while the logs that were put through after May 15 were driven by the aid of the Gerrish dam and other dams above it, and that they could not have been driven with the unaided natural flow of water. The jury were instructed that, under the statute, they might render a verdict in favor of the plaintiff for whatever logs were run down by the aid of the natural flow of water, if they found that any of the defendant's logs were so run by the plaintiff.

The court also charged the jury that the plaintiff could not recover for any work performed hy him on Mr. Nester's logs after the Gerrish dam was put in; for all the work claimed to have been done after that was by means of artificial floods created by dams put in for the purpose; and the statute does not apply to work of that character. It was designed to provide a mode for recovering the cost of work done in removing obstructions from streams that are public highways. Before parties can recover for work done in running logs upon a stream navigated in an artificial way they must either make a contract with the owners of the logs, or they must form a company for the improvement of the stream, and obtain from the legislature a right to take tolls. Private persons have no right to dam or boom a navigable stream of water without authority from the state. It appears that the plaintiff has not proceeded under the law, but has merely acted as the agent of various log owners, who could not confer any power on Mr. Kroll to to take a stream in its navigable state and increase its navigability by the use of dams and floods, and then charge others for the use of such improvement. The court therefore finally charged the jury that in making up their verdict they should omit any consideration of the work claimed to have been done by the plaintiff after the Gerrish dam was put in, where the Tittabawassee company receives logs put in above, as whatever work may have been done after that time was accomplished by the aid of artificial dams and floods, without corporate authority, or special permit from the state. The jury retured a verdict of $800 for Mr. Kroll.—*Northwestern Lumberman.*

THE TORONTO TRADE.

According to the statements obtained from the principal lumber dealers of the city, the lumber trade this year has been very satisfactory in volume, and has been equal to that of last year if not ahead of it. The demand has been well up to the supply, so that the prices of last year have been maintained, and for some grades have shown an advance of 20 per cent. The bulk of the lumber handled by the Toronto dealers has of course been shipped to the United States via Oswego and Charlotte. The Americans are in fact appreciating Canadian lumber so much that an agitation has been started for a repeal of the duty. The Secretary of the Chicago Lumbermen's Exchange has been for some time past in this country collecting facts and stastistics that would strengthen the arguments for the free admission of Canadian lumber into the United States. The American lumber is getting scarce, and lumbermen on the other side contend that no harm would be done to American interests by Canadian competition. While the export trade from the United States has increased during the year the local trade has hardly been so good, but the country trade it is said has been satisfactory. It is estimated that taking all the Toronto firms, the total amount handled for all purposes during the year reached 140,000,000 feet. Of this quantity one firm handled not less than 60,000,000 of feet, while another important firm handled 20, 000,000 ieet.

Owing to the want of snow the output was not so great last season as was anticipated. Reports from the lumhering districts state that there is now too much snow, the depths in many parts being four feet, which puts serious difficulties in the way of handling.

With regard to next year's business the feeling is not to stock over what the mills had last year. It is believed that it would not he wise to increase the product, as prices are as high as they can be expected to go, and there is a fear in the trade of over-production. The cost of stocking last season was very high. Provisions were dear and lumbermen were scarce. It is too early in the winter to predict what amount will he hauled this shason, but if thcre is favorahle weather there will, no doubt, be a good supply.—Toronto *Mail*, Tuesday 12th Dec.

TO TRANSPLANT TREES IN WINTER.

E. W. Cornell, Clinton Corners, N. Y., gives to the *Dutchess Farmer* suggestions about transplanting trees in winter, a useful method when time is a matter of importance, or when the immediate securing of large specimens for the lawn is especially desired: "When properly done the holes should, of course, be dug when the ground is not frozen, and the soil placed in a compact heap and covered on the south side of the hillock with some coarse litter from the horse stable to keep a portion of the soil from freezing, which will give the planter access at any time during the winter. Sufficient loose soil to pack about the ball of earth will be taken up with the tree, which will be nearly sufficient of itself to fill the receptacle, aud the dressing will be just where wanted to spread about the tree for winter protection and for immediate nourishment in the spring. Experience has taught me that it is highly needful to furnish some fertilizer for all trausplanting trees at the time of removal. In halling out trees it is not advisable to wait until the ground is frozen hard, as is often done, which greatly increases the labor and expeuse,

"It is only necessary to dig a narrow trench about the tree, which may be quite near the trunk; the soil being damp will be held by the many fibrous roots from falling into the trench, which should be deep enough for cutting down through the horizontal roots, which, with most trees, will require a depth of from 15 to 20 inches, laying bare the top roots. Having dug about all the trees in like manner, all you have to do is to wait until the ball of earth is frozen, when you have only to chop off the the main perpendicular root, and with the trunk for a lever, two can readily load upon a stoneboat or sleigh a tree, with ball of earth attached, as heavy as a team can haul. When arrived at the place of setting drive the boat or sleigh upon the heap of soil in such a manner that it will incline toward the pit, and in a moment you may slide the tree to its appointed place."

"Tramp some of the soil from under the dressing around the ball of earth; put the litter about it, and the work is done much better than it could be at any other season of the year, for the multitude of fibrous roots in the ball of earth preserve the roots from any check until the larger roots can throw out a colony from the points where they were cut off. There is no necessity for losing one tree in 100 by this method, while a large tree can be removed with as much safety as a small one, providing the ball of earth attached be correspondingly enlarged. This method is exceedingly favorable for the resetting of evergreen trees, which otherwise is attended with much danger of loss from the least drying of the roots. It is a work well adapted to the winter, as it can readily be discontinued at an inclement season, to be resumed at any favorable moment."

A QUEBEC despatch says:—Only fifteen carloads of Messrs. Grant & Co.'s square timber are coming down by the North Shore Railway this winter. The balance will remain over until the spring. The timber has now to be piled on the wharf, as it cannot be sent by water to the coves, owing to ice on the river.

IN reference to the McLaren-Caldwell case the *Lumberman's Gazette*, of Bay City, Michigan says:—At this distance the premises of the *Mail* appear to be well taken, and proof against its assailauts. Mr. McLaren is quite well known here, and his victory, founded as it apparently is upon justice, will gratify Saginaw lumbermen.

THE Belleville *Intelligencer* says:—Lumberers may be interested in knowing the precise quantities of the different woods wintering over here. There are as follows:—White pine (square), 6,532 feet; white pine (waney), 3,354,943; feet; red pine, 2,363,624 feet; oak, 1,362,153 elm, 530,611 feet; ash, 212,422 feet; birch, 78,-413 feet; pipe staves, 293; puncheon staves, 1,-007; pine deals, 2,507,704; spruce deals, 1,012,-920.

OVERPRODUCTION THE CAUSE OF DEPRESSION.

That zealous greenbacker, Mr. Sam Cary, has often stoutly asserted in his speeches that there is no such thing as overproduction—an expression so fallacious that the simplest mind can realize it. When any commodity accumulates much in excess of the demand for it, an overproduction has taken place, and a weakness in its value will result in proportion to the size of the surplus. This is a commercial law as ancient as trade, and needs no argument to prove it.

It follows naturally, then, that overproduction, more than anything else, is the cause of every business and financial depression. Speculation is often given as a reason why panics occur, but really, speculation is only an incident in the general movement of trade, and as often grows out of a panic as apparently produces one. Speculation is simply a venture on the change in values, on the future, or on the differences of prices in separate localities. It can hasten a financial revulsion—can be the incident that precipitates it—but of itself alone it can never be the cause of a break-down in general business. The flurries in the New York stock market since the summer of 1881, at each occurence giving rise to forebodings of a business revulsion, but always failing to bring it, are examples of great disturbance in finances without a corresponding effect on general commercial relations. The reason of this is that while the stock speculators were forcing securities up and down, and creating a panic among themselves, the people at large were engaged in producing what they found a ready market for at good prices, and were, therefore, prosperous. As long as there was not such an accumulation of farm products and manufactured goods as to glut the various markets and prevent a copious interchange, the bulls and bears of the stock exchange might bellow and roar themselves hoarse, the bankers utter wise predictions of near depression—nobody heeded so long as he could sell all he could produce, and get good prices for it.

In this heedlessness of the future lies the danger of overproduction, which is really the cause of every decline in values. When there is an active demand for commodities, and it is long continued, producers become infatuated with the notion that there is no limit to it, and that production can be augmented without any regard to the prospective demand. Business and manufacturing branch out, one plant inducing the establishment of another. Capital is aroused, and once broken loose from its conservatism, seeks investment in new enterprises, or the expansion of the old in a crazy kind of way that would be impossible in hard times. Take the rush in railroad building for the last two years as an instance. Previous to that time populous and thrifty districts of the country lay without facilities of transportation, and delegations of citizens could neither beg nor buy the railroad companies into building extensions or branch lines. Now what do we see? New railroads have within the past three years penetrated to points before obscure, where there was the least show for present or prospective business, especially if there were any danger that a rival company would build a road and obtain the traffic. A big saw-mill, or any other manufactory, has been inducement enough to coax a company to put in a branch connecting it with the main line. There has been a kind of mania for railroad building that at one time seemed without reason, and has actually caused an overdoing of the thing, which railroad managers now acknowledge; though in this particular instance overproduction has benefitted everybody but those bondholders whose securities have sunk in value on their hands.

The overbuilding of railroads has stimulated the steel rail makers, and iron-workers to the top of their speed in turning out product to meet the demand. There was no means of knowing how much would be required, and though rail makers operate only on orders, the tendency to overproduction has been felt in the planting of new mills and enlarging the capacity of old ones, so that machinery is now liable to stand idle. The overproduction can be seen in too much capacity to produce.

In the lumber business the demand for product has been such during the last two years that every means has been employed to increase it. Pine lands have been bought up at advancing values, hundreds of mills have been erected, logging railroads constructed, streams improved, and new fields of operation have been invaded by the lumbermen's enterprise. The result has been that the output of this year has been considerably larger than it was in 1881, while the capacity of production has been increased to a great extent, giving promise that there will be a considerable increase in manufacture during the season of 1883, earnest of which is given by the determination of operators to put in a larger stock of logs that they did last year.

Every variety of manufacture and business might be reviewed, showing that the majority of them have, during the past years of prosperity, been crowded a little beyond what the demand required; that is, the demand in the earlier period of prosperity gave industry such a momentum that now that a halt is necessary no brakes are at hand. Now the danger is that, before the motion can be arrested, industry will be wrecked on an accumulation of products.

Coming back to the lumber business, it is plain to be seen that the depression of values with which the manufacturing has closed is consequent on overproduction. It is true that if there had not been some falling off in railroad building, and if the farm product of 1881 had been a little larger, there would have been no slackening in the demand for lumber, so that the output this year would have been as quick in the market as it was in 1881 and the winter of 1882. Yet it is a fact that the enormous surplus on hand now represents a certain amount of overproduction, or else prices would not now be weak. Any lumber dealer would regard the attempt of the lumberman's meeting of this city to bull prices this winter repeatedly, as it did last winter, as a mockery of the good sense of lumbermen at large. That is to say, on account of the fact that lumber has been produced considerably in excess of the demand, it is not worth as much as it was six months ago. Nothing is plainer than this, yet the loggers and mill men are going ahead this winter to still further increase the surplus, with the opinion apparently strong in their minds that there is to be no halt in the increase of consumption. If the value of lumber next season drops to something like the low figures of 1873 and the years following, the manufacturers will have done it themselves. The *Lumberman* is not undertaking to say that there may not be contingencies that shall give an upward turn to affairs. But from present appearances it is safe to judge that the country will not need more lumber next year that it did this, and it would not be surprising if it should consume less. At any rate, considering the large surplus now on hand, it would appear to be sufficient for all emergencies, even if the cut next year should show no increase.—*Northwestern Lumberman.*

COLLECTIONS OF WOODS.

The Chicago *Lumber Trades Journal* publishes the following extracts from a letter from Professor C. S. Sargent to Morris K. Jesup, Esq., dated Nov. 11, 1880. Though they have special reference to the United States these suggestions are worth considerarion in Canada:—

The following suggestions are made in regard to the collections of the woods of the United States:

1. That every arborescent species found growing naturally within the limits of the United States should be represented in the collection.

This would include the semi-tropical West Indian species which reach southern Florida, and the few Mexican species extending north of the boundary into our territory. It is essential that these should be included in order that the collection may fully represent our arborescent flora; and because many of these southern species produce material of great value, becoming large and common trees toward their centres of distribution south of our boundary. They must become, sooner or later, objects of very considerable economic interest of the American people. A few exotic species of first rate economic value, already either fully naturalized or rapidly becoming so, should also be included. Such trees are the Eucalyptus, the Orange, the Ailanthus, the Pride of China, the Tallow tree, and perhaps one or two others.

2. That the species be arranged scientifically; that is, in their botanical sequence, in the order and with the numbers adopted in my forthcoming Census Report on the American Forests.

3. That each species, while in connection with its nearest botanical allies, should be so arranged with its products that it would form in itself a complete exhibit. Each species would thus be represented by a portion of the trunk showing bark, nature of the wood, rate of growth, and proportion of sap to heart wood; and by copious mounted specimens of the foliage, flowers and fruit. Around this species exhibit should be grouped the products of the species, such as specimens of planks, polished and unpolished; pieces of the wood of monstrous or distorted grain adapted to cabinet making; specimens illustrative of the durability of the wood of the species; specimens of tanning material, dies, wood pulp, turpentine, gums, and other minor products of the species.

4. That a conspicuous label be attached to each of the species groups, giving the Latin and English names of the species, with the principal synonyms by which it is known, its geographical range, size, etc.

On the label should also be given the results of our census tests of American woods.

These suggestions being carried out, the visitor would see at a glance the scientific character and position of every tree in the United States in relation to its botanical connections, the economic value and nature of its products, and its geographical distribution.

Such a collection, thus arranged, would afford material for the information and instruction of every class of people in any way interested in our trees and their products and uses. No collection of forest products has yet been formed on a sufficiently comprehensive scale to enable the student to readily examine the sylva of a country in all its scientific and economic aspects.

It is recommended that photographs of American forest trees and American forest scenery should be added, and that this collection should be made as large as possible, as being a very important feature in relation to landscape gardening and horticulture.

The public spiritedness of Morris K. Jesup, Esq., of New York, induced him to provide the funds to carry out the above suggestion of Prof. C. S. Sargent, of Harvard College, and the place selected for the exhibits is in Central Park, N. Y., where already those visiting the place may witness a large fulfillment of the object. The extracts were furnished the *Journal* by Prof. Sargent.

U. S. LUMBER DUTIES.

The Chicago *Lumber Trade Journal* says:—The time is fast approaching when the attention bestowed upon the lumber tariff question by the United States Tariff Commission must assume the form of a report in the line of recommending a cessation or continuance of the existing revenue on this indespensible commodity. Wherever we have penetrated a glance into regions where the lumber trade is carried on, we have been imperatively impressed with the degree of importance attached to the subject by extensive dealers, so far as relates to the desire for a removal of duty. Men who know as accurately as may be known from long experience and acquaintance with the subject the signs of the times, and therefore do not halt or falter in expressing their opinions. It may be imagined by some of both factions at this point that outside of Chicago, where the tariff discussion was born, or, at least, received the first large and important discussion, and where it drew to both sides able and farseeing men, there has been little if any interest evoked. This, they will find, is a great mistake, as we have the assurance of men who figure quite conspicuously in the industry at several leading markets that they are anxious to welcome free Canadian lumber, and are ready to join encouragement and whatever aid they may to the leaders of revolt against monopoly.

These men, too, know something of the true philosophy of advancing the rapid and beneficent growth of our agricultural possibilities, and while desirous that the manufacturer should maintain in his sales a satisfactory and ample margin of profit, they are on the other hand, not willing to witness the desirable promotion of our West retarded by exorbitant prices, nor prepared to encourage a laxity and dullness of their business through the unreasonableness of American timber owners and manufacturers. The resources of the manufacturer are too certain in their promises to add fabulous sums to their already overflowing coffers of riches, to cause them to betray the least anxiety, and what the country demands is not that they should not receive a fair and reasonable price for the product, but relax the despotic power, placed in their hand by the present revenue, to dictate future prices, or be forced to do so by the admission of foreign lumber free of duty.

The flow of emigration to the Western States and Territories, which, to the extent already settled, has been largely due to procuring necessities at prices within a reasonable demand on sellers' pocketbooks, must be encouraged by the further possibilities of securing in the future material cheaply and plentifully for the construction of homes and all building necessities, otherwise the fact of being unable to secure this material at rates conforming with the means of colonists, will retard more than is generally supposed the influx of the foreign emigration, indispensable in advancing settlement in the apparently boundless and unoccupied territory of the West.

The good that may early result to the prospective development of opportunities for our welfare as a nation in no small measure lies within the power of suitable legislation concerning the lumber supply and proper protection to consumers, and should emanate from the wisdom of next Congress.

GROWTH OF BARGE TRANSPORTATION.

Previous to the year of 1862 great difficulty had been experienced by shippers of lumber in obtaining towage for that commodity from the West to Buffalo, and on account of the rapidly increased demand and supply the freight on lumber had attained to the almost prohibitory price of $7 to $10 per M. feet from the Saginaw Valley to Buffalo. J. S. Noyes, of this city, then, as now, a large dealer in lumber, thought to overcome the difficulty and to place this product of the great west upon the Eastern markets at reduced rates of freight, and so far succeeded that in less than ten years after his first experiment the price was reduced from $9 to 9 shillings.

The first attempt was made by himself, Mr. John T. Leaton, of the old firm of Farmer, DeBlaquire & Deeds, Joseph Van Vleek and one or two others in the summers of 1860 and 1861, by making up immense rafts on the Saginaw River, the details of which are still familiar to many of the people of Bay City, and towing them through the lakes. Bugbee and Selim Sears were also interested in rafting lumber, and H. A. Frink tried rafting staves, though unsuccessfully. The rafting of lumber proved but a partial success, for notwithstanding only one raft was lost the timber became so much damaged by bruising and dirt that this was found impracticable. It was evident that something else had to be done, and in the spring of 1862 it occurred to Mr. Noyes that the hulls of the old steamers, which were at one time the pride and glory of our lakes, several of which were dismantled and stripped of their cumbrous cabins were lying at anchor and sunk at the foot of Belle Isle, Detroit, could be utilized in this direction. He at once purchased two of them, the Sultana and Empire, at an expense of about $25,000, soon had them in commission; hired a tug at $100 per day, and running both barges with one crew, consisting of a captain, four men, and a cook, transferring these from an empty barge to a loaded one at the mouth of the Saginaw River, safely carried 1,000,000 feet of lumber on each barge at each trip. The Sultana arrived in Buffalo on her first trip in June, 1862.

Thus was devised a cheap style of transportations which has been growing ever since, and has, in fact, become nearly the only way of carrying lumber to the Buffalo market. Its effect was to bring down on the head of young Noyes the opposition and anathemas of the rich vessel owners of the lakes. In one man only he tells

us—the lamented Capt. E. P. Door—had he a friend to his scheme, who gave him encouragement and counsel. In 1863 he purchased the tug Reindeer, and thus commenced a system of transportation which has grown to mammoth proportions, not only in lumber, but grain and other products, and not only upon our lakes, but it has extended to the shores and bays of both oceans.

In the place of one spar and one tail to keep them before the wind, they are now built with two and even three masts, enabling them better to care for themselves in case of compelled desertion by the propeller. In 1870 there were 128 barges on our lakes of a capacity of over 40,000 tons custom house measurement, and representing a capital of over $1,000,000. So that the old Sultana and Empire, whose arrivals and departures to and from Buffalo thirty-five years ago created an excitement unparalleled in the history of passenger traffic, were destined to become in their old age the pioneers of a system of transportation that to-day feeds one half of the men who go on the lakes for a livelihood.—*Bay City Call.*

FARMING FORESTERS.

The Chicago *Northwestern Lumberman* says: At the national agricultural convention which has been in session at the Grand Pacific Hotel, this city, for several days, recently, the subject of forestry was brought under discussion. Ex-governor Furness, of Nebraska, read a paper entitled "Tree Planting and Growing on the Plains." He characterized it as not a treatise on forestry, but an account of what had been done to convert naturally treeless plains into groves of valuable timber. He asserted that, through the stimulus of rigid legislation, Nebraska had taken on an acquired diginity as a timber-producing state. No longer ago than 1854 tree planting was begun there, spontaneous growths of timber being noticed along the water courses. Seedlings were found to thrive well on upland prairies, and gradually trees were added other than the native ones. Since the policy of tree planting was introduced, the speaker said over 244,350 acres of land in the state had been planted with forests. During the past 28 years, he estimated, over 605,514,000 trees have been set out, the spontaneous growth influenced by this planting equaling half as many more. The best and most profitable trees for growing in that state experience has shown to be as follows: Six varieties of ash, seven of oak, walnut, hickory, elm, locust, linden, sycamore, maple, willow, cedar, several varieties of pine, and many others more have been to some extent handled with success. Though nature was, after all, the best nurseryman, yet man himself could do much to second the efforts of nature. The order of planting was given as follows: Cottonwoods, box-elder, soft maple, elm, ash, black walnut, locust, catalpa, oak, etc. The convention proposed to show its spirit on the forestry question, and adopted the following resolutions:—

Whereas, We begin to realize the lamentable wasting of the forest lands of the United States, and the sad effects of destruction upon the climate and water supply of the country, and we are forced to confess our need of the knowledge of the better management of the woodlands than is now possessed by the people; therefore

Resolved, That we urge upon the state legislatures the propriety of selecting judicious persons to act as state forestry commissions, whose duty it shall be to instruct the people in regard to forest trees and their production and management; said officers to report annually upon the condition of the woodlands in their respective commonwealths.

Resolved, That we beg of all the agricultural colleges established under the land grant of congress that they shall lose no time in planting state arboreta and establishing forest experimental stations where all species adapted to the soil and climate shall be tested, and whence surplus seeds and plants may be distributed. Annual reports of these establishments to be made to the governors of the state boards of agriculture.

Resolved, That congress be asked to establish one or more experimental forest stations upon the public domain, where the propagation and testing of useful trees shall be the leading object, with the collection of seeds and plants to be distributed by or under direction of the United States agricultural department, to which bureau these stations shall make annual reports.

THE TRADE OF QUEBEC.

The *Chronicle* of Dec. 21st give the following statement of the comparative receipts of timber measured and culled to date; also, the average of the past five years:—

WHITE PINE.

1881.....6,029,041
1882.....7,961,014

1,931,973 feet more this year.
Average of past five years.....5,738,572 feet.

Waney.

1881.....3,065,274
1882.....3,105,329

40,055 feet more this year.
Average of past five years.....2,365,593 feet.

RED PINE.

1881.....1,945,720
1882.....1,456,910

488,810 feet less this year.
Average of past five years.....1,312,010 feet.

OAK.

1881.....2,994,477
1882.....1,313,109

1,681,368 feet less this year.
Average of past five years.....1,690,262 feet.

ELM.

1881..... 1,027,670
1882..... 714,649

313,121 feet less this year.
Average of past five years.....638,760 feet.

ASH.

1881..... 408,798
1882..... 310,769

98,029 feet less this year.
Average of past five years..... .....210,906 feet.

BIRCH AND MAPLE.

1881..... 151,774
1882..... 269,661

117,887 feet more this year.
Average of past five years.....265,749 feet.

PIPE STAVES.

1881..... 418 M.
1882..... 564 "

146 M. more this year.
Average past five years.....331 M.

WEST INDIA STAVES.

1881..... 671 M.
1882..... 1,429 "

758 M. more this year.
Average of past five years.....664 M.

SAGINAW MILLS.

The following item, being a comparison of the work done by some of the saw mills in the Saginaw Valley in 1857 with that of tho season just closed, will prove interesting to many of our readers: The largest cut of any one mill in 1857, at East Saginaw, was 4,500,000 feet, that of Cushing & Co. Here are a few of the others: J. Hill, 2,500,000 feet; L. B. Curtis, 3,000,000 feet; D. G. Holland, 1,500,000 feet; Whiting & Garrison, 3,000,000; Copeland & Co., 1,500,000; Atwater mill, 3,500,000; Gallagher mill, 2,000,000: G. D. Williams & Son, 2,500,000; Curtis & King, 3,500,000. At Carrollton the mill of J. A. Westervelt cut in that year 4,000,000; the Johnson mill and Fisher mill at Zilwaukie, 4,000,000 and 1,500,000 respectively. At Fortsmouth, the McCormick mill cut 1,500,000; and James Fraser mill 3,000,000; and three others from 1,200,000 to 2,000,000 each. There were 14 mills at Bay City and Kawkawlin cutting from 1,500,000 to 4,000,000 each. The mill statistics for 1857 were furnished by the Hon. John S. Estabrook, of East Saginaw, still in the prime of life and engaged in the lumbering business. Of the seventy odd saw mills now on the Saginaw river, the smallest cut of any is about 7,000,000 feet and the average will probably reach 16,000,000. The mill of Barker & Birdsall, (formerly McGraw) cut this year a fraction over 40,000,000 feet; that of H. W. Sage about 32,000,000 feet; and the Whitney & Batchelor mill 31,500,000 feet. Last year, running some nights, the McGraw mill cut 55,260,722 feet. In 1857 there were 10,000,000 shingles manufactured on the river and the past year the quantity will considerably exceed 300,000,000. Thus do we progress.—*Lumberman's Gazette.*

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of trade, for the month of Nov., and for the first 11 months of the year:—

MONTH ENDED 30TH NOV., 1882.

	Quantity. Loads.	*Value. £.*
Timber (Hewn).		
Russia	27,470	58,422
Sweden and Norway	34,290	56,460
Germany	20,984	52,498
United States	3,597	20,473
British India	1,630	22,136
British North America	47,071	239,868
Other Countries	15,745	21,349
Total	150,787	471,206
Timber (Sawn or Split, Planed or Dressed).		
Russia	66,385	166,446
sweden and Norway	126,928	313,365
British North America	131,708	377,034
Other Countries	11,000	37,060
Total	336,026	893,905
Staves, (all sizes)	9,446	54,022
Mahogany (tons)	2,158	20,608
Total of Hewn and Sawn	486,813	1,365,111

11 MONTHS ENDED 30TH NOV., 1882.

Timber (Hewn).		
Russia	291,928	612,021
Sweden and Norway	584,778	929,340
Germany	281,005	797,451
United States	150,170	522,469
British India	37,419	477,129
British North America	248,195	1,202,499
Other Countries	303,580	388,964
Total	1,897,075	4,929,873
Timber (Sawn or Split, Planed or Dressed).		
Russia	1,151,571	2,908,194
Sweden and Norway	1,596,426	4,008,588
British North America	920,035	2,458,459
Other Countries	316,504	1,011,754
Total	3,984,536	10,386,995
Staves (all sizes)	118,704	608,107
Mahogany (tons)	33,227	323,446
Total of Hewn and Sawn	5,881,611	15,316,868

How to Recognize Good Wood.

Rankine says that there are certain appearances characteristic of good wood, to what class soever it belongs. In the same species of wood that specimen will in general be the strongest and most durable which has grown the slowest, as shown by the narrowness of the annular rings. The cellular tissue, as seen in the medullary rays (when visible), should be hard and compact. The vascular or fibrous tissue should adhere firmly together, and should show no wooliness at a freshly cut surface; nor should it clog the teeth of the saw with loose fibers. If the wood is colored, darkness of color is in general a sign of strength and durability. The freshly cut surface of the wood should be firm and shining, and should have somewhat of a translucent appearance. In wood of a given species the heavy specimens are in general the stronger and the more lasting. Among resinous woods, those having the least resin in their pores, and among non-resinous woods, those which have least sap or gum in them, are in general the strongest and most lasting. Timber should be free from such blemishes as "clefts," or cracks radiating from the centre; "cup shakes," or cracks which partially separate one layer from another; "upsets," where the fibers have been crippled by compression; "wind galls," or wounds in a layer of wood, which have been covered and concealed by the growth of the subsequent layers over them; and hollow or spongy places in the centre or elsewhere, indicating the commencement of decay.

AN ANGRY TREE.

A gentleman of this place has a tree which is a species of acacia. It was grown from a seed brought from Australia. The tree is now a sapling some eight feet in height, and it is in full foliage and growing rapidly. It is leguminous, and very distinctly shows the characteristics of the mimosa, or sensitive plant. Regularly every evening, about the time the "chickens go to the roost," the trees goes to roost. The leaves fold together, and the ends of the tender twigs coil themselves up like the tail of a well-conditioned pig.

After one of the twigs has been stroked or handled, the leaves move uneasily and are in a sort of mild commotion for a minute or more. All this was known about the tree, but it was only yesterday that it was discovered that the tree had in it much more life and feeling than it had ever before been credited with. The tree being in quite a small pot, one which it was fast outgrowing, it was thought best to give it one of much larger size. Yesterday afternoon the tree was transferred to its new quarters. It resented the operation of its removal to the best of its ability.

Arriving at his residence about the time the tree had been transplanted, the gentleman found the house in grand commotion. On asking what was up he was told that they had transplanted the tree according to orders and the operation had "made it very mad."

Hardly had it been placed in its new quarters before the leaves began to stand up in all directions like the hair on the tail of an angry cat and soon the whole plant was in a quiver. This could have been endured, but at the same time it gave out an odour most pungent and sickening—just such a smell as is given off by rattlesnakes and many other kinds of snakes in summer when tested. This odour so filled the house and was so sickening that it was found necessary to open the doors and windows. It was fully an hour before the plant calmed down and folded its leaves in peace. It would probably not have given up the fight even then had it not been that its time for going to roost had arrived.

THE Chicago *Northwestern Lumberman* says: The figures of the secretary of the Lumberman's Exchange estimate the total amount of hardwood now in stock in 21 yards of the city, at 37,500,000 feet, which is something of an increase over the summer stocks as indicated by the figures furnished from the same source. It is apparent that stocks are not observably diminishing, and that all season they have been replaced about in the ratio of current sales.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on Nov. 30th, 1881 and 1882, and also the Consumption for the month of Nov., 1881 and 1882:—

	Stock, Nov. 30th. 1881.	*Stock, Nov. 30th. 1882.*	*Consumption for the month of Nov. 1881.*	*Consumption for the month of Nov. 1882.*
Quebec Square Pine	472,000 ft.	381,000 ft.	234,000 ft.	189,000 ft.
" Waney Board	388,000 "	271,000 "		
St. John Pine	5,000 "	5,000 "	Nil "	Nil "
Other Ports Pine	45,000 "	66,000 "	7,000 "	12,000 "
Red Pine	45,000 "	68,000 "	20,000 "	3,000 "

ENGLISH PRICES.

The London *Timber Trades Journal* has the following article on "Present and Future Prices:"

"The letter of our Stockholm correspondent last week and the advices received from our other sources of information in Northern Europe admonish us that the season of shipping timber and deals for this country is virtually at an end for the year 1882. Open weather may prevail here and there, or an occasional thaw may for a brief while re-open a port previously accounted shut up; but only ships already loaded in the port or others near at hand, could avail themselves of such a chance, and even these latter would hardly expect to get out again before the ice set in, their advantage consisting in making a good loading port, to be in readiness for first open water in the spring, and possibly, if chartered, loading and lying under cargo till that time came around. To all intents and purposes, therefore, the import trade may be considered closed at its sources for this year, though at this end of the traffic a good deal may still be doing in the way of landing and delivering the latest shipments as they arrive. Nor is it easy to fix a period when it can be said that the last of this season's cargoes has come forward. Some ships that have got damaged on their homeward voyage will have put in somewhere for repairs, and on being again ready for sea will take the first opportunity to get away again if a favorable chance presents itself, and in Southern Sweden and Norway there are good roadsteads that are seldom obstructed by ice, such as Fredrikshald and Laurvig, where vessels can usually get away at any part of the winter, only that the short days and the insurance regulations of that country discourage native vessels from doing so during the dead of winter. But their first open water is counted to take place about the 20th of February by the insurance companies, when the more northern ports of the Gulf of Bothnia, and even the Baltic, are looking forward to be icebound for at least two months longer.

Looking westward we find the port of St. John, New Brunswick, equally favored in that respect over the other principal shipping ports of that province, Nova Scotia and the St. Lawrence. The great rise and fall of tides in the Bay of Fundy prevent any accumulation of ice, so as to close the port in winter, but there is generally for the reasons aforesaid, little doing in the way of timber export during the inclemency of that season, and we learn that, although freights for the United Kingdom are still quoted there, no new business is doing in that way just now, as it is not considered prudent to take up vessels at the rates now demanded.

From Quebec we learn that the ice is setting in, and no more vessels are likely to come down the St. Lawrence, nor are the lower ports likely to load any more vessels this year. In Europe, we learnt a week ago that the Finnish ports were closing, the river at Abo was blocked with ice, Uleaborg and Wyborg were both shut up, and the navigation considered closed on the eastern shores of the Baltic, nearly as far down as Stettin, which being rather earlier than usual seems to indicate the approach of a long and hard winter in those regions whatever may be in store for us at home. Thus it is made manifest that the shipping department of the import trade can do little or nothing more this year. It may also be said that every importer knows pretty well the sum total—or the maximum—that his supply can now amount to—that is if he has anything afloat—and his minimum will be determined by any accident at sea, which may prevent its arrival. It would therefore seem easy enough to calculate pretty nearly what will have to be added to the supplies already received at any particular port. But unfortunately this information is not to be obtained of any individual at places of large importation. Each merchant can tell what he has to arrive himself, but he cannot answer for his neighbors, and even those close observers who keep their eyes on what is going on, and whose ears catch the slightest whispers on the wind, till they think they could tell you on their fingers every timber ship afloat for their port, are not unfrequently thrown completely out of their reckoning by arrivals on consignment, or for merchants too remote, or apparently too inconsiderable, to have entered into their calculations. Thus it happens that there is always a degree of uncertainty as to how the season will terminate till the weekly list of arrivals thins down to a few stragglers, and finally comes to be disregarded as no longer having power to affect the markets.

This is the time, therefore, that the attention of the leaders of the trade is turned into a new channel. The vicissitudes of one season being at an end, let us see what the prospect is for the next, which will soon be upon us, and whether the salient points within the sphere of our observation are capable of guiding us to a right conclusion as to the kind of business that will be done when the shipping ports re-open, and how prices are likely to rule in order to render the demand in this country equal to the supplies which the shippers abroad are preparing for it. Our Swedish correspondent to whom we have already referred throws out some very useful hints in this direction in his letter of November 18th, published last week on page 356. He had already repeatedly dwelt on the heavy stocks accumulating in Sweden, notwithstanding the shipment this year of 100,000 standards more than in 1881, and in fact the largest export ever known from that country, and he now warns the millowners of the state of the markets abroad, in order to induce them to put some limit on the quantity to be cut this winter, if they do not desire to see prices go down in the scale below a remunerative point. But we all know to what this sort of admonition generally amounts. Everybody admits its correctness, but each in his own case is apt to find some excuse for not observing it. We all think that if we curtail our transactions, some neighbor in the same line will extend his in the same proportion, and the only result of our cautious reserve will be that he takes from us a part of the business which we ought to have done. "Besides," they reason, "are there not other countries which will flood the British markets by all that we refrain from shipping?" Then they resolve probably not to limit the cut so much as to try and diminish the cost of obtaining it. The apprehensions suggested form a good argument for abridging their expenses, and the lumbermen are informed that their services are not required to the customary extent and they can only be fully employed at a reduction of wages; so that, if prices must give way, the millowners may at any rate be able to suffer the abatement without being losers on the sales they effect. Though this may not be literally true of the state of trade in Sweden, it is towards this sort of conclusion that it is drifting by the force of circumstances and the present state of the markets, to which it looks for the disposal of its produce. And as Sweden, with which Norway is associated as the prime source of the British supplies of building timber, leads the other European shipping countries, we may assume that as great efforts will be made this winter as ever there were before to get as much timber forward for shipment next season as the resources of the merchants will enable them to accumulate at their respective wharves.

From our North American Colonies no great increase of supply is likely to come to market. There has been some falling off in the shipments thence this season, which it is too late now to make good; and as prices continue firm there, and freight is too high for speculative charters, it is likely that no more than a good legitimate business will be done from that direction next year. The south country pine, however, is irrepressible, and knows no diminution. It is said also to be growing in favor, and perhaps no timber imported is chargeable with less waste in conversion, as it can be bought square-edged in considerable bulk, and is seldom objectionable on account of coarse knots and shakes.

In the estimation of probabilities as to future prices we have always considered that this wood was hardly sufficiently taken into account; but it is a material which steadily operates against an advance of prices, and is likely to be a greater check on them hereafter than it has hitherto been. Old contract forms still demand the kinds of timber that have been held in preference for ages, because they were chiefly accessible in those days, but as the utility of pitch pine is more generally known, its cheapness in proportion to quality will have its natural consequence, and by and by it may be insisted on in place of other kinds that have hitherto been preferred to it. At all events, it is coming to this country in increasing quantities, and has to be reckoned with when we are estimating the probabilities of our supplies and the tendency of prices. If trade continues good—which is not now so flourishing as it has been—the prices of imported timber may hold their own at about the level of the present rates both abroad and at home; but there does not appear to be anything in the facts at present available to justify us in looking for better prices next year than the average of those which have been realized during the present.

THE TRADE IN QUEBEC.

Quebec, Dec. 13.—This morning's *Chronicle* has the following remarks on the lumber trade during the year:—

"In this, the chief trade of the port, we are informed that the season has been fairly prosperous. At the commencement of the season shippers had only very small wintering stocks to deal with, but these were augmented in June by the arrival of about three million feet of white pine from the Ottawa, the greater portion of which was timber of the previous year's make, stuck in the streams in consequence of the unprecedented lowness of the rivers, the balance being new rafts of small average; and all this was rapidly absorbed as the spring and summer fleet continued to arrive, so that when the main bulk of the new wood reached market, the merchants were comparatively bare of stock, a position which was turned to practical account by lumbermen who held on to their rafts until shippers found themselves forced to meet the position. Notwithstanding the comparative inactivity that was evident in the months of July and August, a reaction quickly set in when the fall ships began to make demands upon the limited stocks in shippers' hands, and during the following two or three months very large purchases were made by the trade at full prices, notwithstanding the inferior general character of the Ottawa pine this season. Really prime rafts are said to be quite the exception, and it is also equally rare to meet with rafts over 53 feet average, so great is the falling off both in size and quality, and it is said that this will become more apparent each year.

"Although we find at the close of the season that the stock of white pine is about two million square feet in excess of last year, it must be kept in view that this winter there is not a single raft left behind in the Ottawa streams, against about two million last year, and in addition to this, it is known that new timber will each year be later in reaching market, and very few rafts of the better class of white pine can possibly be delivered in Quebec before August. This remark stands good also as regards waney board, pine, oak and other hard woods from Western Canada, Ohio and Michigan. So that, regarded as a whole, the wintering stocks of timber in Quebec will be barely sufficient for the loading of even a small spring or early summer fleet.

"The enormous advance in the cost of all descriptions of labor employed in the woods, and the enhanced value of provisions will increase very materially the cost of production, and it has this autumn been almost impossible to obtain the usual number of skilled axemen, many manufacturers have curtailed their operations in consequence.

"Oak is low in stock, very little wintering at Garden Island, and the production of Ohio and Michigan wood is now in so few hands that it is not anticipated that this wood will ever be cheaper in this market than it is to-day, and the commoner description of Canada oak is not appreciated by the trade at even a heavy reduction in price.

"In pine and spruce deals we are informed that the English markets have been far from satisfactory, the London market especially having been paralized by large stocks of last year's importation remaining in the hands of certain importers there, and causing buyers to hold off in the belief that they would be able to buy on easier terms. Shippers must obtain higher values for both these articles if they are to continue to export them, and as the manufacture will probably not only be curtailed this winter, but the cost of production will be materially increased, an advance in price must follow. All contracts made for next year's delivery of spruce deals have been at an advance, and all the stocks of this wood are now in the hands of shippers.

"With the United States, trade in small lumber during the past season has been good, and anything for sale could be disposed of there for good prices. Lumber shipments to the River Platte are also on the increase, the majority of which are made from Montreal. Deal shipments to England by steamer are also largely made from Montreal, but all from account of Quebec shippers.

"It might be well to draw the attention of those interested in the deal business in Quebec to the very large quantity that have been shipped this year in Montreal, the chief inducement being that the cost of loading ships there is so much lighter than in Quebec, and both steamers and sailing ships give a decided preference to taking their cargo there. Montreal as a shipping port for deals will in consequence of this become each year more popular, and unless considerable restrictions are removed in regard to the labor question in Quebec it is becoming quite evident that this branch of business will go from us in a very short time.

"One feature which has told heavily against the trade this year has been the exorbitant rates charged by the English marine insurance companies, rates for which there does not appear to have been any proper justification, and it would seem to be a good time for capitalists on this side to establish a company or companies which will charge reasonable rates on all risks.

JUDGMENT REQUIRED.

The *Northwestern Lumberman* says:—To the unthinking, lumber is lumber, and they do not reflect that there is anxiety on the part of the manufacturer to turn out a season's cut that will all be called for. The lumber manufacturer must anticipate the future the same as the dealer in dry-goods or any other commodity. He is liable to have a large stock of certain sizes on hand that is slow of sale, and possibly will not sell at all except at a reduction that cannot be afforded, the same as the merchant in other lines is liable to have a stock of unsalable goods left on his hands. The general use of barbed wire for fencing has taught the manufacturer that he must saw less of his timber into fencing than he did a few years ago. He must anticipate the amount of building that will probably be done, and if he calculates wrongly the dimension is his yard will be a drug, or he will have orders for it that cannot be easily filled. It is seemingly an easy job to draw logs into a mill and slash them up into lumber, but it requires good judgment to know how to saw them into the sizes that will be most called for.

The Growth of London.

The *Timber Trades Journal* says:—

"Perhaps the readiest method of conceiving what the cosumption of wood in London must be is to make note of the fact that during twenty years the population increased from 3,222,000 in 1861 to 4,764,000 in 1881, or an incresse of 47 per cent. London, then, has been increasing at a rate nearly double that of the rest of England and Wales, which has increased at the rate only of 25 per cent. London has 100,000 more inhabitants than the whole of Scotland, and about 400,000 only less than the whole of Ireland, while it exceeds in population such countries as Sweden, Holland, and Portugal. Further than this must be reckoned the circumstance that during the past twenty years it has become a much more general practice to reside outside London. In reckoning the consumption of wood in the "Modern Babylon," the immensity of suburban London must be taken into additional account.

DAUGHTERS, Wives, Mothers, look to your health! The many painful and weakness diseases from which you suffer, dispairing of a cure, can be remedied by that unfailing regulator and purifying tonic, Burdock Blood Bitters. Ask your Druggist for proof.

TIRED OF SUFFERING.

An Ex Police Officers Story—The Agony is Over—"It Did Not Fail Him."

[*Sacramento (Cal.) Record Union.*]

Mr. M. Humen, proprietor of the Pioneer Store, No. 102 J street, is now one of the happiest men in Sacramento, whereas a short time since the fields for him strove in vain to look gay in their garb of winter-green, and the sunshine of California was as a glimpse of the midnight sun at Spitzbergen. He had the rheumatism. What man tortured with rheumatism can delight in in the beauties of nature or care a fig whether the sun shines or not? Mr. Hymen did not know what to do about it. He had taken the prescriptions of physicians, but the dull, dead ache and the horror and dread agony were still there. The heavens to him were as though covered with the pall of unending night. Others might smile, but Mr. Hymen found no cause to allow a ray of mirth to creep into his face. This sort of thing had gone on with him at intervals for years, and there seemed no help for him But the poet tells us that the darkest cloud has a silver lining. The darkest hour is always just before the dawn. There was help for him—relief present and permanent for his racked body. At last some one told him of the Great German Remedy, St. Jacobs Oil. "What! use a mere liniment, after exhausting the skill of doctors? Why, it is madness to talk of it!" "Well, just try the Great Remedy," said the voice of his friend. He tried it. "What is this?" Relief! He tried it again. More relief! "Is this the wand of the Magician? Yes, it is relief—sweet relief, after wakeful nights of agony and days long drawn out with "suffering?" At last he had discovered the solution of his trouble. He was cured. Since this happy recovery the gentleman cannot say enough in praise of the Great German Remedy. He advises all to use St. Jacobs Oil for rheumatism. He says there is nothing under the dome of the universe comparable to it as a pain annihilartor. His recommendations in the past few weeks have been the means of selling hundreds of bottles of the wonderful specific, and many are glad of the time when he urged them to use it. His was a wonderful cure.

Mr. W. B. Ferrall, the well-known policeman of this city, has also felt the powerful friendship which the St. Jacobs Oil extends in the hour of physical suffering. Mr. Ferrall was severely afflicted with rheumatism. He got tired of suffering, and determined to call in the aid of the grand old specific. It did not fail him. The disease was deep seated and declined to yield without a struggle; but the application of two bottles of the Oil made it fly away and cease from troubling. He is now well and hearty. He recommends the afflicted to rely on St. Jacobs Oil as the most ready and efficient cure for pain in the world. Captain O. O. Laraway, who runs that most thriving and well stocked grocery, corner of Sixth and N streets, is a great sufferer from neuralgia. While the reporter was in there the other day waiting his turn for supplies, the Captain told him that the Great German Remedy was a powerful liniment. It has relieved him of neuralgia, and given him many hours of ease. His clerk also owned to having had the backbone taken out of some ugly rheumatic pains which had possessed his legs, much to his annoyance, for some time.

The foregoing should convince even the most skeptical that the article in question is indeed a great remedy and conquerer of pain. "We endorse it," is heard on all sides.

TREE CULTURE.

A Minnesota farmer says:—I have five acres of young forest trees growing. Broke the land in 1875—6 and sowed to grain for three years, and planted to corn the next year, and trees planted in with the corn. Trees consist of cottonwood, box-elder, and Lombardy poplars. The cottonwoods are seedlings pulled up along the Redwood River, also the box elders; Lombardies were cuttings. The cottonwoods grew from three to five feet the first year. The box elders did not make much growth the first season, barely lived through. About two-thirds of the cuttings lived and made a growth of two feet. The cottonwoods have continued to keep the start, and are now from ten to twenty-five feet high and make a splendid wind-break. The box elders are doing well now, but do not grow as well as cottonwood, but make a fine shade tree. The Lombardies are growing fast now. I use the plow when they are small; after they get larger the cultivator; am careful not to cut the roots when cultivating. Have never mulched them; think good cultivation is better.

TROUBLES IN THE TRADE.

The Montreal *Star* of Dec. 13, says:—A meeting of the creditors of Messrs. W. J. Pope & Co., lumber merchants, of Charlemagne, P. Q., was held yesterday afternoon in this city, when a voluntary assignment was made to Messrs Thomas Darling and Charles Lacaille. A large amount of litigation may be expected in connection with the estate, as the assignees have been ordered to contest the deed of transfer of the establishment at Charlemagne and the timber limits to the Exchange bank and to Messrs. Brossard, Chaput & Co., which was made a few days ago. Immediately upon this transfer being executed, a seizure was taken out by the other creditors, the affidavit in support of which alleged that the firm was making away with its property with intent to defraud the creditors. Upon the action being taken the firm called the meeting of creditors alluded to above. The claim of the bank to the lumber will also be contested. This claim is based on the fact that they held warehouse receipts on the logs, which extend to lumber derived from them. The unsecured liabilities of the firm amount to $94,000, while the assets are nominally $83,000. In addition to this there are mortgages amounting to $36,500 on the real estate, which are fully secured. The majority of the creditors are in Montreal, the largest being the Exchange Bank, $50,000, and Messrs. Brossard, Chaput & Co. $15,000.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery, decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto, Ont.

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:

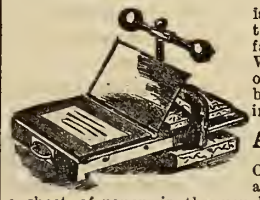
ZUCCATO'S PAPYROGRAPH



is a new invention for the rapid production of fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.
Autograph Letters
Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet
500 COPIES PER HOUR
may be printed upon any kind of dry paper, or other material, in a common Copying Press.
This is the Most Simple, Rapid and Economical Process yet Discovered.
THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.
The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.
For specimens of work, price-list, etc., address with stamp.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. JAN. 1, 1883.

A NEW VOLUME.

WITH this number we begin a new volume of the CANADA LUMBERMAN, and we cannot look back without congratulating ourselves upon the success of our venture, for such the establishment of a new journal always is. We feel that for this success our cordial thanks are largely due to our subscribers, correspondents and others who have given us support, encouragement and assistance, not forgetting that most important class in a business point of view, the advertisers who have favoured us with their patronage.

From our own observation and from the assurances of many gentlemen occupied in the lumber business we felt that there was not only room, but a demand, in Canada for a journal specially devoted to the interests of the trade, and the result has shown that we were not mistaken. To give an idea of the kindly appreciated of our labours we will give brief extracts from two out of many flattering communications we have received.

Mr. J. K. Ward, of the Mona Saw Mills, Montreal, writes :—

"We are pleased to receive the CANADA LUMBERMAN and to be counted among its readers. We receive other papers devoted to to the lumber interests, but none more acceptable than yours. We hope it will meet with all the success it deserves."

Messrs. Olmstead & Appleton, of Collingwood, write :—

"We are much pleased with your paper, being a journal much needed, and wish you every prosperity."

With such encouragement, other instances of which we might give, we feel nerved to persevere in our rather arduous task, and to make further efforts to render the CANADA LUMBERMAN in the future still more useful and welcome to the great industry whose interests it serves. We will conclude by thanking these kind friends and others who have given us their support in a more tacit manner, and to all of them we heartily wish a happy and prosperous New Year.

LARGE quantities of square timber for the ship yards, and spiles for docks, are being hauled into Bay City, since the snow-fall.

PARRSBORO', N. S., owns 17,000 tons of shipping, and over 16,000,000 feet of deals and deal ends were shipped from there this season.

THE River and Streams Bill which has been twice disallowed by the Dominion authorities has been introduced a third time in the Ontario Legislature.

CUTLER & EDDY will get out 3,000,000 of cedar logs in the country around the St. John river, on the borders of Maine and the province of New Brunswick, where operations are heavy. They will turn out 30,000,000 shingles.

A Kingston despatch says Mr. P. McLaren's Mississippi saw mill is to be doubled in capacity, and laths, shingles, and pickets manufactured. This will be the centre of McLaren's operations for the cutting of lumber and timber. The chief depot for the shanties is near this place.

A DESPATCH from San Francisco, dated Dec. 22, says :—San Francisco, 22nd.—The coast survey steamer has returned from a seven months survey of the southern coast of Alaska, where several excellent harbours were discovered. The officers speak enthusiastically of the timber resources of that region.

IT is said that Mr. James Bethune will go to England at the end of January to move before the Judicial Committee of the Privy Council for leave to appeal from the decision of the Supreme Court of Canada in the celebrated case of McLean *vs.* Caldwell. This is the case in reference to the use of streams by lumbermen.

THE *Northwestern Lumberman* says :—Hurd, Hotchkiss & McFarlane, the Adirondack wilderness invaders, have made an application to the state land commissioner at Albany for all the unsold lands belonging to the state, aggregating 4,584 acres in township 14 Franklin county. The land was ordered sold at $2 an acre—cheap enough.

North and South says :—It is stated that a western furniture firm has sent a man to the Piedmont region of the south and thereabouts with orders not to return until he has secured 100,000 acres of suitable woodland; while others are taking similar action. The value of southern timber is gradually becoming known. About the time all the choice woodland in the south is gobbled up by western and eastern investors, our own people will become conscious of what vast wealth we possess in our forests.

ON a tract of pine near Grayling, Mich., owned by Englemann and C. B. & E. C. Lewis, two camps are located. There are 70,000,000 feet on the tract, which surrounds a lake that is five miles long, and at the nearst point three and a half miles from the Manistee river. Into this body of water the logs will be rolled, and towed to the point in question, from which a railroad will be built connectiong with the river. The logs will be drawn from the lake and loaded on cars by means of an endless chain.

THE London *Timber Trades Journal* says :—Holders of spruce deals express the utmost confidence as to prices. The opinion has been openly expressed by large holders on the west coast that they will yard and hold rather than accept any other than renumerative figures. It is said that even this side of the new year we may possibly see a small advance occur. A member of a leading firm of west coast importers has remarked that he confidently anticipates that £9 will be realized during the early months of the forthcoming year,

---

THE Manistee *Democrat* says :—A quarter of a mile of railroad track is being laid from the new depot grounds to the edge of the lake, just north of M. Englemann's saw mill, for his use in shipping lumber and bringing logs to his mill. He has contracted with the F. & P. M. road to haul 3,500,000 feet of logs from Chase to his mill this winter.

A RECENT work on Florida says :—It is a fact familiar to lumbermen in Florida that less than thirty years is necessary to restore to land once cut over a new supply of mill stocks. Indeed, it has been authoritively asserted by parties familiar with the premises that in the country tributary to Pensacola, even with her immense mill capacity, the timber grows faster than it can be cut off.

THE Montreal *Gazette* informs us that :—"Lumbering operations on a large scale are being proceeded with in almost all sections of St. Francis District. In the township of Stoke a large amount of spruce deals are being got out, the lumber in the log to be driven to Windsor and sawn there for the Quebec market. The British American Land Company are also operating largely in the township of Orford for their mills in Sherbrooke, the Berlin Mills Co. at Lake Megantic and Messrs. G. B. Hall & Co. in the same locality on the Chaudiere."

AT Ottawa, on Thursday, Dec. 21, the timber limits belonging to the firm of Thomas McTiernan & Co., which have been the subject of litigation for nearly three years, were sold under an order of the Court of Chancery, and the prices obtained were the highest yet reached in this district. Thirty square miles were sold to Perley & Pattee for $78,000; 50 square miles to Mr. J. R. Booth for $61,500; another lot of 50 square miles to Mr. Booth for $46'500, and a further lot of 15 square miles to the same gentleman for $22,100. The total amount realized was $208,100.

A VERMONT correspondent of the *Northwestern Lumberman* says :—Our forests are being cut over too fast. Ten years at the same rate of cutting will exhaust the spruce forests of northern Vermont, and we cannot now see what is to take the place of lumber, or where a supply is to come from. From careful inquiry, I think that in this little north corner of Vermont we produce fully 80,000,000 feet of spruce, besides hardwood lumber and cedar shingles to a considerable extent. In addition to this, some 40,000,000 feet are taken from our state and run down the Connecticut river to Massachusetts and Connecticut yearly.

THE *Lake Superior News* says :—The lumber business of Duluth is by far the most important industry yet developed here. To show our readers how this business has increased we would state that during the winter of 1880 only about 80,000,000 feet of logs were got out in this district, and last winter 175,000,000 feet were cut—showing an increase in 1881 of more than one hundred million feet over the cut of 1880. This year there is a corresponding increase, the total being 312,000,000 feet, showing an increase for this year over last of 137,000,000. Itemized reports from the different camps show that there are some 3,500 men at work, a good sized army, but some put the number of men in the woods as high as 4,500.

THE *Lake Superior News* says :—A number of Michigan men are reported to be in Duluth trying to purchase mill sites. There is plenty of chance to buy such property in Michigan and we venture to say we can show up a better mill site here on Portage Lake, by a———site, than any they have in Duluth.—*Hancock Journal.* It is quite evident that the editor of the *Journal* has never visited Duluth or he would never talk in such a reckless manner as the above. We would like to inform him that no place on Lake Superior has as desirable sites for saw mills as Duluth. Again Mr. *Journal*, lumbermen desire something more than good sites. They want a good market and a vast supply standing pine, And this is the reason Michigan men are coming to Duluth insted of locating on Portage Lake,

PACIFIC COAST REDWOOD.

The wastefulness of this lumbering is one of the striking features of the scene. Only the largest trees are cut, those measuring less than two feet in diameter rarely being touched, and the axe is laid, not to the roots (though they are not thick and widely divergent, considering the height and weighs they support), but some distances above, so that in very large specimens the massive stump, upon whose flat top you might build a comfortable house, stands ten or twelve feet above the ground, and contains hundreds of feet of sound lumber, which must be left to rot or burn. Then many trees are broken by their fall, so that large parts of them are useless; other parts may be knotty, or crooked, or inconvenient to drag out, and so only half of a great trunk will be utilized. Huge logs are consumed, also, in road-making and bridge-building in the hills, and dozens of small trees are crushed by the fall of their greater companions. Then, when a district is pretty well cleared of its best timber, fire is set in the bush and prostrate trunks. Feeding eagerly upon the resinous woods, half dried and broken, it gathers so much heat that the saplings are nearly all killed, and the flaky tinder-like bark of the larger trees is singed in a way which must greatly injure and often destroy them. Moreover, these fires, fanned by the gusty breezes rushing in every afternoon from the ocean, often get beyond control, and sweeping through the oily tops and brittle trunks, spread blackened ruin over miles and miles of precious forest. *Precious*, however, it seems never to occur to the lumberman these forests are; yet he is probably no more wasteful and careless here than elsewhere, and finds his match for heedless extravagance in nearly every pursuit that deals in what nature furnished us at the outset in abundance, but replaces only very slowly, giving abundant leisure for our repentance. The spendthrift lumberman is bad enough, but no worse than the wasteful oysterman or buffalo-hunter, reckless of the future. It is, or ought to be, a matter of rejoicing to everybody that the Forestry people, under Mr. Sargeant's guidance, are paying especial attention to preserving as far as possible the magnificent forest of the Coast Range.—Ernest Ingersoll, in *Harper's Magazine.*

A HOLIDAY SLAUGHTER.

The *Northwestern Lumberman* says :—The spruce and fir forests of Maine are now suffering extensive inroads to supply Christmas trees and evergreens for the holidays. The business is particularly heavy along the line of the Knox & Lincoln road, having grown to an important extent year by year. The trees leave the state at the rate of many carloads a day while the holiday traffic lasts, and, as everybody knows, are used in a variety of ways for trimming stores, churches public places, homes, etc., before the conventional Christmas eve arrives. The state of Maine is a main source of supply, though evergreen is obtained from various sections of the country, The supplies have been so drawn upon that the forests are showing it, and the sacrifice continues, and will so long as people cry for luxury, and the handlers can coin money, as many do at present. If 100,000 young trees were swept away yearly, even in Maine alone, it would be only the conservative and sensible ones who would lament. The merry-makers rarely reflect that they are denuding more of nature's tree store for one item of general enjoyment than all the forestry societies in the country could replace in years. Warren is one of the great distributing points in Maine for the sale of evergreens for Christmas, and scattered through the state are several firms doing an immense business.

TROPICAL TIMBER.

The furniture and dye-woods that abound in the forests of the West India Islands, on the bays, inlets and rivers of the Carribean coast of northern South America, and in the maritime regions of Central America, Guatemala, Yucatan and Mexico, have for over 200 years been an important feature in the commerce of America and Europe. The forests that supply these woods have been cut away along the tidewater to such an extent that it is now more costly than it was to get the timber to places of ship-

ment, and the governments of the several Spanish American republics that embrace these forests are making efforts to ccustruct railroads from the seaports to interior points. British Honduras, Guatemala, Spanish Honduras, Costa Rica, Nicaragua, Colombia and Venezuela are awake to the importance of railroads, and lines are in progress of construction in those countries that will penetrate their vast forests, and bring to the coast cedar, sapodilla, mahogany, zapote, fustic, logwood, and all the varieties of furniture and dye woods. These countries abound in valuable woods, not yet kuown to commerce, that will be brought to view when the localities in which they grow are opened up by railroads. Within the last three or four years several enterprising merchants of New Orleans have turned their attention to this valuable trade. The house of H. Otis sent men into various intertropical countries to procure their peculiar woods, and purchased several schooners to freight them to the New Orleans market. Since this undertaking the trade has greatly increased, and the dealers at the Crescent City hope to rival eastern markets in this branch of commerce.—*Northwestern Lumberman.*

FORESTRY.

The Chicago *Lumber Trade Journal* says:—Much valuable reading has of late been published in reference to the relation of the influence of forests upon streams, and those who perhaps kuow best, from a scientific standpoint, urge a consideration upon the most plausible ground. Ample and commanding illustrations to support their assertions have been produced, with many facts to which the thoughtful are inclined to attach weight.

It is within, doubtless, the memory of many observing men who have from necessity been constrained to plant trees after settling in a section where there was no timber to recall the moisture that followed dryness of the soil, when the small sprigs or the seeds which they had planted or sown years before were grown to a considerable size, owing of course to the nature of the leaves of the trees to retain moisture. Wherever there have been forests, streams of every size could be seen, but just in the ratio that the timber was removed in any quantities the streams diminished in volume, until not a few instances bore witness of the complete disappearance of the water almost simultaneous with entire depletion of the forests. The truth of these very instances were in some cases corroborated by the dried channel filling up with water, when after some years the old forest land again reveled in the product of new trees.

This points strougly to the necessity of not merely reforesting for the supply of material which will always be needed in the construction of building and improvements, but because of the varied mechanical and commercial enterprises which rely upon the river. The past in this respect holds out to the present an ominous warning which wise discretion will heed and obey, and instead of lands disrobed of the great timber resources, we will be able to see in teeming forests the fruitage of wise judgment and careful work.

ADDITIONAL IMPROVEMENTS AT THE TANITE CO'S. WORKS.

It is only a few months ago, that we chronicled the enlargement of the Tanite Works by the addition of several large building, which are moreover among the most substantial structures of the kind in the county. But "Tanite" is a synonym for busy activity and energetic progress. It would be unusual for a monthly visitor to fail noting on each return some important improvement. The new store house, 24x40, two stories and attic, which became a necessity with the rapidly increasing amount of work turned out, is now thoroughly finished. The Company have also just built a new casting shed 16x30, one story high. They have also just completed the extension of the boiler shed, adding 19 feet to the original one, which is now 50 feet long. They have just put in place a new horizontal boiler, built by Tippet & Wood, of Philipsburgh, N. J. It is one of 65 horse power, fifteen feet long and five feet in diameter. It has 45 tubes which are four inches in diameter. This boiler is in addition of course to one of the same size in present use.

They have also just added to their machinery a new Worthington double acting steam pump, to be used as an auxiliary to the "Niagara" (Campbell & Hardick) pump now in use, both for boiler feeding and for use in case of fire.

A REMARKABLE INVENTION FOR THE MANUFACTURE OF SIDING.

The *Lumberman's Gazette* of Bay City, Michigan, says:—The manufacture of rift-sawed siding is becoming quite a prominent industry in Manistee, and already several machines have been invented for its production. Only a little while ago Horace Tabor came out with a machine, and was followed very closely by S. Babcock with another. And now along comes another, the product of the inventive genius of R. G. Peters.

Mr. Peters' machine differs principally from the others in that the siding is manufactured from the whole log—the other machines requiring that the logs first be quartered.

When the log is rolled on the carriage a couple of jacks, directed by a lever in the hand of the sawyer, elevate the log to the proper height, and it is then fastened in the centre of each end by stocks, which are connected with the set gear. The set is so arranged as to give any desired thickness or taper. The log revolves around until it is entirely circled and cut into siding. Two saws are on a perpendicular shaft and cut the siding the proper width, while another on a horizontal shaft cuts it from the log. These saws are in an adjustable saw frame, and can be raised and lowered in a instant, to accommodate any size log. If the log is large enough, after the first cut around is made, the saws are lowered and the operation repeated until there is nothing left but the heart, which is invariably consigned to the shingle mill and is there manufactured into shingles. The machine also cuts flooring as readily as siding. Its capacity is put at 30,000,000 feet of siding per day.

The chief advantages in the manufacture of rift-sawed siding are, that more clear lumber can be got out of a log than by any other means. The saw cuts toward the centre of the log, and of course does not cross the knots. The siding is not nearly so apt to warp or check.

Lumbermen in St. Louis.

ST. LOUIS, Dec. 20.—Seventy-one persons representing the lumber interests of Michigan arrived here to day. They represent firms in Grand Rapids, Muskegon, Grand Haven and other western Michigan points which are handling 1,250,000,000 feet of lumber annually. The lumber stacked up awaiting shipment in the cities of Muskegon, Whitehall, and Grand Haven, and Spring lake amounts to 300,000,000 feet and the furniture interests of Grand Rapids alone amount to $6,000,000 annually, To-day these dealers met the lumber dealers, planing mill owners, and heavy furniture dealers of St. Louis and entered into direct business relations with them. The new departure is made practicable by the extension of the railroads throughout the western part of Michigan and the connections just made with the Wabash and other lines, the enterprise of the lines most interested and the readiness of the wide-awake business men of the region to improve an opportunity. The excursion will be continued to Kansas City, and the delegations will return by way of Chicago, whose lumber dealers will by this new move be cut out of a vast amount of business.

A Camp Scourge.

The hardy pioneers who first settled the country north and west met with untold hardships and perils. They not only had the wild animals of the forest to contend with, but were opposed by savage hordes. All that they suffered in various ways will never be known. In those days men went abroad and took their chances on what came, but such has been the advance in civilization that a single panther in a section of pine woods will scare the gall out of all the loggers in the district. Near a camp in the vicinity of Grayling, Mich., one of these animals has recently been several times seen and heard, its wild half-human cry falling with a chill on the ears of those who heard it. One of the men became acquainted with the savage cat in a way that he did not appreciate. While standing on the banking ground he observed the animal swiftly stealing toward him with characteristic slyness. Reaching a point a few feet from him it crouched for a spring, the swish of its tail sounding ominous enough to the unarmed man. At the right moment the cries of a number of men who came up frightened away the panther. The men have now become so thoroughly frightened that one of them could not be hired to go away from camp after dark.—*Northwestern Lumberman.*

Sale of Timber Limits.

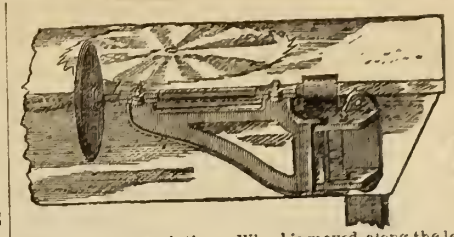
The Ottawa *Citizen* of Dec. 22nd, says:—This afternoon the timber limits belonging to the firm of Thomas McTiernan & Co., and which have been the subject of litigation for nearly three years, were sold under an order of the Court of Chancery in the suit of McTiernan *vs.* Fraser. There was a large attendance of prominent lumbermen from the Ottawa Valley, and the bidding was very brisk. The sale was conducted by Mr. W. M. Matheson, the Master in Chancery here. The prices obtained were the highest yet received in this district, although the limits are very valuable. Parcel No. 1 containing thirty square miles, was purchased by Messrs. Perley & Pattee, for $78,000. Parcel No. 2, containing fifty square miles, to Mr. J. R. Booth for $61,500. Parcel No. 3 containing fifty square miles to Mr. J. R. Booth for $46,500, and parcel No. 4, containing fifteen square miles, to Mr. J. R. Booth for $22,100. The total amount realized was $208,100. The terms of sale were ten per cent cash, twenty-five per cent within twenty days, and the balance within four months from date of sale.

Hogs and Young Pine Trees.

A correspondent writing from Johnsonville, S. C., incidentally mentions a curious instance of the influence of animals in controlling or preventing forest growths. It appears that the fondness of hogs for the juicy roots of young pines leads them to seek them assiduously, so that where hogs are allowed to roam in that region one can hardly find a young long-leafed pine in a thousand acres of pine forest. There being no young trees to take the place of the old ones used up by the lumbermen and turpentine gatherers, that species of pine timber is rapidly being exterminated.

THE recent fire in Kingston, Jamaica, has created quite a demand for vessels to load lumber for that port. Four have been chartered from St. John, N. B., within a few days.

THE Orillia *Packet* says:—Mr. P. Christie has a number of men employed in framing timber for a new mill, to be erected upon the site of the old one at Sturgeon Bay. The new mill will be 44x100, and have a capacity of about 40,000 feet of lumber per day. It will also contain 2 shingle and 1 lath machine, all provided with the most modern improvements and facilities. Mr. Christie expects to have his new mill ready for manufacturing next March. During this winter he intends to get out a large stock from his extensive limits and now has actually four camps in operation, as well as many jobbers at work. A well known Orillian, Mr. W. E. Armstrong is mill foreman, which position he has held for nearly three years.



To MILLMEN!

HODGSON'S
Patent Saw Grinder

Is a new, efficient, and exceedingly cheap machine and is equally well adapted to grinding long and round saws of every description. Wheel is moved along the length, and in the depth of the tooth, and can be placed just were wanted as easily as a file. It is just THE THING for mills, cutting from one to five million feet of lumber, and costs no more than one-fourth to one-tenth the price of little better machines. It is patented in United States and Canada, and is made in Welsport, Pennsylvania, and in Amherst, Nova Scotia.

Hodgson's Patent Monitor Shingle Machine

combines, at a moderate price, more points of excellence than any other. Jointer is built in machine, a few inches from the saw. The cast steel feed rolls are opened by a foot lever, and grip the block like a vice. Traverse of carriage to suit large or small stock, is under control of operator when running. Will run for days without cutting a shim. Warranted to cut, with one attendant, three thousand in an hour, under forfeiture of $100. Send for circulars to

THE SUBSCRIBER OFFERS A TRACT OF

8,000 ACRES

Of PINE LANDS, in St. Louis County, Minneso carefully selected and estimated to cut **FORT MILLION FEET**, well located on good drivi stream, tributary to Duluth.

A. McCALL,

6L1 Lumber Merchant, Simcoe, O

QUEBEC.

The *Chronicle* of Dec. 14th says:—The annual trade circular of Messrs. J. Bell Forsyth & Co., merchants of this city, has just been published at our office. As usual this valuable *resume* of our most important branch of trade is carefully and reliably compiled, and reflects the greatest credit on the house of our enterprising townsman, from whose establishment it has been issued. The circular shows at a glance, the supply, export and stock wintering, together with comparative statements, current prices, &c., &c. We need not impress on our readers the advisability of their securing their supply of copies early in the day, so as to meet the outgoing mail steamer for Europe, which leaves Halifax on Saturday next. Meanwhile, we must take a rapid glance at the contents of Messrs, Forsyth's circular. There has been considerable falling of in the number of arrivals of ocean steamships as well as of sailing ships, dnring the year, but the number of vessels trading to the lower St. Lawrence and Maritime Provinces, on the other hand has increased somewhat. On the whole, the year now drawing to a close, has been a satisfactory one to our business men, all things considered. There has been no over production, and the trade in lumber and timber as a rule has been conducted on a sound and healthy basis. The manufacturers have been especially successful, and the past winter has been propitious for operations in the woods. The season opened without much request for white pine, the great staple of the Quebec trade. The export houses were apparently well-supplied, and the outside demand was limited, and beyond a few rafts which had been contracted for during the winter and early spring few transactions of any volume took place until about August, when something better was reported. Some lots were disposed of at fairly renumerative prices to the producers, and by the end of the season but few lots remained for sale in first hands. The present stock wintering, though somewhat in excess of that of last year, is under the average, and shows the whole quantity available for spring and summer needs. There is still a difficulty, noted in the circular, in procuring first-class wood, and many of the old limits have become exhausted or have passod iuto the hands of mill-owners. A portion of the new and more remote timber regions has been, up to the present time, inaccessible to the lumberman. In the stock reported to be on hand, there is a larger quantity than usual of inferior wood. Much of this, however, will be utilized in the extensive public works and other improvements now in course of construction. The estimates of the probable "cut" on the Ottawa and St. Lawrence for this winter, show that the supply for 1883 will not more than equal that of 1882, premising that the entire crop reaches market next season,—a supposition by no means certain. The demand for Canadian white pine has been very fair throughout Great Britain, and the stocks at present held in the priucipal markets there, are light.

This comparative statement shows the supply export and stock of white pine during the years 1881 and 1882:—

		Supply	*Export.*
1882	Square ..... 8,053,086 Waney 3,127,129		7,912,160
1881	Square .....6,029,041 Waney 3,065,274		9,101,880
		Stock.	
1882	....	6,532,152	Square
	....	3,354,943	Waney
1881	....	4,526,102	Square
	....	1,519,950	Waney

In red pine, the supply, though light, has been ample, and the stock largely composed of indifferent quality. Choice wood of good average and girth has been in fair demand, but small and inferior wood has not gone off well, considerable difficulty being found in placing it. In many instances the prices realized could not have proved remunerative to the manufacturer. The decline in shipbuilding has stopped the demand for very common wood. Small quantities continue to be sold, however, for local purposes.

	Supply.	*Export.*	*Stock.*
1882	1,474,871	1,024,680	2,362,624
1881	1,945,720	922,000	2,145,833

In oak, we learn that there has been good demand for prime wood, just now a scarce article. The difficulty in obtaining choice standing timber, the increased cost of manufacture, and the high freights, have made serious inroads in the profits of the producer, though rates have lately assumed a slight upward tendency.

	Supply.	*Export.*	*Stock.*
1882	1,316,719	1,957,320	1,362,153
1881	2,994,477	1,883,360	1,916,622

The market for elm opened out very dull, and timber was sold at unprofitable rates, but towards the close of navigation prices improved a little, and to-day are reported firm for next year's delivery. The indications at present seem to augur a light production.

	Supply.	*Export.*	*Stock.*
1882	 714,549	778,360	530,611
1882	1,027,670	797,160	499,912

Good large white ash is scarce and commands a fair price, while small and inferior wood is neglected. In 1881 the supply was 408,798 against 310,769 in 1882, while the export and stock amounts are shown as follows:—

	Export.	*Stock.*
1882	297,040	212,422
1881	355,680	210,101

In birch, the stock is light and difficult to procure in any quantity, while the production for next season's delivery is very uncertain. This table exhibits the state of the market:—

	Supply.	*Export.*	*Stock.*
1882	261,920	513,680	78,413
1882	110,488	273,880	51,092

Pipe staves have been scarce and in request throughout the season. A considerable advance in prices has taken place, while puncheon staves have also been in fair demand.

1882	Pipe..... 585	450	293
	Pun.....1,430	850	1,007
1881	Pipe..... 418	480	226
	Pun 671	602	280

In pine deals the state of the trade is thus epitomized. In the early part of the season there was a very fair demand, but during the summer months there was less enquiry. Towards the autumn, however, a much better feeling prevailed, and this has been maintained up to tho present time. The deals wintering, though heavier than last year, should probably reach higher rates than latcly current, from the enhanced cost of manufacture, the light stock held in the United Kingdom, and the great demand for sawn lumber of all descriptions for the American markets. The stock wintering in Ottawa is very light.

	Supply.	*Export.*	*Stock.*
1882	4,611,875	3,148,688	2,507,704
1881	4,253,285	3,876,187	1,708,597

In spruce deals Messrs. Forsyth report that owing to exceptionally high waters the rivers were entirely cleared of logs, which led to a larger manufacture than in 1881. The mills have no reserve of logs and must depend entirely on this winter's manufacture. Thero has been a good demand, prices being fairly upheld, and little or no stock remaing in first hands.

	Supply.	*Export.*	*Stock.*
1882	3,239,960	2,787,309	1,012,920
1881	1,590,487	3,097,342	810,028

THE MONSTER TREES OF CALIFORNIA.

As regards the wonderful size of the Sequoia, that is a matter which does not at first fully come to one. The fact is that all the trees are so large that one fails to realize the magnitude of the giants. It requires a mental education to convince one's self that the transformation is something quite out of the common. It is only when you come to walk in and out of the hollow trees, and to circle around them and take a constitutional by walking alongside of a fallen giant, or perhaps, (if it has done duty as a chimney before it came to grief) by riding up inside the hollow for a considerable distance, that you begin to understand their size. You do so best when, standing on the ground beside a prostrate tree lying buried in a ditch of his own making, you look up at a red wall rising perhaps 15 or 20 feet above your head, bulging outward considerably and extending in a straight line for 300 feet aloug the ground, and tell yourself that it is only a tree! The owners of the beautiful grove near the hotel have erected tall ladders to enable people to climb on to some of these heights and walk along the fallen trees as if on garden terraces. It sounds cockney, but it is decidely pleasant to gain a view of the forest from an elevation of 30 feet, and it is not every one who can scale the red rampart without the aid of the ladders. If you choose to clamber along the upturned roots you may find an airy seat some 40 feet above the ground. This sounds high, but on further consideration you begin to marvel how such extraordinarily small roots can ever have formed a fit pedestal for so ponderous a weight. They have literally no depth and a comparatively small spread, so they have merely a superficial hold on the earth's surface. Yet this slight support has enabled these huge bodies to resist the wild storms of many centuries. All the big trees of the district are concentrated in two groves, namely, the little forest gem of Calaveras, and a much larger belt known as the South Park Grove, on the Stanislaus river, about six miles further. In the Calaveras grove on the Sequoias lie within an area of 50 acres, over which space about 100 lie scattered singly or in groups. Of these 20 attain a circumference of about 80 feet near the base, and one, which is distingushed as the Father of the Forest, is found to measure 110 feet around; it now lies prostrate, and has apparently done so for many a century, for the well-nigh imperishable wood is in part decayed, and long use as a chimney had burned out its inside and destroyed its summit ere it fell. The portion that still remains is like a long mountain, and two large archways have been cut into the side of the said mountain in order that those whose taste lies in that line may ride into the hollow trunk and come out by the further opening. It is estimated that the tree, when perfect, must have been about 450 feet in height. Of the trees now standing four exceed 300 feet in height, and one measures 325. About 25 are said to exceed 250. One can, perhaps, better realize what these mean by finding the amount of house-room to be obtained within a hollowed tree, Several, such as "Miner's camp," and "Pioneer's camp," have been used as temporary houses. In the latter 50 persons can find sitting room; others are used for stabling horses.—*G. F. Gordon Cumming in the Gentlemen's Magazine.*

KILN-DRIED LUMBER.

When the question of a dry-kiln or no dry-kiln comes up, the up and dressed lumberman, under certain conditions decides it in the affirmative. Often it is for the lumber manufacturer to say whether his money shall lie for months in the board piles, being all that time unable to meet the requirements of the trade, or whether he shall invest in a kiln, and thus be able to turn the cut of his mill into cash at an early day. The interest of the money locked up in several million feet of lumber while it is air seasoning, would in a short time erect a kiln; besides it is a good deal of satisfaction for a business man, who tries to be worthy of the name, to be able to fill orders promptly and satisfactorily. The oaths wafted out upon the breeze by distant dealers who are obliged to pay a great many dollars every year for transporting water, when they ought to pay for carrying lumber only, would make a huge volume if collected. With some manufacturers there is a strong opposition to kiln dried lumber, but the feeling in favor of it is growing. A year or so ago, a firm of Boston builders put up a very fine house finished with hardwoods. It was supposed that the lumber was thoroughly seasoned, but the furnace heat played havoc with the work to such an extent that the owners of the building called upon the contractors to make good their job. To do so was expensive, and they now declare that for the good of their own pockets they will hereafter use no lumber forsuch finishing that has not been properly passed through the dry-kiln. The lumbermen in the South, who are oftener than otherwise obliged to ship long distances, feel the need of kilns, aud it is safe to predict that a great many will be erected south of Mason aud Dixou's line within the next year.—*Northwestern Lumberman.*

CROSS-PILED LUMBER.

The *Northwestern Lumberman* says:—The Muskegon mill men cross piled, the latter part of the sawing season, uearly 150,000,000 feet of lumber, or a quarter as much as was cut. It was piled at the mills because the Chicago market would not take it at prices satisfactory to the manufacturers. To-day, an houest count would name 800,000,000 feet as the amount of lumber in the Chicago yards. A good winter's trade will lessen this large stock materially. With such a trade, the Chicago dealers would want the Muskegon cross piled lumber on, or soon after, the opening of navigation. The Muskegon men have said by their actions, which always speak very plainly, that they will not sell the product of their mills at the prices which ruled during the later fall months. Acting on the same principle, should lumber be no higher next spring, they will then refuse to sell. The Chicago dealers are of the opinion that the Muskegon men may not be able to run their mills for several successive seasons and cross pile the products of them, and the Muskegon men are confident that things will so shape that next spring the Chicago men will take tbe cross piled lumber at prices satisfactory to the seller, and thus make room on the docks that can be utilized whenever there may come another depression. There is more than one man in Chicago who is interested in these different phases of the question, and the same may be said of at least one man in Muskegon. Time will decide them. It is impossible to tell which way a cat will jump until the bag is untied.

VALUE OF HEMLOCK.

The *Northwestern Lumberman* says:—Hemlock, that has beeu considered the offal of the forests, is gradaully asserting its rights. In the East, where it has been used all along, it is increasing in value, builders appreciating the fact, more than ever, that in many instances it can be used in place of pine; and the cost of it is much less than pine. The hemlock timber of Michigan and Wisconsin has been looked upon as almost worthless property, but the men who own it are disabusing their minds of that idea, and are alive to the fact that not many years hence it will figure as a valuable wood. They are not so ready to give it away as they were even two years ago. There is probably hemlock enough in Michigan to supply the mills of the Northwest with their yearly stock of logs for five years, and in due time every tree that will produce merchantable lumber will be wanted. Long before the exhaustion of pine it will be learned that hemlock has been unjustly despised, and when the end of the pine shall be near at hand hemlock lumber will sandwich in admirably.

Tapping the Timber.

A railroad company has recently been organized in Wisconsin to construct the Wisconsin, Pittsfield & Superior railroad from Remington to Dexterville, in Wood county. It is understood that the road is to be built in the interest of the Chicago, Milwaukee & St. Paul road, to form a part of that system when completed. The line will at present extend no farther than the northern part of Wood county, notwithstanding its Superior name. The main purpose of the line is to tap a section covered with valuable timber.

Rough Siege Laid to Him.

Mr. James O. Neville, the well kuown General Import and Export Agent of the "Allen Line," and General Dominion Shipping Agent, of 538 Dorchester street, Montreal, is an active member of the Shamrock La Crosse Club. "While on a late exhibition trip to the States," said Mr. Neville to the writer "my old foe, the rheumatism, attacked me, and gave me a rough siege. I suffered with the ailment all though my trip and long after my return home. I tried several remedies and found them entirely useless. Having read the indorsements of well known people who had used St. Jacobs Oil, and been cured thereby, I determined to give it a trial. Upon the first application, I saw at once it was what I required. In two weeks time I was as well as ever, and fully able to attend to my business. I have not had the least suggestion of rheumatism since. It certainly is a remarkable remedy and one that seems to me to be infallible."

A CURE FOR CROUP.—There is no better remedy for Croup than Hagyard's Yellow Oil taken internally and applied according to special directions, this is the great household panacea for Rheumatism, Stiff Joints, Pain, Inflammation, &c.

W. T. BRAY, Pharmacists, Wingham, Ont., writes that the sale of Burdock Blood Bitters have very largely increased in that locality, and adds that he hears very favorable opinions expressed regarding it, and if time permitted could send many names of benefitted parties.d,

Chips.

NEARLY 1,000 men are at work in the Adirondack wilderness this winter in the employ of two firms.

ANGUS & BUCK have nearly completed a chemical pulp mill, at Angus, Que., 16 miles from Sherbrooke on St. Francis river.

THE Duluth Lumber Company has begun the erection of a large dry-kiln. It will cost $18,000, and have a capacity of drying 50,000 feet of lumber a day.

AN immense amount of cedar shingles will be cut this winter in Aroostook, Me., if present prices hold. Cedar swamps are good property in that countynow.

A citizen of Kaukauna, Wis., in digging a well, found embedded in the hard clay, 24 inches deep, several pine cones, in as perfect shape as if direct from the tree.

THE electric light system at Utsalady, W. T., which is employed at the mills for vessels loading, makes day of the darkest night, and can be seen from the heights nine miles distant.

AN unusually large number of big sticks were latterly brought over the Olympia & Tenino railroad, W. T., which ran from 100 to 104 feet in length, and measured from 3,000 to 5,000 feet. The road takes regularly about 800,000 feet monthly to tide water from a single camp.

FLETCHER BROTHERS, of Minn., have purchased of W. C. Sargent considerable cedar stumpage on the south shore, near Duluth, and will erect a mill, and establish offices and yards at Squaw Bay. There is reported an increase of activity in the cedar business in the Duluth district.

THE *Timber Trades Journal* says:—The falling away of the Baltic log trade is said to have been very marked this year. A great deal of pond space, formerly employed for the storing away of Baltic logs, is reported to be now vacant. The tendency of the trade of to-day is certainly in the direction of sawn in preference to hewn wood.

THE carpenters of the Northern Pacific railroad are building woodsheds in Idaho in order to have sufficient dry wood for the locomotives. The shed at Sand Point is 200 feet long by 75 feet wide and those at Camp Hope, Cabinet, Gravel Pitt 3, Rock Island, Trout and Beaver creeks are 20 to 120 feet. The wood to fill these sheds is already cut.

THE Northwestern Lumber Company at Hayward, in this county, is putting in the machinery at its new mill, which will comprise two gangs, two circulars, two trimmers, detachable haulup chain, log rollers, and other approved appointments. It is calculated that the mill will saw 200,000 feet daily, and the company proposes to bank 40,000,000 feet of logs this winter.—*Ashland Press.*

THE *Northwestern Lumberman* says:—The manufacturer who will grumble at the profits of this year's business would certainly complain if he were going to he hung with a silken rope. There has little stood in the way of money-making by the saw mill man. If he has not made his business pay, it was because he either conducted it very loosely, or thought that about all the standing pine was gone, and paid more for his stock than he ought to.

THE *Northwestern Lumberman* says:—Figures representing the cut of 1882, so far as collected, show that the aggregate for the season will be much larger than ever before. There has been no serious hindrence in any district, except at Muskegon, Mich., where the strike put operations back to quite an extent. In the Saginaw and northwestern districts the work of turning out lumber went on smoothly, there heing no disturbance among the employes, and no damage from high water.

IT is stated that it is not at all improbable that the Michigan Central Railroad Company will huild a railroad from the Mackinaw division to Thunder hay. An engineer of the company has been making preliminary surveys from Beaver lake and Piper, extending into Oscoda county, and is now making a survey from Alpena to connect with the Mackinaw division at Beaver lake, *via* Piper. These lines would open up a wide section of timber country to railroad communication.

LATER estimates place the amount of lumber burned in the fire that destroyed the Saginaw barrel works at 1,700,000 feet, a considerable portion of which was hardwood.

ADVICES from Maine lumhermen go to show that operations this season in that state fully equal those of last winter. Though, owing to the hurning of the mills at Fairfield, 10,000,000 feet of logs are left over, there will be no shrinkage in the coming log crop below that of last season. Lawrence, Philips & Co., at the Somerset mills, have about a year's stock on hand for their mills there, and will cut 7,000,000 feet of logs. The total log crop of the operators at Fairchild will not fall much short of 40,000,000 feet.

THE lumber interests of Nashville, Tenn., during the last decade have increased about five hundred per cent. In 1870 there were but three saw mills and six planing mills. Now there are within the consolidated limits of the city, 13 saw mills, 12 planing mills and 33 firms engaged in the lumher trade. Previous to the civil war the amount of lumber handled in this city did not exceed 5,000,000 feet annually. Last year the city mills cut 50,000,000 feet of walnut, ash, poplar and pine, much of the finer grades of which was shipped to the north and west and exported to European markets; while there was received by river and rail not less than 35,000,000 feet additional.

Consumption Cured.

An old physician, retired from active practice having had placed in his hands by an East Indiana Missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for General Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it is his duty to make it known to his fellows. The recipe, with full particulars, directions for preparation and use, and all necessary advice and instructions for successful treatment at your own home, will he received by you by return mail, free of charge, by addressing with stamp or stamped self addressed envelope to

DR. J. C. RAYMOND,
164 Washington Street, Brooklyn, N. Y.

KEEP it in your family. The best remedy for accidents and emergencies, for Burns, Scalds, Bruises, Soreness, Sore Throat, Croup, Rheumatism, Chilhlains, and Pain or Soreness of all kinds, is that marvellous healing remedy, Hagyard's Yellow Oil.

Market Reports.

TORONTO.

From Our Own Correspondent.

DEC. 22.—The steady spell of wintry weather combined with the near approach of the holiday season has had the effect of bringing building to a stop, and a state of quietude reigns at all the retail yards, and but few cars of lumber are coming in on any of the railroads, and as there is but little to record in connection with the trade at the present time it may not be unwise to give you a few figures anent the season's sales and shipments at this place, which may, I think, be relied upon as being as nearly accurate as it is possible to get at it. Having taken the trouble to call at the different yards throughout the city and having been kindly assisted by each of the dealers in arriving at correct estimates, I am thus enabled to give correct figures, as to the past years business, and I venture to say that the showing is quite a respectable one more especially as regards the city's consumption.

We have exported during the year as follows :

AMERICAN MARKETS.

Lumber	52,000,000 feet
Shingles	14,000,000 "
Lath	2,000,000 pieces

TO CANADIAN PORTS.

Lumber	6,000,000 feet
Shingles	1,000,000 "
Lath	500,000 pieces

SOLD BY RETAILERS DURINO THE YEAR.

Lumber	45,000,000 feet
Shingles	11,500,000 "
Lath	16,500,000 pieces

SOLD DIRECT TO CONSUMERS BY WHOLESALE MEN.

Lumber	27,000,000 feet
Shingles	4,000,000 "
Lath	7,000,000 pieces

And to the above may be added as shipped by car load by middlemen to points east and west, principally the latter :—

Lumber	3,000,000 feet
Shingles	1,000,000 "
Lath	500,000 pieces

Thus making a total handled here this season of :—

Lumber	133,000,000 feet
Shingles	31,500,000 "
Lath	20,000,000 pieces

This would represent a money value of something like 2¼ millions of dollars and then it must be borne in mind that fully one third more lumber than above represented has been handled by Toronto wholesale dealers and shipped direct from the mills to the west and also to Winnipeg ; and another favorable feature of the past season's trade by retailers, is, there have been less bad debts.

MONTREAL.

From Our Own Correspondent.

DEC. 25.—Trade in lumber is pretty slow just now and entirely confined to the supply of retail wants, which have been small but considered fair for the season. Dealers are busy stock taking to see what the result of last years operations proves to be. Laths are still in demand at the high price, and other quotations are firm and unchanged. There is nothing as yet worth reporting from the woods ; there has been plenty of snow which should enable the lumbermen to get out a large quantity of logs. The manufacturers of hardwood in the townships are hard at work and no doubt the supply will be ample next season. We quote prices in the yards as under :—

Pine, 1st quality, ℔ M	$35 00@40 00
Pine, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00
Pine, 4th quality deals, ℔ M	11 00@12 00
Pine, mill culls, ℔ M	10 00@12 00
Spruce, ℔ M	10 00@13 00
Hemlock, ℔ M	9 00@10 00
Ash, run of log culls out, ℔ M	20 00@25 00
Bass, " " ℔ M	17 00@20 00

LIVERPOOL MARKETS.

The latest mail advices report the consumptive demand for western goods as being fairly satisfactory with a further decline in spruce deals. Several cargoes of St. John, N. B., spruce deals were placed at £8 to £7 15s, by private sale, and by auction an average of £7 16s. 7d. was obtained. Wholesale quotations are for Quebec square white pine 1s. 7d. to 2s. 5d. per cubic foot ; Quebec waney board pine 2s. 3d. to 2s. 8d. per cubic foot ; 1st quality Quebec pine £21 to £22 per standard ; 2nd quality Quebec pine £15 to £16 per standard ; 3rd quality Quebec pine £9 10s. to £10 per standard ; St. John, N. B., spruce £7 15s. per standard.

CORDWOOD.

Prices are unchanged and there has been a pretty fair demand for maple which is reported as going out well during the past week. Imports are still meagre and until the country roads are a little better for heavy loads not much is looked for. We quote ex cartage at the depot :—

Long Maple	$7 50
Short "	7 00
Long Birch	7 00
Short "	6 50
Long Beech	6 50
Short "	6 00
Long Tamarack	6 50
Short "	5 00

OSWEGO, N. Y.

From Our Own Correspondent.

We send you corrected quotations to date. Trade has been very dull for past four weeks ; stocks are about as large as usual ; the assortment is good ; dealers are expecting a brisk trade after the New Year's festivities are over. Laths are scarce, the stock of shingles is very much in excess and prices are very weak at our quotations. The receipts at this port for the two past seasons have been for 1882 213,000,000 feet, for 1881 169,000,000 feet.

CHICAGO.

The *Northwestern Lumberman* of Dec. 21, says :—A December quietude brooks over the lumber trade of the entire country. The year is drawing to a close, and lumber dealers are getting ready to underscore a twelve-months' operations.

Last year the December spot supply of about 600,000,000 was not considered excessive by the wisest dealers here, and their opinion was borne out by the after results. The February and March sales reduced the yard stocks so low in assortment that the spring opened with hardly enough to supply the rather sluggish trade that followed in April and May. Circumstances may possibly produce a like condition next spring, though that is hardly to be expected, since the markets everywhere are better supplied than they were last year at the season's close. Hence, while it must be admitted that the surplus this year is greater than it was last, and the prospects of trade are yet in doubt, the excess of supply need not necessarily mean a heavy decline of prices in the spring. The condition of weather and roads, and the prices of farm products, will, more than the amount of stock on hand, determine the demand for lumber during the nine coming months, as well as the prices that will prevail.

Receipts, and stock on hand, of lumber, shingles, etc., for the week ending Dec., 21, as reported by the Lumberman's Exchange :

BOSTON.

Cotton Wool and Iron of Dec. 23, says :—General trade is seasonable quiet. The protracted cold weather has in the main put an end to nearly all outside and new operations for the season. The toue of the market is quiet and steady, with a moderate amount of new business offering iu a conservative way. Advices from the country are quite favorable to logging operations so far, although it is yet too early to safely predict the final outcome of the season's work.

BRISTOL.

THE *Timber Trades Journal* of Dec. 9, says :—Messrs. King Brothers' December circular says :—There has been but a poor demand for timber of all descriptions during the past month, and the only noticeable feature is a falling off in the importation, reducing the excess of this year's tonnage over last very materially. Quebec goods.—The importation of all classes of these goods has been extremely limited, owing to the great difficulty in obtaining ship-room. Yellow pine timber—There have been inquiries for both common and wany board timber. Birch, ash and elm, with the exception of the former, have been selling freely. There has been no arrival of walnut. Deals do not attract much attention, except those of extra dimensions. Staves are in fair request. New Brunswick goods.—Spruce deals—There does not appear to be any demand at present for these goods. Prices are unchanged. Stocks are not excessive. Pine deals—No arrivals. Birch is quiet. Memel, Dantzic, &c., goods.—Fir timber—There has been an inquiry for this article, but stocks appear exhausted. Wainscot logs have sold somewhat freely at fair prices. Oak logs—We do not hear of any transactions. Staves are in but limited request.

The arrivals for the past month consists of 3 vessels from Quebec, 2,722 tons ; 2 from Nova Scotia, 825 tons, and 2 from Finland, 604 tons ; together, 7 vessels, 4,151 tons register ; against 18 vessels, 10,090 tons register, for the corresponding month last year, showing a decrease of 5,939 tons register. For the season commencing February 1st, 1882, to the present time, there have arrived 149 vessels, 73,561 tons register, against 115 vessels, 64,700 tons register, for the same period last year, showing au increase of 8,852 tons register.

GLASGOW.

The *Timber Trades Journal* of Dec. 9, says : There has been only a trifling addition of American woods to the stocks in Clyde ports during last week, and the little after this date which may drop in will not affect the general market. On the whole there is a fair supply on hand of the various descriptions. Of birch timber there have been no fall cargoes of lower port wood, and the market is open for such. At present there is a good demand for American walnut, teak, and mahogany, and very fair prices are obtained.

Prices fluctuate in Glasgow as well as elsewhere, but that they are so good at this time of year and under circumstances less favorable to trade than they have been must be very reassuring to those who are apprehensive that the stocks of foreign timber are too heavy in this country to justify the expectation that prices can be kept at their present currency. If European prices give way, it is thought those of British America must come down also, but when we see Quebec 1st quality pine fetching £10 to £12 per standard more than the choicest Archangel deals, it is evident that for certain purposes of panelling, and other joinery, there is no competition between American and European pine. The former will be had if the buyer has to pay 50 per cent. more for it.

LIVERPOOL.

The *Timber Trades Journal* Dec. 9, says:—The diminution of busiuess which usually makes itself felt as the end of the year approaches has begun to manifest itself, and although there has been a fair amount of timber, deals, &c., taken from the market recently, yet the decrease as compared with that of last month is large in the aggregate, but compared with that of last year there is no great difference, as it amounts only to about 37,000 cubic feet. A comparisou of the figures in the following stock list will shew the position held by the various items at this period last year and the present time.

Spruce deals have come forward faster then was required, aud as cargoes continue to be stored on accouut of the shippers, the stock has accumulated, but has not yet reached the quautity held last year at this time. At the same time, as cargoes have in some cases been forced from the quay, prices have given way. The import of flooring has also been slightly beyond the demand, and the stock on hand is now sufficient for the winter months.

LONDON.

The *Timber Trades Journal* of Dec. 9, says : There is but little doing in the timber trade just now, that is, in the buying and selling departments outside of the saleroom. If you talk to a f. o. b. seller about next season's prices, he is ready to discuss probabilities with you,

but, unless you are prepared to make him an offer, he is rather shy of quoting a price. He can give you abundance of reasons why the markets ought to be firm, and thinks importers are very wrong to let their goods go so cheap when, if only they would stand out for a good profit, they would be sure to get it. Turn to a buyer, and you find yourself very little the wiser afterwards. He is in no hurry, and is going to wait and see which way the cat jumps before he enters into new engagements. He tells you it is difficult to do any good by importing at the prices demanded on the other side, and he thinks they must come down rather considerably to induce extensive business; and looking at the stocks in Northern Europe, and the plentiful supply on this side, it seems to him that they want more customers in this country than they are likely to find for some time to come. If you suggest that the continent of Southern Europe will come to the rescue, as great works are being undertaken in France and the Low Countries, and that even Spain is greatly increasing her transactions with Sweden, he tells you that he has heard that argument many times before, but that there was always plenty left for this country, which generally came forward quite as fast as it was wanted, and frequently much faster.

THE BLOW-OFF.

One of the most important parts of a steam boiler is the blow-off. It is also one that is subject to more abuse in its construction, location, and use than almost any other fixture pertaining to the boiler. The most peculiar ideas seem to prevail in regard to its construction and position on the boiler. Some put it at the front end, some at the back end, and some put it in the middle of the shell. The great majority also, instead of putting it on the bottom of the shell, where it belongs, insert it through the heads of the boiler, anywhere from two to six inches above the bottom of the shell, thus rendering it impossible to entirely empty the boiler when desired, and greatly impairing its efficiency for any purpose.

The only place for a blow-off pipe to enter a horizontal externally-fired boiler is through the bottom of the shell within a foot or so of the back head. The boiler should be set slightly lower at the back end than at the front, say three-fourths of an inch for a boiler fifteen feet long. Then it may be entirely emptied by simply opening the blow-off valve, and all syphoning of water out through hand holes is obviated.

This, however, is not the most important reason for locating the blow-off at the back end of the boiler. In a horizontal externally-fired boiler the application of the heat, and the resulting circulation of the water, is such that the sediment is always deposited at the back end to a much greater extent than in any other part of the boiler. Obviously, then, this is the place for the blow-off. It is true that most boiler makers now place it there, but there are many who still persist in placing it at the front end.

The proper method of constructing and attaching the blow-off pipe to the ordinary horizontal boiler is as follows: First, the pipe should be two inches in diameter. A circular piece of boiler plate about eight inches in diameter should be riveted on the bottom of the shell, with its center not over twelve inches from the back head. The hole for the pipe had better not be made until after this piece is riveted on, and then it should be drilled. If, however, facilities are not available for doing the job in this way, it may be drilled before it is put on. The hole should then be tapped, when it is ready for the pipe. The rivet holes on the inside of the shell should always be countersunk, and the heads of the rivets driven flush with the inner surface of the plate. If this is done there are no projecting rivet heads to assist in the collection of sediment at this point. A blow-off attached in this manner and provided with a straight away valve outside the setting will always give perfect satisfaction if properly cared for. In many cases, however, where the water is bad, they are not opened often enough, and the inevitable consequence is that they soon become filled up with scale and sediment. When this occurs it may always be regarded as the best possible proof that it is located in just the right place, and, if properly attended to, will prove most effective in keeping the boiler free from scale and sediment.—*The Locomotive.*

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and Account Books of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

Books taken out in parts, Bibles, Works of Art, Illustrated Works, Music Books, Magazines, Perodicals and Newspapers bound in any style desired.

Old Books, Albums, &c. Repaired and Rebound.

LONDON STOCKS.

THE *Timber Trades Journal* of Dec. 9, says: The dock deliveries continue to improve, but they are only "forging slowly ahead" of those of the same date last year. There is a clear gain of about 120 standards this week, at which rate of recovery it would take more than two years to bring them parallel with the deliveries of 1881 from the same docks. These indices of trade seem inconsistent not only with the access of importation as signified by the Board of Trade returns, but also with the reputed activity of the building trade in and about London. But facts put into figures are hard things to get ever.

If there were a short supply in the docks the puzzle would disappear, hut it happens that of the most marketable goods there is an unusually good supply. In Baltic deals and battens there are still about 1,300,000 pieces more than last year at the end of November, of British American there are fewer, both in pine and spruce, but the difference is not above 150,000, or about one-eight part of the excess from European ports. In flooring and boards generally there are now only about 500,000 pieces more than last year, a mere bagatelle, when we recall that earlier in the year the difference was counted in millions. There was, however, at this period in 1881 a much larger quantity landed, but not taken into stock, than there is now, and the next dock returns will probably show a nearer approach to equality in the two seasons.

PUGET SOUND LUMBERING.

TACOMA, W. T., Dec. 15.—The winters operations on the Sound will be much heavier than on any previous season, it being universally conceded that next year's demand will be greater than on any previous year of the lumber industry on the Sound, aud prices will likely rule as high as in 1882. The local demand, already very large, will no doubt increase 25 per cent. There is now great activity among the loggers New roads are being cut, new camps established, land secured, etc. A general movement toward back lands is observed, the margined lands having been cleared of their best timber. As a result considerable railroad building will follow during the coming year. The fact of this enforced retreat into the heart of the great forests, the necessary construction of logging roads, the purchase of heavy tracts of timber. and generally increased expense, makes it apparent that larger capital will henceforth be needed in the same ratio that operations are extended. There are already several large concerns operating on the Sound, but the time is not far distant when the interests of this region will equal those of the great North, and receive the attention of such representative men and concerns as Tom Nester, the American Lumber Company, the Diamond Match Company, and the like Where, 10 years ago, 15 men constituted a big camp force, 30 to '60 are now frequently employed.—*Northwestern Lumberman.*

STOCKS AT LIVERPOOL.

The *Timber Trades Journal* says:—Judging from the quantity of timber, deals, and other wood goods lying at the various wharves and railway depots for shipment to the country, there would appear to be a good consumption going on, and when the statistics for the month are made up it is not at all improbable that the figures will be found to be larger than is at present thought. Although the import of spruce has been much beyond the anticipations of those most interested, comparatively little has gone into stock, although in some cases importers have stored their cargoes rather than yield to any further concessions in prices, as the late sales have been made on terms which must have left shippers with heavy losses to face, as buyers recently have had all the best of the market. Reports from the shipping districts all point to a curtailment of supplies from those ports which are in no danger of being frozen up, but, on the other hand, there will doubtless be an amount of anxiety to press forward goods from the northern ports whilst the opportunity affords, rather than have them wintering over.

Lumberman's Farm.

Wells, Stone & Co., who lumber in Roscommon, Gladwin and Clare counties, Mich., have a fine farm of 1,000 acres in Gladwin county, of which 600 acres were under cultivation during the past season. The crop comprised 500 bushels of wheat, 4,000 bushels of oats, 250 tons of hay, 1,900 bushels of potatoes, 5,500 heads of cabbage, 19 barrels of pickles, 3,000 bushels of turnips, 300 bushels of onions, 200 bushels of beets, and other things usually grown on a farm. All this stuff is used in the firm's camps.—*Northwestern Lumberman.*

Tenons.

A single tenon is, theoretically, stronger than a double one, and its mortise also weakens the timber in which it is framed less than 2 mortises would. Practically a double tenon would be used with a joint bolt for drawing the framing together, placed between the two tenons; or it might be advisable to use two tenons to diminish the effect of shrinkage, as, for instance, in a door, where a double tenon often answers better than a single one.

THE Toronto *Canadian Manufacturer* says:—At a meeting of representatives of insurance companies, held on the 3th Dec., an advance was made on rates for insuring lumber in any part of Ontario and Quebec, the cities of Montreal, Toronto, and London only excepted.

IN common with the general cry, the preparations for logging on the Wisconsin river are the greatest ever known, 140,000,000 feet of logs being already contracted for, to be put into the main river and its tributaries, north of Merrill, while at least 40,000,000 feet more, not under contract or to go on the market, may be calculated on.

THE Emerson *International* says:—Carney & Watson are having loaded at the station ten car-loads of lumber destined for Regina, where it will compose part of a large stock of lumber and building material in a new lumber yard to be opened at that place by Messrs. G. F. Baldwin and L. R. Schaffner of this place. Mr. Baldwin expects to leave for Regina next week.

GLASS FOR BUILDING.

The Chicago *Northwestern Lumberman* says:—

"The *Lumberman* is rather proud that it was the first to name glass as a building material. It saw in the future—and not in the far future either—buildings the sides of which were constructed of glass instead of brick, stone or wood. Some of its contemporaries were inclined to make light of the idea; but the man who leads the way is sometimes reviled. A remarkable instance of the kind occurred a great many years ago. A representative of one of the leading dailies of Chicago has been interviewing the architects of the city, and among the reports is the following:

'A prominent firm of architects, who have the reputation of holding conservative views, are inclined to think that in the near future glass is to enter much more extensively into building material than ever before. The firm states that, owing to improvements in manufacture, glass can be manufactured in blocks, columns, capitals, friezes, etc., of any size and of any design which the most diverse tastes can conceive of, and that it is capable of sustaining a greater weight than any other substance, even granite, which is composed largely of quartz crystals. Annealed glass columns, for instance, could be introduced for entrances, supports, etc., without very much expense over and above unannealed glass, the process requiring only extra care and more time in cooling. It is very possible to build entirely of glass blocks. The material is smooth, clean, and handsomer than any other, and will not intercept the sun's rays, so that it would give a saving in fuel, and, being impervious to atmospheric changes, would be practically everlasting. It would require no laths, plaster, or paint, and would not retain impurities from the atmosphere, which would seem to make it desirable from a sanitary point of view. It could be made in any color, could be transparent, clouded, or opaque, and moulded into any desired shape.'

These opinions coincide exactly with what the *Lumberman* has said on the subject, and it congratulates the architects, although they are a little late, that they are on the right track. The following table will be of interest as showing the average crushing weight per square foot of the different building material now in use, also of glass, one of the coming materials. It will be seen that glass will bear three times the weight of granite:

	TONS.
Glass	1,800
Granite	600
Basalt	700
Building sandstone	300
Red sandstone (New York and New Jersey)	250
Brick	175
Ordinary brickwork	25
Good brickwork laid in cement	35
Brickwork, first-rate	60
Slate	600
Concrete (1 part lime and three parts gravel)	30 to 50

THE STINGING TREES OF AUSTRALIA.

The stinging plants of Queensland, Australia, belong to the natural order Urticaceæ, and represent two genera, *Urtica* and *Laportea*. Of the first named genus there are two species in Queensland, both herbaceous plants:

1. *Urtica incisa*, found chiefly on the Fitzroy River, and said by M. Thozet, of Rockhampton, to grow in great profusion.

2. *Urtica urens*, a common weed in this country—the nettle—and found in the neighborhood of dwellings in Queensland.

In the genus *Laportea*, on the other hand, there are three great stinging trees:

1. *Laportea gigas*, a large tree, often attaining a height of 100 feet or more. The wood is soft, fibrous, and juicy, and the bark smooth and ash colored. The base of the tree is supported by prominent angles or buttresses. The leaves are from 1 foot to 1 foot six inches long, and nearly as broad, smooth above and sprinkled with a few stinging hairs, but more or less covered with short, soft hairs underneath. It is found chiefly in South Queensland. The sting is severe, but not so bad as that of *L. moroides*.

2. *Laportea photiniphylla*.—A fine tree, from 60 to 70 feet in height, with a straight stem. The wood is soft, and the leaves are almost elliptical in shape, nearly smooth and sprinkled with a few stinging hairs. It is found in the Moreton Bay district, and also in North Queensland. M. Thozet mentions having found it on the Fitzroy River.

Laportea moroides.—A small tree, with most virulent stinging hairs. The leaves which are about 9 inches long, are covered with short soft hairs on both sides. The fruit is of a beautiful purple color, succulent, and densely clustered. This tree is found chiefly in the Kennedy district in North Queensland. Mr. Fitzalan, of Bowen, mentions that it is common about Port Denison and Edgecumbe Bay.

These stinging trees, which Bentham and Von Mueller place in the genus *Laportea*, are by many botanists included under *Urtica*.

Of all the stinging plants of Queensland, *Laportea moroides* surpasses the others, both in the severity of the pain produced at the time and in the duration of its effect.

Woods for Pulp.

Wood pulp, which is made into paper, and molded into barrels, casks, pails and other woodware, boxes, cornices, picture frames and a variety of small articles, can now be made from many other woods than poplar, which has long held the preference in such manufacture. Buckeye has a white fiber, and can be used, while spruce, pine, chestnut, basswood, fir, hemlock, cedar, cottonwood and other kinds of wood have been found suitable for making into various kinds of paper. Only the non-resinous woods are adaptably for white paper, while the resinous woods serve well for colored paper. Machines have been built which turn out pulp with equal facilities from all kinds of wood, different stones being required for different woods however. The longest fiber is made from willow basswood and poplar ranking next respectively, in that regard. Cedar, fir and hemlock are said to grind about alike, the latter working a little more freely. Maple has a fiber shorter than that of either spruce or pine, and is quite hard to grind. Birch is comparatively hard, and grinds very short. Poplar and buckeye pulp remain white for a considerable time; other woods changing color. Birch becoming pink, maple turns purple and basswood takes on a reddish hue. It is estimated that over 200 tons of wood pulp are daily turned out in the United States.—*Northwestern Lumberman.*

Work in the Woods.

In their operations on the Trent, Moira Salmon and Napanee Rivers and their tributaries, Rathbun & Son employ in the vicinity of 900 men. The season thus far has been very favorable for lumbering operations, as the weather has been very pleasant and the snow fall sufficient to enable hauling to be done quiet readily. Already the firm has 150,000 pieces of pine cut and skidded, in addition to ceder ties, pickets, and telegraph posts. At first it was the intention to make the cut for this winter as extensive as possible, but the chances are, judging from present indications, that the work in the woods will, to a certain extent, be curtailed, as the prominent lumbermen of the district, after consultation, have decided to limit their production for next year. Rathbun & Son have gone into the tie trade very extensively. They have a contract to supply the G.T.R. between Montreal and Sarnia; they are expected to fill all the wants of the Quebec & Ontario Railway, with the exception of the portion between Peterborough and the Trent River; they supply the Midland, and have contracts for furnishing three roads in New York State with these rail supporting requirements. The firm's business this winter, will therefore, be quite extensive.—*Belleville Intelligencer.*

A SURE THING.—In the treatment of Chronic Disease with that great system renovator and restorative, Burdock Blood Bitter, there is no uncertainty as to its action, its curative powers are speedily manifested by its marked effect upon the Liver, the Bowels and the Kidneys. Every dose performing its work in a perceptible manner.

A WISE MAXIM.—"A stitch in times saves nine," not only in making garments, but also in mending health. If Hagyard's Pectoral Balsam were used in the earlier stages of Colds and Coughs, many a "stich in the side," and many a case of torn lungs might be avoided, that, neglectad, rapidly develope into irreparable Consumption,

FIRE IN THE WOODS—DON'T START ONE.

A friend of ours once had a startling experience in a clearing on the southern shore of Lake Superior. Sitting on a large log, twenty feet long, he thoughtlessly held the lighted end of a cigar upon the half rotten surface, and went away without noticing the effect. The next day at the same hour, passing by the spot, he was astonished to find the huge trunk nearly consumed, and all glowing with an intense heat. The fire had silently eaten its way through and through the log, and nothing but its chance isolation prevented a disastrous forest fire, which might have laid waste half a dozen counties and destroyed a thousand homes.

Everyone who goes into the woods—every hunter, chopper, logger, picnic party, rambler, botanist, should bear in mind that a spark may cause a conflagration, as ruinous as that which occured in Michigan last year.

The forests of the United States still yield annually four hundred and fifty million dollars' worth of merchandise, and furnish employment to one million persons. This is the least of their usefulness to us. They prevent the too rapid evaporation of the rain; they retard the melting of the snow, thus preventing destructive floods, garnering up the water for safe and gradual use, and keeping the mountain springs ever full and fresh. Let us unite in guarding this precious inheritance.—*N. Y. Ledger.*

The Digestibility of Oysters.

Why oysters should be eaten raw is explained by Dr. William Roberts in his lecture "Digestion." He says that the general practice of eating the oysters raw is evidence that the popular judgment upon matters of diet is usually trustworthy. The fawn colored mass, which is the delicious portion of the fish, is it liver, and is simply a mass of glycogen. Associated with the glycogen, but withheld from actual contact with it during life, is its appropate digestive ferment—the heptive diastase. The mere crushing of the oyster between the teeth brings these two bodies together, and the glycogen is at once digested without any other help than the diastase. The raw, or merely warmed, oyster is self-digestive. But the advantage of this provision is wholly lost by cooking; for the heat immediately destroys the associated ferment, and a cooked oyster has to be digested, like any other food, by the eater's own digestive powers.

"My dear sir, do you want to ruin your digestion?" asked Professor Houghton of Trinity College one day of a friend who had ordered brandy and water with his oysters in a Dublin restaurant.

Then he sent for a glass of brandy and a glass of Guinness's XX, and put an oyster in each. In a very short time there lay in the bottom of the glass of brandy a tough, leathery substance resembling the finger of a kid glove, while in the porter there was hardley a trace of the oyster to be found.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. Norisk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

Vick's Floral Guide.

For 1883 is an Elegant Book of 150 Pages, 3 Colored Plates of Flowers and Vegetables, and more than 1000 Illustrations of the choicest Flowers, Plants and Vegetables, and Direction for growing. It is handsome enough for the Centre Table or a Holiday Present. Send on your name and Post Office address, with 10 cents, and I will send you a copy, postage paid. This is not a quarter of its cost. It is printed in both English and German. If you afterwards order seeds deduct the 10 cents.

Vick's Seeds are the Best in the World? The FLORAL GUIDE will tell how to get and grow them.

Vick's Flower and Vegetable Garden! 175 Pages, 6 Colored Plates, 500 Engravings. For 50 cents in paper covers; $1.00 in elegant cloth. In German or English.

Vick's Illustrated Monthly Magazine—32 Pages, a Colored Plate in every number and many fine Engravings. Price $1.25 a year: Five Copies for $5.00. Specimen Numbers sent for 10 cents; 3 trial copies for 25 cents.

CONSUMPTION
POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no bumhug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,
20l24 **360 Fulton Street, Brooklyn, N. Y.**

EARS FOR THE MILLION

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.

This Oil is abstracted from peculiar species of small **White Shark**, caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous**, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!

It has performed a miracle in my case.
I have no uneartbly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

The Way They Do It.

A correspondent of the Grank Fork *Plaindealer* attempts to elucidate the method pursued by the alleged pine rings of Minnesota to squeeze out rival bidders at an auction sale of standing pine:

"The only way to bid safely at a pine land sale is to procure estimates, which will cost $10 and upwards per 40 acres. When the day of sale arrives—which may or may not be put off from time to time if too many bidders are on hand (this has been done in the past before)—the bidding commences. This ring, that is in possession of estimates covering all the land to be offered, appoints one or more men to bid for it. This ring may, and probably will, embrace capital to the extent of $5,000,000. If no opposition is made the land is bid off at from $1.25 to $2 per acre; but if opposed by a bidder the lands are run up and unloaded on the outsider at a high price, or they are bid out of his reach. Thus one of his estimates is disposed of; and so on until his list is exhausted. As soon as bidders are out of the way the price drops to $1.25 or $2, the latter being the highest price the government has ever secured at former sales. After the sale is closed the excess paid to drive off outsiders is divided *pro rata* over all the lands purchased by the ring. Under this system the individual is contending against amassed capital, with the usual result."

The Men for the Woods.

The *Northwestern Lumberman* says:—Every man does not stop to think how the lumber industry would be crippled if immigration to our country were to stop. If loggers and saw mill operators were to hang out the sign, "No foreigners need apply," all instead of few of the families who settle in the new West would be obliged to live in dug-outs. American boys can keep books, go to college, and live off the old man, but not many of them are inclined to pile lumber or endure the rigor of camp life. It would be a sight worth witnessing to see them lay off their silk suspenders and swing the axe or pull the cross-cut. They look upon the foreigners in flannel shirts and big boots who seek the jobbers as very ordinary cattle; but these same foreign gentlemen are prepared without special training to go into the woods and make themselves useful to the world. Their muscle is equal to the task of swinging a four-pound axe from daylight to dark, and it is fortunate that a swear in a foreign tongue makes the mule as lively as though it were hurled at him in the purest English.

A California Tree.

There was recently felled in Sonoma County, California, a tree which cut up as follows. The Petaluma *Argus* says that the details can be relied upon. The standing height of the tree was 347 feet, and its diameter near the ground 14 feet. In falling, the top was broken off 200 feet distant from the stump, and up to the point of breaking the tree was perfectly sound. From the tree saw-logs were cut of the following lengths and diameters: 1st, 14 feet long, 9 feet diameter; 2d, 12 feet long, 8 feet diameter; 3d, 12 feet long, 7 feet 7 inches diameter; 4th, 14 feet long, 7 feet 7 inches diameter; 5th, 16 feet long, 7 feet diameter; 6th, 16 feet long, 7 feet 10 inches diameter; 7th, 16 feet long, 6 feet 6 inches diameter; 8th, 16 feet long, 6 feet 4 inches diameter; 9th, 16 feet long, 6 feet 3 inches diameter; 10th, 18 feet long, 6 feet diameter; 11th, 12 feet long, 5 feet 10 inches diameter; 22th, 18 feet long, 5 feet 6 inches diameter. It will thus be seen that 180 feet of this remarkable tree was converted into saw-logs.

JAMES VICK.—From the appearance of *Vick's Floral Guide*, which is on our desk, we should judge that the young *Vicks* are "chips of the old block," as the *Floral Guide* with its lithographed cover is handsome enough for the parlor table. It is printed on the best of paper, has three colored plates of Flowers and Vegetables, and full of useful information. Those who send 10 cents for it cannot be disappointed, as the plates alone are worth the amount. Address, as in past years, JAMES VICK, Rochester, N. Y.

VEGETABLE
PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

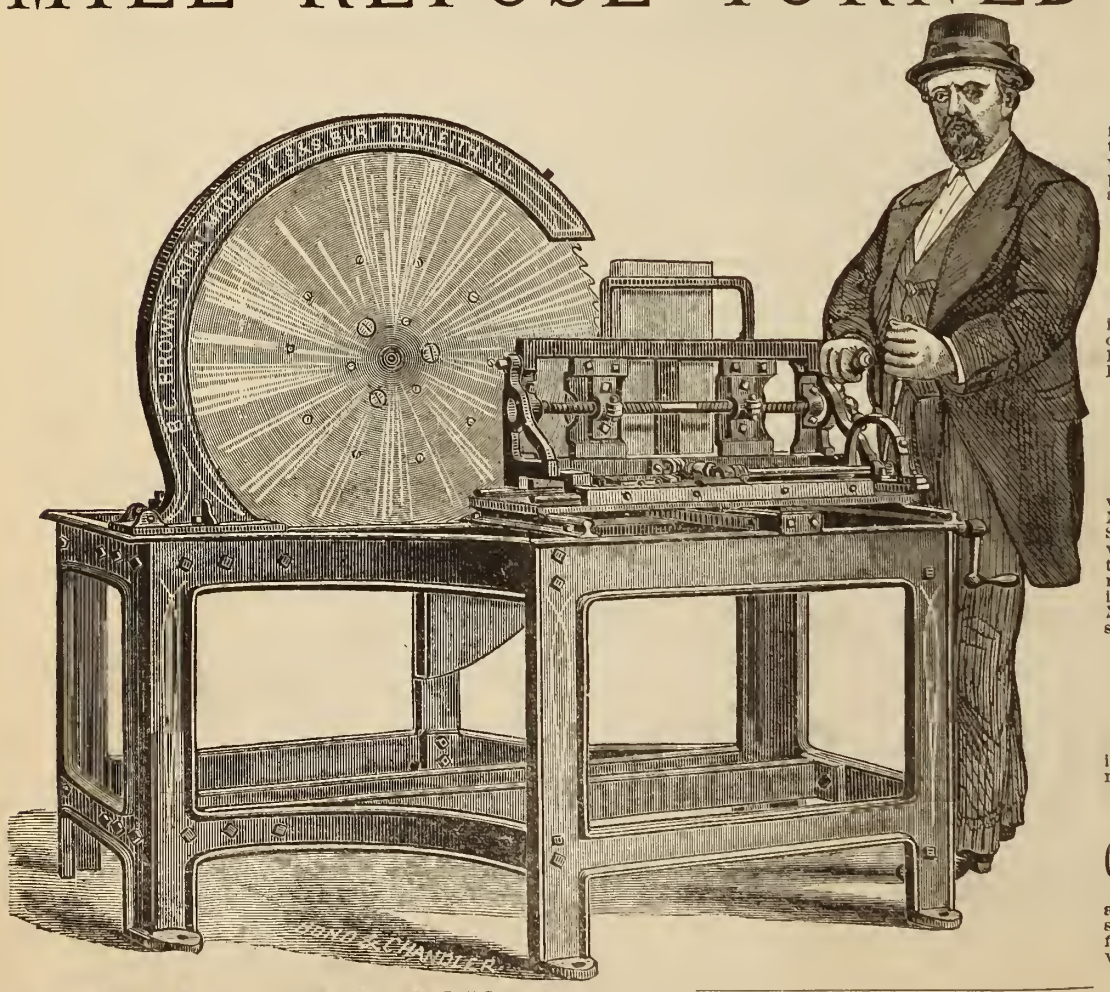
MILL REFUSE TURNED INTO MONEY



BY THE USE OF

Brown's Patent Spalt and Shingle Mill,

for making Shingles, Barrel Heading, Box Stuff, &c., from spalts, board trimmings, slabs, and mill waste generally, turning material otherwise worthless into valuable products. I have made arrangements with the patentee to manufacture and sell for the Dominion; have made and sold a good number of these machines which are giving excellent satisfaction and can give the best of references.

Our Steam Feed for Circular Mills,

is now the Best Feed where Steam is the motive power. It is easily operated, is simple, rapid, and seems never likely to wear out; sixteen 16 ft. boards, or eighteen 13 ft. boards, have been cut by it in one minute. It is the established feed for steam mills; I make a specialty of its manufacture; will guarantee satisfaction.

Our Patent Twin or Span Circular,

with Steam Feed for Steam Mills, and Rope or Rack Feed for Water Mills is fast coming into general estimation and is used in place of Gang Slabber in our best Canadian Mills. One of our Span Circulars which will slab logs 25 inches in diameter down to 7 and 8 inch stocks, will do the work of three slabbers, with an immense reduction in first cost, running expenses and labour. Two of these machines can be seen at work in Messrs. Gilmour & Co's Mill, Trenton, and Georgian Bay Lumber Co's Mill, Waubaushene and Port Severn. ☞I am also introducing a new style of Mill Engine, neat, substantial and simple, with Corliss Frame and Balanced Valve, all carefully designed and honestly made.

Covel's Automatic Saw Sharpener,

is now well-known and highly appreciated, when placed at work in the mill it sings out its own praise; I keep it constantly on hand, ready for immediate shipment.

Our Standard Circular & Gang Mills & Machinery,

are too well known to need any reference, any further than to say that I spare no pains or expense to have my work all first-class and give satisfaction, and as I make Heavy Saw Mill Machinery a specialty, any party wanting a First-class Mill will find it to their advantage to give me a call.

VOL. 3. PETERBOROUGH, ONT., JANUARY 15, 1883. NO. 2.

PROSPECTS IN SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* says :—Work has now commenced in the woods in some places, while the process of forming gangs in others is in progress. Heavy masses of snow have fallen before the ground and morassses were properly frozen, artificial means will have to be used in many cases before "driving" can be resorted to. There is at present every disposition to restrict the "get" of logs to a moderate quantity ; and this will probably be the advice given to members at the forthcoming meeting of the society of saw mill owners and timber exporters, to be held here on December 16th. It is hard to say whether this advice will be followed or not ; but, if not, there is every probability of further price falls, as it is quite evident that production is getting ahead of consumption.

The returns of exports from Sweden for the ten months ending 31st of October of this and last year's totals are as follows for our trade :—

	1882.	*1881.*
	Stds.	*Stds.*
Sawn and planed wood.....	675,730	542,170
	Cub. ft.	*Cub. ft.*
Square and partially square wood	15,393,212	12,643,486

showing an increase equal to about 25 per cent. in the sawn and planed wood, and of over 20 per cent. in the hewn wood. The significance of the above figures, in conjunction with a reduction in the deliveries from London docks of over 13,000 standards during a similar period, ought to do more than anything else towards keeping the log "get" down during the present winter.

A RUSSIAN ENTERPRISE.

A correspondent sends us the following interesting account of a large saw mill estate in Russia, to the management of which he has recently been appointed :—

Gorval is a large old estate, which formerly belonged to a Polish family, but was sold last year to a Russian General. The place is very large, between 40 to 50,000 deschettims, or, to give you a better idea of its extent, I may tell you that if I wished to take a ride round its limits, I would have to prepare for a ride of about 120 English miles. It is situated about 1,000 versts, or about 650 English miles, south of St. Petersburg, where the two rivers, Berezina and Dneiper, meet.

The woods on this estate are very extensive and valuable, consisting mostly of red fir, but also oak, elm, ash, &c. The fir which is growing here is of a first-rate quality, growing most beautifully, 80 to 100 feet high, straight as candles, and of a size rare in the more northern parts of Europe. The climate is mild ; a rather short, but frequently very cold winter, and the summer very warm. Grapes ripen on the estate. The ground is free from undulations, and hardly a stone to be found on it, which will enable us easily to get out of the woods our 150,000 blocks which we are going to cut this winter, the evenness of the ground allowing us to cart the blocks on wheels as well as on sledges.

We are building this winter a saw-mill with six frames, and next spring a planing and moulding mill, and also joinery works. A speciality will be oak parquetry, which is very much used here in Russia, and has a market almost to any extent.

All the newest machinery in use for wood-cutting and woodworking are already partly ordered, and will be taken advantage of for this enterprise. The saw-mill, as well as the factory, will be lighted up with the electric light. The motive power, both for the mill and for the joinery works, are going to be three English steam engines of 40, 40, and 50 horse-powers respectively, and five boilers of together 150 horse-power. Next summer a tramway of 10 to 15 English miles is going to be built into the woods, in order to make it easier to get the blocks out. More than 2,500,000 blocks are calculated to be growing on the estate.

What makes this business of special interest is that, as far as I know, there are neither saw-mills nor joinery works worth mentioning in this part of Russia. The next year's production is calculated to be 7,500 standards, a part of which will be sold in Russia ; the most of it will have to be exported, *via* Libau.

Most things are very different here to what they are further north, and so is also the way of getting the timber out of the woods. In the North it is generally left in the hands of the foreman to find horses for carting the wood down to the rivers, and much depends upon them whether the blocks come out and what price.

In this part of Russia, which formerly was Polish, the peasants were up to the year of 1862, as it was called here, Kriepostnoje, or a sort of slave. Living in small communities or villages, they had nothing they could call their own, Everything belonged to the community, and the community itself belonged to the owner of the estate on the ground of which the community was situated. Since 1862 a new era for these poor peasants began. Each became possessed of a very small piece of land, which he could cultivate, and call it his own, and at the same time he became the proprietor of the poor hovel in which he was living. This certainly made a great difference to each individual. The community, however, remained very much the same as it had been for hundreds of years. In these little villages they live still that patriarchal sort of life they had always been used to. The eldest man is the head of the family and the elected eldest is the head of the community. Before his tribunal every case is brought, be it of dispute or be it of general importance to the community. and settled in an assembly where every one has a right to a seat, without any trouble of being elected.

If I have any work to be done which requires the help of many men, I do not want to make up an agreement with each party separately. I make up a contract with the whole community, in which each individnal pledges himself to do a certain amount of work ; and when such contracts have been signed by the whole community, I can, without risk, advance any amount wanting to the parties in question.

This is what we have been doing here. A mass of contracts have been made out with all these little villages in the neighborhood, the one village pledging itself to give a certain amount of hands to dig, another so many hands to do carpenter's work, another for masonry work, another for transport of bricks, another for the building of flood vessels, and a great many for felling of the trees in the woods and for transport of the logs to the river.

The winter came early this year ; we have had frost and snow for some time and the works in the woods have already begun. We wait only for more snow to come to see such work going on, as certainly this place never dreamt of before.—*Timber Trades Journal.*

RAILWAY SLEEPERS IN FRANCE.

A recent number of the *Revue des Eaux et Forets* contains the following abstract of a long-delayed report on the above subject by M. Jacquin, Ingenieur en Chef des Ponts et Chaussees :—

In 1877 the six great French railway companies required 2,563,000 sleepers annually for the maintenance of their permanent way. Compared with the mileage, this amounted to 93 sleepers per kilometre (0·6 English mile) per annum, or to over 7,000 sleepers daily.

Assuming a single tree to supply on an average 10 sleepers (which is below the average of beeches, but above that of oaks), the maintenance of the French railway system necessitates the destruction of 700 large trees for every day in the year. When the projected extensions have been carried out the expenditure will amount to 1,000 large trees daily. To this enormous figure must be added the quantity required for repairs of rolling stock, which cannot be put down at less than 140,000 cubic metres (about 5,000,000 cubic feet) in the year. Besides this, the construction of 20,000 kilometres of new lines, as proposed, within the next ten or fifteen years, will cause a further demand for 20,000,000 new sleepers.

With a view to the reduction of this enormous demand, the French railway companies have long been endeavouring, like others, to increase the durability of their sleepers by impregnating them with antiseptic substances, the two heretofore most used being cupric sulphate and creosote.

On the South (*Midi*) and West (*Ouest*) of France lines sleepers and telegraph poles impregnated with both these substances have long been in use and are still in a perfect state of preservation. A creosoted beechen sleeper was taken up on the West of France line after nineteen years' service. This is a remarkable example; but similar instances may be met with on other lines ; the real mean average life of such impregnated sleepers does not, however, appear to have been as yet satisfactorily determined.

After long experience, the Eastern of France line (*de l'Est*) gives the preference to gas-tar over all other antiseptics, and creosotes even oaken sleepers, the sapwood as well as the less indurated portions of the heart absorbing the tar freely. The sleepers are not put in creosoting chambers, but are cut and dressed so that all the bearing surfaces are thoroughly impregnated. Under a pressure of 6 to 7 atmospheres, oaken sleepers absorb 7 to 8 kilogs, of creosote, beechen sleepers 30 to 35 kilogs. There is reason to hope that the larger quantities thus absorbed increase the power of resisting the elements of destruction in a corresponding degree.

Mr. Blyth has proposed a process of treating log or sawn wood with hydro-carburetted gas in close chambers, that is to say, exposing it to the action of ordinary high-pressure steam, containing liquid hydrocarbons in a state of spheroidal diffusion. The inventor claims for the process that it effects perfect saturation of every part of the wood, whether green or dry, sawn or unsawn, with the protective substance. These promises, somewhat over-sanguine perhaps, have not yet had the full confirmation of experience.

The solution of the railway sleeper problem has been sought in another way. Stone, concrete, and cemented brickwork sleepers have come up again. But it must be remembered that these offer neither the conditions of elasticity nor the facilities for attachment which are indispensable, so that there is no prospect of their general adoption. These metal sleepers have been tried, and, could a good model be found, our great metallurgical firms would, no doubt, find a new element of industry in supplying the imperious demands of the iron horse. But, unfortunately, the experiments made thus far, on different lines, have not given satisfactory results. A metal sleeper, to be successful, must combine all the qualifications of resistance to a transverse strain, a good seat on the ballast, and stability in the mode of attachment of the superincumbent rails, and withal the outlay must remain the same. This is the point generally overlooked by inventors. It is not enough to have a perfect line on the opening day, it must be kept in working order, and to do this, so far as French experience goes, a larger outlay appears to be necessary with metal sleepers than with wooden ones. The results at present are therefore unfavourable to the use of metal sleepers.

CANADIAN HARDWOODS.

Our trade in hardwoods, which a generation ago was confined, as far as Ontario is concerned, almost exclusively to walnut and oak, has undergone of recent years a remarkable development. Uses have been found for woods whose adaptability and beauty were not known or recognized in former times. And a value is now plaeed upon a number of these which not long since were regarded as fit for nothing but fuel. Basswood for example, was considered, at the time when the Reciprocity Treaty with the States was in force, as fit only for cordwood—poor cordwood at that; black ash was almost equally despised; soft elm was neglected; and hickory, that strong, tough timber, so much used for carriage wheels, was regarded as desirable only for snow-jumpers, or for winter fires.

An unforeseen demand having arisen for many kinds of timber within the last few years, both abroad and at home, it may be well to notice the great variety of hardwoods Canada possesses, their *habitat* and uses. The classification adopted by a firm of Toronto dealers, prepared for the Ontario Government and communicated to the *Northwestern Lumberman*, may serve us. It is as follows:

Ash.	Elm.
Basswood.	Hickory.
Beech.	Maple.
Birch.	Oak.
Butternut.	Sycamore.
Cherry.	Walnut.
Chestnut.	Whitewood.

Of course, there are several varieties of a number of these woods. The various sorts of oak, elm and ash, for example, differ widely in their uses and values, as we shall see further on. The kinds of hardwood lumber most in request for home use or for export, we are told, are walnut, cherry, butternut, chestnut, white oak, whitewood, basswood, white ash, black ash, and soft elm. The supply of some of these is so limited, and the demand for them so steady, that they must become scarce and dear in a very few years; and, unless care be taken to replant they must become extinct; in which case the more common kinds, such as birch, maple, black ash, soft elm, will naturally be sought to take their places. A considerable share of the Canadian hardwoods now used for decorative purposes, goes to the United States. We send thither, principally from Ontario, butternut, cherry, white ash, and birdeye maple, to be used in car fittings, or house-interiors; sycamore for tobacco boxes; butternut for cigar boxes. From New Brunswick we send birch timber to Great Britain, and in that country, as well as among our American neighbors, the birch appears to enjoy increasing favor. Oak, too, we continue to ship to Great Britain in the log and in staves.

If we consider each variety in its order, we shall see what woods are most nearly exhausted, and which ones are of the the greatest value to the country.

MAPLE.—The maple, as becomes the tree whose leaf is the natural emblem of Canada, is the most plentiful of all our forest trees. In Ontario it is especially abundant. The Muskoka country, the Midland district, the western peninsula, are all well supplied. It is used for furniture and in various other manufactures, common chairs especially, and the demand is growing all the time.

BIRCH —This is a fine-grained, handsome wood, in growing estimation, and probably increasing value. There are those who think that, as an ornamental wood, it will supplement walnut, cherry and butternut. It is found generally distributed over Ontario and the eastern provinces, and care should be taken to preserve it. There is a market in the United States today for quantities of black birch, which resembles cherry, and, when stained, resembles walnut; it takes as good a polish as cherry and can hardly be distingished from that wood. There is plenty of it on the Mattawa and in the Nipissing territory.

ASH.—White ash, which is found chiefly in the western part of this province, is in active request from railway carworks, wagon-makers' shops, and agricultural implement factories. It commands good prices, if sound timber, and is largely exported to the United States. The supply is not abundant, and inroads are being rapidly made upon it. Black ash is more generally distributed; it is used for house-fittings and for furniture. The demand is increasing, but can be met by the supply.

OAK.—Of this tree we have several varieties; the white, the red, the gray and blue. White oak is most sought after, and commands the highest prices. Most of our cut of this, from all the provinces east of the lakes, goes in the log or in staves to Great Britain. Western Ontario has in past years furnished many a stately tree, and there still remains a good deal of this kind of wood. Red oak, as well as the kinds called grey and blue, are found in the north and west of Ontario. It is used generally and extensively, for agricultural implements and for railway carriages.

ELM.—Least plentiful of the many varieties of this wood is the genuine rock elm, which is in great request, from its strength and toughness, for carriage and wagon-making. It is mostly found in the neighborhood of Lake Erie or Lake Huron. Other kinds, such as the gray, blue and soft elms, are plentiful enough, and are made use of for furniture to a large degree. Soft elm is used extensively for making band hoops for flour barrels and staves, and is exported largely to the United States and Great Britain.

BASSWOOD.—This wood is common in most parts of Ontario and Quebec. Once rejected for all purposes but fuel, it is now in request by carriage and street-car makers, and for furniture and interior fitting of dwellings, &c. It is a fine-grained and delicate-colored wood, and finds a ready market in the States, as well as here. From the absence of resin, basswood is preferable to pine for panelling, &c. It *can* be used for mouldings in interior wood-work. Large trees of it have become scarce, and the small timber is now being used.

HICKORY.—The westernmost counties of Ontario were at one time very freely supplied with the hickory tree, whose nuts are so toothsome, and whose wood gives such intense heat in the old-fashioned wood stove, to say nothing of the uses of its bark to the Indian or the *habitan* for torches, by which to spear fish at night. Hubs, spokes, shafts, single-trees, and other portions of a wagon or carriage are now made from it, and agricultural implement makers understand well its properties of strength and toughness. It is now comparatively scarce, quantities of its product having been shipped to Britain from St. Thomas, Amherstburg, St. Catharines, and other points at which there are bending factories.

WALNUT.—The warm color and rich surface of black walnut when finished, have long made it a favorite wood, at first for furniture, but now for the interior structure of public buildings and private dwellings. In the wood-work of organs, sewing machines, and the like, it is regarded as indispensable, and the result of the demand is that but little walnut is left in Canada. It is now a more costly wood than ever, large trees of it being especially valuable. We have to import it from the Northwestern States; and even there, such is the demand, it is growing scarce.

WHITEWOOD.—The western peninsula of Ontario once boasted a good deal of this rather attractive wood, which has been much demanded for furniture makiug and panelling of cars, &c. It brings good prices, and is no longer plentiful.

BUTTERNUT.—For pulpit and altar decoration, for bed-room furniture and dining-room wainscot, for cigar boxes and sundry other purposes, butternut has come to be regarded as very desirable; indeed the limited supply of it, existing mainly in the north and west of this proviuce, must soon be exhausted.

SYCAMORE.—This wood is growing scarce and dear. It is principally used for tobacco boxes, for which purpose quantities have for years beeu shipped from Essex and other couutics to Americau lake ports, and even as far as Virginia. Kentucky parties have, we understand, placed saw mills at Essex Centre for cutting sycamore.

CHERRY.—A favorite and handsome wood, susceptible of a high finish, and making very rich furniture, or interior fittings for offices, &c. Ontario has but a limited supply remaining, and for this there are plenty of customers. Cherry has always been deemed a choice wood, and to-day has more admirers than ever. In two or three years, Canadian cherry must, at the present rate of consumption, become extinct, and then birch will come into vogue.

CHESTNUT.—In the fitting of hotels or offices, and in some interior fitting of churches, this wood is used, but only sparingly, because the tree is a large grained one. It will have to be resorted to as the butternut, which it resembles, becomes exhausted.

BEECH.—Not many uses have been found for beech, which remains one of our cheap and common hardwoods, to be had nearly everywhere. Tool-makers have use for it to make planes and tool-handles.

BALM.—A species of whitewood. It is used in place of basswood and real whitewood. It is called by some of the Americans cottonwood; but deemed superior to the wood growing along the Mississippi and State of Ohio. It also takes the place of inferior quality of pine. The counties of Kent and Essex produce it largely. It is used for stave and heading bolts, and a large quantity is sawed into lumber and shipped to the United States, where it is used in wagon shops, agricultural works and so forth. There is still a large quantity remaining, but it is being used up fast, as the demand for it is great, and good prices are obtained.—*Monetary Times.*

PROTECTION OF THE FORESTS FROM FIRE.

The following letter appears in the Toronto *Mail*:—

SIR,—From time to time articles and letters have appeared in the *Mail* and other papers lamenting the destruction of our forests by fire, and advocating measures for its prevention.

The Legislature now in session should pass some measure whereby the provisions of the Hon. T. B. Pardee's Firo Act could be practically enforced. As it now is, as far as preventing fires the Act is a dead letter. Its 14th clause provides that it shall be the special duty of every Crown land agent and bushranger to enforce this Act, and to prosecute every person guilty of a breach of its provisions and requirements; but as these men have no instructions or authority from their department to that effect, they can do nothing. And as for lumbermen taking up and prosecuting parties guilty of breaches of the Fire Act, it is simply absurd, as they would do it at the risk of having more of their limits purposely burned another year.

It would appear that some of the greatest fires have occurred since the passing of the Act, and this may be due to the fact that no person is afraid of being prosecuted under its provisions.

Most people are under the impression that it is only the license-holder who suffers from fires set out in the limits. They forget that every timber forest destroyed by fire represents so much revenue lost to the province, let alone the actual loss to the license-holder.

There is another great loss to be considered, and that is the loss to the country of the money which would be paid out in manufacturing and bringing this timber to market had it remained green.

During the summer of 1881 fires overran large parts of the Parry Sound and Muskoka districts and the country lying between the Georgian Bay and the Ottawa river, and according to an estimate made in the *Globe* of November 10th, destroyed $10,000,000 worth of pine in Ontario. This does not nearly cover all the fires, as there were many fires on licensed lands of which the public knew nothing, the holders of the limits burned keeping the knowledge of it to themselves, not wishing the value of their properties to be depreciated.

If these annual fires continue, in a few years they will make a large hole in the revenue of Ontario.

There was three-quarters of a million dollars in bouus alone obtained from the last sale of timber berths, and the duty on the timber growing on them will represent to Ontario, if not burnt, upwards of five million dollars, and perhaps more. As these berths are now being operated on, or likely to be within a few years, and owned by so many different parties, the risk of fires is much increased. Before the sale, these births were in their virgin state, and not much exposed to fires, being held by the Government, but now that operations have commenced on them, they will stand a poor chance.

There should be a distinction made by the Crown Lands Department between pine lands and hardwood lands fit for settlement. It is well known that in the back districts of Ontario and the Ottawa Valley the pine lands are generally not fit for settlement, and that where settlement has been made on them the settlers, instead of prospering, yearly grow poorer and poorer, till in many places they were actually driven from their holdings by starvation, as witness the Opeongo road, the Bouchere and Mississippi counties, which are now nearly deserts, nothing but dry pines to be seen as far the eye can reach, while on the other hand, those who settled on the hardwood lands have done well and made themselves comfortable.

Now that the country is mostly all surveyed, and the quality of the lands known to the Government, through the reports of its surveyors and bushrangers, it surely would be easy to make a distinction between lands for settlement and those for lumbering. A large portion of Opeongo and Bouchere country was not surveyed until after its settlement, and the Government had not therefore the knowledge they now have about their unoccupied lands.

It surely would not be to much to expect that the source of such a large revenue to this province as its timber forests should be better guarded against loss than it now is.

If the present staff of woodrangers was increased, and kept in the woods during the months of May, June, July, and August, to watch the Crown domain against fires, with authority to enforce the provisions of the Hon. Mr. Pardee's Fire Act, they would prevent many bush fires being set out. They should also be empowered to call on farmers, river-drivers, surveyors, and others who may have set out fires, to turn out and assist in killing them and preventing their spread. If one-fifth of the revenue which would have been derived from the timber destroyed by fire in 1881 alone had been expended in watching the Crown domain, it would have paid the salary of a large staff of men for several years, and it is more than probable that not much damage from fires would have occurred.

If persons holding and working limits, and their agents and foremen, were all held responsible for the damage done by the fires set out by them or their men, and also the heads of surveying or huuting and fishing parties, they would be more careful than they now are.

Practical bushmen say that it is not so hard as some would suppose to trace the makers of fires in the woods as it is to trace incendiaries in cities, and that almost all fires can be traced to their starting points, and generally the parties who set them out.

Yours, &c.,
Jan. 4, 1883. LUMBERMAN.

A QUESTION OF PROTECTION.

The discussion of tariff revision in the United States has brought up the question of the conservation and protection of the forests. Under the existing tariff a protective duty of one dollar per thousand feet is imposed on hemlock, basswood, whitewood and sycamore lumber imported into the United States, and of two dollars per one thousand feet on all other kinds of lumber. The report of the Tariff Commission recommends a reduction to seventy-five cents in in the former rate, but, inasmuch as the woods to which this reduction would apply, viz.: hemlock, basswood, whitewood and sycamore, are either found in large quantity only in the United States, or are little employed in the manufacture of lumber, the reduction proposed will cause no substantial diminution of protection to the lumber interest. What the freetraders desire is the abolition of the duty on all other woods, and more especially of that upon pine and spruce lumber, which are largely imported from Canada. The ground upon which this abolition is urged, if well taken, makes it questionable whether the effect of the removal of the duty will be altogether advantageous to Canada. It is that, with the duty removed, American manufactures will purchase a much larger por-

tion of their lumber in Canada and so check the exhaustion of the home supply that under the present circumstances is rapidly proceeding. The New York *Post* in directing attention to the subject thus states the case :—"Our forests are rapidly swept away by the drains now made upon them. They must be relieved, and their only possible relief is found in Canada. The $22,000,000 which the tariff takes from the pockets of consumers of lumber is unimportant in comparison with the indirect damage this tariff causes to the country by hastening the destruction of the forests. We must look this matter clearly in the face ; we must not deliberately allow our forests to be destroyed, and entail upon ourselves and our children all the evils which their destruction will bring, merely to make a few lumbermen rich. On this one point tariff reformers and protectionists can well meet on the common ground of public necessity. The future prosperity of the country is at stake." Taking the view that the conservation of our forests is of greater moment than their conversion into money, with the sources of employment which such conversion affords, it would be the course of prudence on our part to impose an export duty on all lumber sent out of the country. That is a proposition to which, however, scanty support would be accorded. We watch with concern the measure of our lumber exported, we trace in the expansion and contraction of that trade the measure of our commercial prosperity, we encourage in many ways the extension of lumbering operations, we are even eager to induce the United States to open its markets to the products of our forests free of duty, in order that we may more rapidly turn the fixed weath of our forests into floating capital. It seems somewhat curious to find an influential journal in the United States urging the abolition of the duty on lumber, less because it conceives that consumers will thereby gain an advantage in lower prices, than because the American forests ought to be preserved by the sacrifice of those of Canada. Our own conviction is that the abolition of the American duty on lumber imported from Canada would check in an unappreciable degree the destruction of timber wealth of the United States. With American markets adjacent to Canada, but remote from the centres of the home supply, such as those of New York State, freedom of import would cause an enlargement of trade, but when it is stated that the import of Canadian pine and spruce lumber into the United States is only one-twentieth of the total quantity annually manufactured in that country, it will be seen how remotely the question of the preservation of the forests is affected by the duty. The importance of conserving of forest wealth is yearly becoming more generally recognized ; it is being continually pressed upon the Governments of Canada and the United States by the press, and by the Forestry Congress, whose labors in this direction have been arduous and laudable. But it is a subject beyond the influence of tariffs ; it is one which each country must deal with directly through legislation tending to prevent the wanton destruction and waste of the forests now prevalent, and tending to the encouraging of tree-planting. If due care is exercised in this direction by our governments, the abolition of the American duty will be a matter of congratulation to us, as contributing to the enlargement of trade with the United States, without causing a counterbalancing loss in the rapid exhaustion of our lumber supply.—*Montreal Gazette.*

THE FOREST RESOURCES OF MEXICO.

The New Orleans *Times-Democrat*, in reviewing an article from *La Patria*, Mexican journal, gives the following concerning Mexican forests : Hitherto the vast pine, cedar, walnut and oak forests that are scattered so plentifully along the slopes of the Sierra Nevada and the Sierra Madre mountains, and on the sides of the mountainous ranges of tall foot hills that corrugate the surface of the country, have never been utilized. The ports on either coast and the cities of the interior connected with said ports by wagon roads were, and yet are, supplied by the saw mills of the Atlantic, Gulf and Pacific coasts. But the mere cost of transportation to the Mexican seaports, and from thence to the cities of the interior, renders the price of foreign lumber very high. For example, Orizaba, which is about 90 miles by railroad from Vera Cruz, consumes a fair quantity of lumber annually, yet sapless pine wood sells readily, at the railroad depot of Orizaba, for $75 per thousand feet. At Chihuahua, the capital city of the state of the same name, which is distant about 100 miles from one of the grandest pine forest regions on the planet, fine pitch-pine lumber often brings as high as $80.

It is a well known fact that the Mexican Central, the Mexican National and the Mexican Oriental Railroad companies have been compelled to purchase the vast quantities of timber consumed in their construction works, in the United States. Our southern mills have hitherto controlled this great traffic, but the time has at last arrived when Mexicans begin to appreciate the value of this business, and are making arrangements to secure by Government grant or otherwise, most of the timbor lands of the Republic.

Notwithstanding the fact that the greater portion of Mexico lies within the tropics, such is the peculiarity of its topography that most of the several states may be said to enjoy all varieties of climate, comprising the different grades from tropic heat to extreme cold.

Where the land attains an altitude of 4,000 or 5,000 feet above the sea, pine, oak, larch, sycamore, walnut, hickory and hard cedar trees flourish to perfection. The states of Sonora, Chihuahua, Coahuila, Durango, Sinaloa, Michoacan, Jalisco, Mexico, Hidalgo and Vera Cruz, possess an almost inexhaustible quantity of these valuable timber trees, as well as forests of mahogany, cedar, ebony, etc., which are produced in the lands lying in a lower altitude.

In view of these facts, and in consequence of the rapid development of the country by American railroad enterprise, the general government —where it possesses timber lamds—and also the state governments, have determined to grant liberal concessions to all capitalists who may desire to undertake the development of the vast lumber resources of Mexico.

The time is fast approaching when our southern timber dealers will appreciate the immense value of the forests of Mexico. This enterprise should be taken in hand by southerners. Mexico, for hundreds of miles, is divided from our southwestern territory by only a narrow, unnavigable river ; and while American lumbermen can supply the American market with Mexican lumber, produced on Mexican soil, they might at the same time furnish our southern timber mart with the precious woods, so sought after by the furniture makers of this section.—*Northwestern Lumberman.*

THE U. S. LUMBER DUTIES.

The New York *Sun* has the following article : The intelligent discussion which the action of the Committee of Ways and Means in recommending the retention of the duty upon lumber entering the United States has excited in all parts of the country, is gratifying, It indicates that purely economic questions are growing in popular favor, and that everything relating to our forests or forest protection interests the people.

It is probably this interest in forest protection, rather than the desire for cheaper lumber for the consumer, which underlies this discussion.

It is the height of folly, of course, to tax foreign lumber. The duties collected in this way by the Government are insignificant in amount, and every dollar thus collected is taken, over and over again from the consumer of domestic lumber for the sole benefit of the manufacturers. These have not the excuse of a weak and undeveloped industry which must be built up at the expense of the consumer for the general good of the country.

The manufacturers of lumber are rich, prosperous, and strong. Their methods and facilities for carrying on their business are unsurpassed. No possible competition can deprive them of large profits. If there exists in the United States a single industry which is in the position to flourish without protection, it is the lumber industry.

From purely economic grounds this duty should be removed. It has served to build up dangerous monopolies, and it represses the prosperity of the country. It is evident, however, that the wide interest manifested in this question arises less from the feeling that it is desirable to prevent monopoly than from the fact that the removal of this duty is the first, and an indispensable, step toward forest protection. The forest question is becoming one of the popular questions of the day, and everything which relates to the extent and condition of our forests is eagerly read and discussed. It requires no great knowledge of the subject to understand that if Canadian lumber is excluded by the tariff, the drain upon our forests must be greater than if Canadian lumber was allowed to compete on equal terms with the product of our own forests. The people understand this ; they understand that the destruction of the forests means something more serious than a dearth of lumber. They apprehend that the removal of the forests will be followed be severe climatic changes ; that the rivers of the country will often be changed to torrents or reduced to streamlets ; that springs and streams will disappear ; that agriculture will perish and manufactures languish. They see these evils hastened by the retention of this protective duty ; they ask themselves by what right the prosperity of the country is placed in jeopardy because it is the pleasure of a group of men to grow rich, and because Congress is too ignorant or too indifferent to stop this abuse. No more vital question can come before Congress ; perhaps no Congress has ever been called on to decide an economic question of greater moment.

Is there no man who can join the discordant elements of the Protectionists, the Tariff Reformers, and the Free Traders ; who can unite Democrats and Republicans on the broad platform of public necessity, to check this destruction of our wasting forests? Such a man will deserve the name of statesman and the gratitude of the country.

Log Slide.

THE *Northwestern Lumberman* says :—Parmelee & Son, Malone, N. Y., are logging on the slope of a precipitous mountaiu, near Lake Titus, Adirondack region. To get the logs down the mountain they have constructed a slide one-third of a mile long. It is said that the momentum of cannon ball is hardly equal to that with which the spruce sticks are hurled from the lower end of the slide. The *Courier and Freeman*, of Potsdam, in view of this device for denuding the mountain sides, gloomily exclaims : "This, and other similar items, shows that in a few years the Adirondack wilderness will be changed into a treeless scene of desolation. Its lakes, ponds and streams will dry up ; but so long as money is to be got the havoc will go on."

Devoted to Forest.

Mr. M. C. Read, of Hudson, Ohio, says :—In the Dominion of Canada are millions of acres of land which from the nature of the soil must be perpetually devoted to forest growth. They constitute the natural sources of a supply of lumber for the productive arable and pasture lands to the south of them, in the United States, as well as in Canada.

The time is at hand when we shall be wholly dependent upon this source of supply, or upon the artificial growth of timber in our own country, if the present rate of destruction of our forests is continued.

LITTLE BY LITTLE.—The constant dropping of water will wear away even the hardest stone. So the constant irritation of a cough will so wear upon the lungs as to induce incurable Consumption. Hagyard's Pectoral Balsam will cure the worst cough, speedily and effectually.

GOOD ADVICE.—If our readers will accept proffered advice, they will always keep a bottle of Hagyard's Yellow Oil at hand for use in emergencies, such as Burns, Scalds, Wounds, Lameness, Croup, Chilblains, Rheumatism and all varieties of aches, pains and inflammations. It will ever be found reliable.

MR. THOMAS W. RACE, Editor and Proprietor of the Mitchell *Recorder*, writes that he had a prejudice against Patent Medicines, but being induced to try Burdock Blood Bitters, for Billiousness that occasioned such violent headache and distress as to often disable him from work. The medicine gave him relief, and he now speaks of it in the most favorable terms.

CONSUMPTION

POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,

20L24 **360 Fulton Street, Brooklyn, N. Y.**

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

CALIFORNIA CEDAR.

The incense cedar (*Libocedrus decurrens*) is one of the valued trees of the California coast and mountains. It is eminently noted for great rapidity of growth, wonderful lightness, stiffness, and extraordinary durability. A thousand uses have sprung up and are multiplying around this interesting cedar as its most inestimable qualities become better known. Fortunately it is one of the most extensively distributed trees of the Pacific—found from the coast range north, south to San Diego, Sierra Nevada, southern Oregon, and most of the interior mountain region from 2,000 to 4,000 feet, and it even thrives quite well at 6,600 feet altitude, but seeming to give out at 7,000 feet, though said to extend to 8,500 feet, which is questionable. As usual with the sylva, flora, and fauna, this also is found lowest along the coast, where it finds the requisite temperature and other essentials, with combined moisture. The base or lower trunk somewhat resembles the Western juniper (*J. occidentalis*). It is to be noted in general that trees of such broad, outwardly sweeping, or expanded bases seldom blow over, and to the perceptive and artistic eye their significant character is one of firmness and stability. One hundred to two hundred feet high, six to nine feet in diameter (rarely larger) the shaft is often clear of limbs 80 to 100 feet, and although the lower limbs or even dry branches, may encumber the middle portion, pin-knots do not damage the timber. The massive body tapers more rapidly above than redwood, and is less eccentric than juniper, yet its general port resembles most the best specimens of the latter. The light cinnamon bark is thick and of shreddy-fibered texture, but so concretely compacted as to render the surface evenly ridged by very long, big bars of bark. These sweep obliquely down on the long spiral twist of swift water lines. The top is conic, the foliage is in compressed, flattened sprays, upright, thickened, and somewhat succulent; if not a languid type, at least in no sense rigid. It bears some resemblance to the great western arborvitæ (*Thuja gigantea*), but the tiny leaf-scales are opposite and quite awl-pointed. The general hue of the foliage is light yellowish green, warmly tinted, golden and bead tipped, with tiny, oblong male catkins, as the fruit ripens in October and November. The cones are pendulous from the tips of twigs, oblong, and seldom over three-quarters of an inch long, little more than one-third as thick, and for the most part slightly compressed. The wood is a pale cream tint in color—a delicate salmon shade. This would hardly warrant the name white cedar, sometimes applied to it, as well as the giant arborvitæ. The extreme lightness of the lumber and its sweetness for packing boxes will commend it for express and commercial purposes, for posts and fencing, and especially railway ties, for sleepers, stringers, and ground timbers of all varieties, and for unnumbered uses, a tithe of which cannot be told in a brief notice. Formerly these trees were cut away and burned up to clear the track for redwood, tamarac, and ponderous pith-pines, etc.; now all else is superseded by this incense cedar. Thus is seen how hasty and ill-advised notions give place to genuine merit.

A fungus *(dædalus)* attacks and honeycombs it; and riddled as it may occasionally be, still, if spike or nail finds substance enough to hold, or sufficient solidity to resist crushing, then, for many purposes, even such lumber is practically as good as the soundest timber; because when the tree dies the fungus dies, and thenceforth will absorb no more moisture than the soundest part, and is alike imperishable, contrary to common experience in such cases. This is a timber nearly as lasting as solid granite. For ship or boat lumber, the clear stuff from sound wood is so exceeding y light, stiff, and durable, and so plenty and available, that few timbers excel it, unless the yellow cedar or cypress (*Cupressus nutkaensis*) is excepted, which is a little tougher, stronger, perhaps more elastic, and equally durable, if judged apart from thorough tests and careful data, which, it has been remarked, the apathy or ignorance of some governments appear to deem unworthy their sublime attention. There are said to be in California a thousand times more and better kinds of naval timber on government land as important to preserve as the live oaks of the South Atlantic states. It has been asserted as possible that, after due investigation, California would be found to possess a vast amount of the best naval timber in the world, a hundredfold more lasting than the best now in use, if a few woods are excepted, of which there is understood to be no very adequate supply.

The great Washington cedar (*Sequoia gigantea*) is another important California tree. The great sequoian timber belt lies along the Sierras, upon the first exposed mountain side—moraines of recent retiring glaciers—that face the Pacific, from Calaveras on the north to near the head of Deer Creek on the south—a distance of 200 miles, or a little above 38 degrees north to a little below 36 degrees; altitude 5,000 to 8000 feet and rarely 8,400 feet. The belt is broken by two gaps, each 40 miles wide, caused by manifest topographical and glacial reasons, one gap between Calaveras and Tuolumne, the other between Fresno and Kings river; thence the vast forest trends south, across the broad basins of Kaweak and Tule, a distance of 70 miles, on fresh moraine soil, ground from high mountain flanks by glaciers. The inscriptions are scarcely marred by post glacial agents, and the contiguous water-worn marks are often so slight in the rock-bound streams as to be measured by a few inches. Rarely does one of these sound and vigorous cedars fall, and those that do will lie 800 to 1000 years, scarcely less perishable than the granite on which they grew. The great sequoian ditches, dug at a blow by their fall, and the tree tumuli, always turned up beside the deep-root bowls, remain; but, scientists assert, not a vestige of one outside the present forests has yet presented itself, hence the area has not been diminished during the last 8,000 or 10,000 years, and probably not at all in post glacial times. These colossal sequoias rise 275, 300, and even 400 feet aloft; are 20 to 30, and in some rare cases 40 feet in diameter, looking like vast columnar pillars of the skies. No known trees of the world compare with them and their kin, the redwoods, for the focused proximity of such a marvelous amount of timber within limited areas—as it were, the highest standard of timberland capacity. The stage coach passes through one; 120 children and a piano crowd inside another; a trunk furnishes a house for cotillon parties to dance "stout on stumps;" a horse and rider travel within the burnt out hollows of others, and so on. A single tree would furnish a two-rail fence 20 to 30 miles long. The tree has great value for wood and lumber.—*Northwestern Lumberman.*

A FRENCH COMPANY.

Commenting on Mr. Senecal's late visit to Europe the *Witness* says: "Another great scheme said to have been inaugurated in Paris is a new colonization company, which, it is said, will be formed with a capital of $10,000,000, to acquire lands for colonization purposes in the province of Quebec. Lumbering operations will also be included in the business of the company, as well as mining operations of all kinds. The company, after making all preparations, such as the building of houses, etc., will bring immigrants from all parts of the old world, and give them a house, with a certain lot of land; thus the immigrants will have every convenience. It is also the intention of the company to construct large grain elevators for the purpose of storing grain in the winter at some central shipping point. The company will also, if circumstances warraut it, extend their operations to build large mills, and instead of exporting the wheat they will export the flour. It will make an endeavour to manufacture a great portion of the North-West wheat and export it as flour."

U. S. WOOD AND LUMBER TARIFF.

The committee of ways and means have completed the wood and wooden ware schedule of the proposed tariff, and the bill which they are preparing will, unless changes are hereafter made, provide for the following rates of duties:

Timber, hewn and sawed, and timber used for spars and in building wharves, 15 per centum ad valorem.

Timber, squared or sided, not specially enumerated or provided for in this act. ¾ cent per cubic foot.

Sawed boards, plank, deals and other lumber of hemlock, whitewood, sycamore and basswood, 75 cents per 1,000 feet board measure: all other varieties of lumber, $2 per 1,000 feet, board measure. But when lumber of any sort is planed or finished, in addition to the rates herein provided, there shall be levied and paid for each side so planed or finished 50 cents per thousand feet, board measure; and if planed on one side and tongued or grooved, $1 per thousand feet, board measure; and if planed on two sides and tongued and grooved, $1.50 per 1,000 feet, board measure.

Hubs for wheels, posts, last blocks, wagon blocks, ore blocks, gun blocks, heading blocks and all like blocks or sticks, rough hewn or sawed only, 20 per centum ad valorem.

Staves of wood of all kinds, 10 per centum ad valorem.

Pickets and pailings, 15 per centum ad valorem.

Lath, 10 cents per 1,000 pieces.

Shingles, 35 cents per 1,000.

Pine clapboards, $1.50 per 1,000.

House or cabinet furniture, in piece or rough and not finished, 30 per centum ad valorem

Casks and barrels, empty, sugar box shooks and packing boxes, and packing box shooks of wood, not specially enumerated or provided for this act, 25 per centum ad valorem.

Manufactures of cedar wood, granadilla, ebony, mahogany, rosewood and satinwood, 35 per centum ad valorem.

Manufactures of wood or of which wood is the chief component part, not specially enumerated or provided for in this act, 35 per centum ad valorem.

Wood, unmanufactured or not specially enumerated or provided for in this act, 20 per centum ad valorem.

The changes made in the above list from the existing tariff commission report are as follows:

On hewed and sawed, etc., the present tariff is 20 per cent. ad valorem; the commission report is 20 per cent.; the committee reduce to 15 per cent.

On timber squared and sided the present duty is 1 cent per cubic foot; the commission report in favor of the existing rate; the committee reduce to ¾ cent per foot.

On sawed boards, planks, deals, etc., of hemlock, whitewood, sycamore and basswood the existing rate is $1 per thousand feet board measure. The tariff commission report is the same. The committee cut this down to 75 cents per thousand feet.

All other varieties of lumber are unchanged at $2 per 1,000 and existing rates on planed and tongued and grooved lumber are adhered to both by the commission and the committee.

On hubs of wheels, posts, last blocks or rough hew or sawed existing rates are continued,

Staves of all kinds are placed at 10 per cent., both by the committee and the commission. The existing rate of 20 per cent. on certain undressed staves appears to be put in the 10 per cent. class.

The committee put the duty on pickets and pailings at 15 per cent. ad valorem. The commission reported in favor of 20 per cent., which is the present rate.

Laths are put at 10 cents per 1,000 pieces. The commision reported in favor of continuing the existing rate, 15 cents.

Shingles, cabinet furniture, dressed and undressed, are maintained at the existing rates. Empty casks and barrels, sugar boxes, shooks and the like are placed by the committee at 25 per cent. ad valorem. The commission recommended 30 per cent., which is the present rate.

Pine and spruce clapboards, manufrctures of cedar wood, etc., are maintained at existing rates.

SWEDEN.

THE Stockholm correspondent of the *Timber Trades Journal*, writing on Dec. 16, says:—Since my last report there is a decided stiffening feeling prevalent amongst holders of sawn stocks in the north of Sweden. As far as can be ascertained, this alteration has been brought about partly by the issue of a very favourable circular from the leading Loudon brokers, and partly by the fact of two or three good contracts having been closed in Hudikswall and Gefle districts, at prices very near to those of last season. Nevertheless, looking to the extraordinary shipment of the past year, and the heavy stocks that are supposed to exist in at least two of the principal shipping districts, it will probably not be considered wise to stand out for the full prices obtained during the early part of the past season. This applies to redwood, but as for whitewood I cannot see that there is any necessity for our Sundswall and Hernosand exporters selling at the low figures they are said lately to have done. The prices of similar goods from Canada, coupled with the decrease of production in the Riga and contiguous districts, consequent on the burning of mills, stocks, &c., and the difficulty experienced in getting anything insured during the terrorism prevailing there, should enable Swedish holders of whitewood to insist on last season's figures at the very least. It may, I think, be taken for granted that anything less than £5 per standard for unsorted white battens f. o. b. Sundswall or Hernosand does not leave a living profit, taking the risk of six months' credit into consideration, and there would be no difficulty in obtaining this figure at present, were the smaller mills in the two districts referred to not in the habit of loading themselves with goods beyond their financial powers.

IMPERFECT APPLICATION OF CREOSOTE.

A correspondent of the *Timber Trades Journal* says:—It is important that the attention of those who make the creosoting of timber their business should be directed to the imperfect manner in which a great deal of the creosoting work is now being done. I have it in my own knowledge that, in the case of an order for wood recently ordered to be creosoted, the wood was *dipped* in the creosote instead of the oil being *injected into it* by pressure.

When wood which has not been previously dried has applied to it a coating of creosote, or any other material which clogs the passage of air from the interior, the elements of decay, being confined, rapidly assume activity, and consequently the application is more hurtful than advantageous. This fact does not appear to have received general recognition, and the system, therefore, of simply *tanking* wood in creosote continues in existence.

I would advise engineers and others who may be making use of creosoted timber to apply the test, here and there, of having the wood sawn though, so that it can be seen whether the creosote oil has thoroughly penetrated the wood. The test is an easy and satisfactory one, and I understand that in cases where it has been applied it has been found that the application of creosote has been of a most superficial nature, and that in consequence the wood has been returned to the senders.

A Successor to White Pine.

A noteworthy fact in the lumber business of Chicago, says the *Times*, is the annual increase in the supply of southern yellow pine manufactured in Missouri and the gulf states. By many it is claimed that this lumber will be the successor of white pine in western markets should the supply of the latter cease as soon as now predicted. At this time, however, the cost of transportation does not allow large shipments of southern lumber, and long timber and dressed flooring are the only grades of yellow pine sold in Chicago. The latter, being dressed before shipping, is greatly reduced in weight, and at current prices affords a satisfactory profit. Enough lumber has already been received from the south to remove any fear of a lumber famine in this city for many years, as, if it can pay present rate of freight, it will come naturally to a large market when the sonth has more railway competition, which increasing wealth and enterprise are sure to supply.

Letter from Member of Congress.

HOUSE OF REPRESENTATIVES.
Washington, D.C., Feb. 19, '82.

GENTLEMEN,—Inclosed find $1, and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a bad cold, as has almost every one else here, but cannot find the Elixir, which I used frequently at home and consider a most valuable medicine; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GRANT.

WOOD OR IRON.

The Montreal *Gazette* says:—The great fire which did so much damage in London on the morning of the 8th instant brought out a fact with regard to the use of iron girders in buildings which is worth reproducing. Speaking of the heat evolved by the rapid combustion of the highly inflammable materials which fed the fire, the London *Daily Telegraph* says:—"It is of interest to note the effects of intense heat like this on different constructive substances. There has been a tendency of late years to trust to iron, but yesterday's test was altogether unfavourable to this substitute for wood. An experienced officer of the Fire Brigade remarked: "Whenever we know there are iron girders and pillars, we give them a wide berth. They expand so much that you can never be certain of them. Take a floor resting on wooden beams—say, twelve inches by eight. It will burn for hours without giving way, and will not swell at all nor displace any part near it. Not so with iron; it soon becomes red hot, expands with terrific force, and, as I think, does more harm than good." This view was confirmed by the fact that buildings like the Curriers' Hall, the rear walls of which were subjected to a terrible scorching, escaped with little damage, while in no case did the iron partition seem to be of avail. Mr. Simon, the second officer of Captain Shaw, * * was directing operations on the top floor of the warehouse of Messrs. Rylands on London-wall. The roof was ignited, but the firemen were gaining upon it. Between the upper storey and the next building there was the protection of a stout wall, the only communication being barred by an iron door. Presently the door was red-hot, then it burst in through the resistance of the walls to its own expansion, and in a few seconds the whole of the floor was ablaze, the Brigade with difficulty effecting their retreat." Such experience is strong confirmation of the view expressed above.

The Toronto Trade.

The *Mail* says:—The lumber trade of this city during the year 1882 has been rather larger than that of 1881. There was more demand from outside upon merchants here, and local consumption was also about equal to that of the previous year. The supply last year of lumber was not so large as was expected, or hoped it would be, owing to the want of snow in the woods. And the average prices of lumber were therefore higher than would have been the case if the operations had been more successful in the woods.

After giving the figures of the CANADA LUMBERMAN for the year's business the *Mail* continues: The prospects for a large trade this year are very fair. There is no question about the steadiness of the market. The demand from Manitoba is expected to be again large, and the American market is certain to be at least as good as last year. There is said to be now some trouble in the woods from snow, which is to deep for profitable work. But this is better than having too little, as was the case last year. And the cost of supplies and wages this winter are in the lumberman's favor. It is thought the production will equal what it was last year.

Preserving Posts.

A writer in an exchange says: "I discovered many years ago that wood could be made to last longer than iron in the ground, but though the process so simple that it was not well to make a stir about it. I would as soon have poplar, basswood or ash as any other kind of timber for fence posts. I have taken out basswood posts after having been set for seven years and they were as sound when taken out as when first put in the ground. Time and weather seemed to have no effect on them. The posts can be prepared for less than two cents apiece. This is the recipe: Take boiled linseed oil and stir in pulverized coal to the consistency of paint. Put a coat of this over the timber, and there is not a man that will live to see it rot."

THE Ottawa lumbermen are suffering inconvenience from the dangerous character of the ice on the lakes on the Kippewa and other lumber districts.

The Duluth Lumber Lands.

The *Northwestern Lumberman* says:—The Duluth land sales were finished up on Saturday, December 16, on which day a few less than 500 sales were made. In township 64 there was 188 sales; in township 65, 172 sales; 62 sales in township 63, and 40 sales in township 62. As high prices as $10.50 and $17.50 are given in the published reports of the sales, but a great deal of the land went at $1.25, or between that figure and $2. The sales lasted two weeks, and Uncle Sam has gone home with his pockets jingling with monopolistic coin.

THE Lindsay *Post* says:—We believe that Messrs. Needler & Sadler are contemplating putting in a 30-h. p. engine to drive their sawmill during the low water season. This improvement, if carried out, would probably be available to give additional power to the waterworks pumps at a time of the year when such assistance might be necessary.

THE Ottawa *Fress Press* says:—Mr. J. G. Doherty, of this city, who is engaged in the manufacture of portable houses, and had the contract for those supplied to the Government at Regina, is in Winnipeg. He contemplates the starting of a manufactory at Winnipeg or some other point for the manufacture of these houses.

A WRITER on the health of London, England, recommends that trees be thickly planted between that city and the swamps of Essex and Kent. The idea is not merely to reclaim these marshes, but to make the trees a barrier against the winds which now drive malarious air into the city. The trees may be set out without danger, provided the work be not done at night.

THE Montreal *Gazette* of Jan. 4, under the head of "lumber," says:—The only thing worthy of remark in this line of trade is that a slightly better local demand has been experienced since our last report at steady prices. The demand for hardwood continues good, stocks are none too heavy and the outlook is favourable for a healthy year's business.

THE stock of deals in St. John, N. B., held for European markets amounts to 59,000,000 feet. Of this amount 37,000,000 feet are owned by Mr. Alex. Gibson, 12,000,000 feet by Messrs. R. A. & J. Stewart, and 10,000,000 are in the hands of other shippers and owners. All of the stock is sold for shipment except 31,000,000, and 25,000,000 of these are held by Messrs. Carlton Bros., Carleton.

AN Ottawa correspondent says:—R. A. Campbell & Co. are building a new steam saw mill at Lachute, the dimensions being 56 by 112 feet. It will be completed by May next. The sawing capacity of the new mill will be about 25,000,000 feet in the season. Messrs. Ingl's and Hunter, of Toronto, have the contract to put in the boiler and engine, while Messrs. Stewart and Fleck will supply the remainder of the machinery. Mr. E. Bullis is erecting the new structure.

THE *Timber Trades Journal* says:—It is the opinion of many in the trade that the development of steam traffic in the timber trade will ultimately result in the establishment of lines of steamers from many of the Swedish ports. Only those established in a considerable way of business are able to deal with an entire steamer load; but when lines of steamers are running to the wood ports, it will, doubtless, be quite feasible to import small parcels of stock, say 50, or even 20 standards. It is not at all improbable that the trade may progress in this direction.

WALTER LINTON, of Waterloo, writes that Hagyard's Yellow Oil has done great good in his family, his wife being cured of Callouse lumps that other medicines failed to remove, he he also states that a neighbor was promptly relieved of Rheumatism by the same remedy.

WORTH KNOWING.—A Fact Worth Knowing. The best household remedy known for Coughs, Colds, Bronchitis, Asthma, Whooping Cough and all throat and chest troubles tending toward Pulmonary Consumption is Hagyard's Pectoral Balsam, to be procured of any druggist.

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:
JAMES EPPS & Co., Homœopathic Chemists,
18Lly London, England.

EARS FOR THE MILLION
Foo Choo's Balsam of Shark's Oil
Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.
This Oil is abstracted from peculiar species of small White Shark, caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has Existed among the Chinese People. Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!
It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*
☞ To avoid loss in the Mails, please send money by REGISTERED LETTER.
Only imported by HAYLOCK & JENNEY,
(Late HAYLOCK & Co.)

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. JAN. 15, 1883.

THE German empire has now about 34,000,000 acres of forest, valued at $400,000,000, and appropriates $500,000 every year to increase and maintain the growth of trees.

MR. R. NAGLE, lumberman, has disposed of a timber limit of 150 miles on South River, Lake Nipissing, to Mr. Alexander Fraser, of West Heath, the price paid being $150,000.

THE Midland *Free Press* says:—Shipments of lumber are going on steadily at the British Canadian mills, Chew's mill and Dollar's notwithstanding the deep snow that prevails.

THE *Monetary Times* in its Montreal report says of lumber:—Business continues dull, and is likely to remain so for a while. Lumberers as a rule have made their calculations to produce largely, and the season promises well so far, for snow has fallen plentifully in lumbering sections as a rule.

WM. & GEORGE STUBBS, at Moose River, Lake Winnipeg, have erected a mammoth saw mill. They have 75 men at work in that vicinity, and will probably cut enough logs to manufacture 5,000,000 feet of lumber next summer. They also intend getting about 1,500,000 feet out of the Winnipeg River.

THE Lindsay *Post* says:—We believe that Messrs. Needler & Sadler are contemplating putting in a 30-horse-power engine to drive their saw-mill during the low water season. This improvement, if carried out, would probably be available to give additional power to the waterworks pumps at a time of the year when such assistance might be necessary.

A REMARKABLE statement was made recently before a scientific body in London—the statement given is on the authority of Mr. Veitch, the well known authority on "Coniferæ"—that the cones of many of the species on the Pacific coast never open and permit the seed to escape unless opened by a forest fire, when they fall out and replenish the burned waste. "They hang on the trees for many generations—even for thirty years."

A KINGSTON despatch says:—Messrs. Rathbun have effected a contract to furnish the Canada Southern railway with from 120,000 to 200,000 railway ties. The same firm have also recently received orders for a larger number of doors for South Africa and Kingston, Jamaica. Including those engaged in logging operations, there must be at present 1,000 men on the pay roll.

OLD Italian oak is of the darkest and richest brown, and is very rare. A masterpiece of antique carving in this material is conspicuous upon the lid of a coffer, which is supported upon the shoulder of griffins with glaring eyes and fangs. Upon the front a sea piece, with Neptune riding his sea horses and triumphant over sea monsters, is wonderfully reproduced in carving.

THE old machinery of the big mill at Deseronto has been taken out, in fact, scarcely anything is left but the walls and roof. A large force of skilled mechanics are replacing the woodwork and preparing the foundation for the gangs. The new machinery when in operation will have cost the firm about $50,000. The estimated output for next season exceeds 30,000,000 feet.

THE *Northwestern Lumberman* says:—A tall story is told of a woman of Arbela, Mich., who, it is said, has gone into the woods with her husband and done her half of the sawing, splitting, and piling four cords of wood in a day, and can keep it up for any length of time. She weighs 120 pounds, and is 38 years old, of English descent, and the strangest of all is she says she never saw a tired day in her life.

THE Duluth *Lake Superior News* says:—The lumber business only as far back as 1878 was dependent upon two or three small mills that turned out annually ten or twelve million feet. The past year the cut at the immediate head of the lake alone amounts to 94,500,000 feet, and in Duluth district to 145,000,000 feet. The amount of logs under contract to be cut this winter in this district is estimated at 315,000,000 feet.

AN Ottawa correspondent says:—R. A. Campbell & Co. are building a new steam saw mill at Lachute, the dimensions being 56x112 feet. It will be completed by May next. The sawing capacity of the new mill will be about 25,000,000 feet in the season. Messrs. Inglis & Hunter, of Toronto, have the contract to put in the boiler and engine, while Messrs. Stewart & Fleck will supply the remainder of the machinery. Mr. E. Bullis is erecting the new structure.

MESSRS. WANZER & Co., Hamilton, are erecting a new building, 250x60 feet, three stories high, for the purpose of manufacturing the wood work of their sewing machines. The machinery, to be operated in this building, is valued at about $30,000. The power to drive this will be furnished by one of Killey & Co.'s 300 horse power engines. As an evidence of the growth of the export trade of Wanzer's concern it may be stated that 1,000 of its machines are now used in Africa.

EDDY'S NEW MILLS.

Work is being carried on with wonderful rapidity at Mr. E. B. Eddy's new mills in Hull. The irregular bottom of the new sawmill has been filled up with massive timber cribbing and broken rock making it almost as solid as rock. The northern wall is up and presents a massive appearance as does the part of the southern wall which is almost complete. The floor being laid down is three inches thick and will be more solid than any in the city. Situated on this floor are four posts on which are electric lamps which are used at night to enable large gangs to work. Altogether there are over a dozen electric lights going at night and this enables twice the work to be done that would otherwise be possible. The motive power for the generator is furnished by the water wheel in the machine shop. In this building everything indicates a rush of business. A large number of machinists are engaged turning out shafting and everything required in rebuilding or refitting a mill. The massive planer and turning lathe which went through the fire are again in first class order and none the worse of the test. Other machines have been added and the shop is in full blast. The pail and tub factory presents a lively appearance. All the floors are replaced, and the walls have been thoroughly plastered up, and are apparently as strong as ever. Machines are already being placed in position, and hundreds of feet of shafting are suspended in position from the ceilings. A very noticeable feature here is the heavy timbers to which the pullys and shafts are attached. From the way work is being pushed on at present, it is not at all unlikely that work will be commenced early next month. Several wood working machines, including planer and morticer, have been placed in the new building erected on the site of the old sash and door factory. Next door is the blacksmith shop, which is the scene of industry day and night. In both of these buildings are electric lights. The masonry and carpenter work is going on marvellously, large gangs being engaged drawing, framing and placing massive beams in position.—*Ottawa Free Press.*

HOW WOOD WILL LAST.

The following testimony to the durability of wood is published: Charred wood, or charcoal, is almost indestructable, whether exposed to the air, buried in the ground or placed under water. Wood, in its natural state, well seasoned and kept dry, may be eaten by worms; if wet and dry alternately, it rots; if kept wet all the time it lasts a very long time—though how long nobody knows. One of the piles of a bridge built across the river Danube by the Emperor Trajan, when taken up in recent times, was found to be petrified to the depth of three-forths of an inch, but the rest of the wood was little different from its ordinary state, though it had been driven more than 16 centuries. The oldest wood bearing the marks of human labor is said to have been found in some of the tombs at Thebes, and comprised two wooden statues a little larger than life. The oldest timber afloat is probably in a ship now sailing from Holland, that was built in 1563, when the Prince of Orange was fighting Phillip II, of Spain. In digging away the foundation of old Savoy Palace, which was built nearly 700 years ago, the whole of the piles, consisting of oak, elm, beech and chesnut were found in a state of perfect soundness, as was also the planking which covered the pile heads.

TIME TO FELL TREES.

Mr. Edmund Hersey, a farmer of exceptional intelligence and practical culture, says observation of the changes in the living productions of the earth has been a continual source of joy to him, though able to comprehend little of the marvellous teaching. His investigations have been especially directed to forestry and woodcraft during a considerable part of his life, cutting, seasoning and working up various kinds of timber in the different months, sometimes to the extent of nearly a thousand cords a year. The chemical laboratories of nature so minute yet so wonderfully efficient, are not open to him, he simply contemplates results as disclosed to "eyes that are holden." These, so far as they relate to the subject of our head line, he condenses as follows in the Massachusetts *Ploughman*:

"For strength, beauty and durability I have found August, September and October the best, and February, March and April the worst months to cut wood. A red maple cut in September will keep in a round log perfectly white and sound until the next August; while one cut in March will begin to blacken and decay by the middle or last of June. This is not copied from any scientific work, but is what I have found to be a fact by many practical tests. Gray birch cut in September will keep in good condition until the next September if left in the woods, cut in four-foot lengths; while if cut in March and left in the same way it will be nearly worthless by the first of August; at least such is the result on my land. White pine, like the red maple, keeps white much longer if cut in September than if cut in March, and is not injured by the worms as much. I have found that wood dried slowly in a cool place is better than that dried quickly in a hot sun, even though cut in summer. May this not, in a measure, account for wood being better cut in autumn, it having the long cold winter to dry in?"

THE MICHIGAN LAW FOR TREEPLANTING BY THE ROADSIDES.

The *American Journal of Forestry* says:—The Consolidated Road Act of Michigan, approved June 8, 1881, presents one feature in respect to planting by the roadsides that deserves attention; and as the season has come around at which the Legislatures of most of the States are in session, we present below, so much of the law as relates to this subject. It will be seen that it is obligatory upon townships, unless by a vote at a town meeting, the citizens excuse themselves from its operation, and that unless so determined, the work must continue from year to year, until all the roads are planted.

We regard this law as eminently progressive, and especially worthy of imitation in the Prairie States:

CHAPTER X.

SHADE TREES AND WATERING TROUGHS IN HIGHWAYS.

"SECTION 1. Shade-trees shall be planted along both sides of the public highways, at the uniform distance, as near as may be, of sixty feet apart, and not less than twenty-three nor more than twenty-five feet from the centre line of the highway, but the township board of any township may direct as to the distance which trees may be set from each other or from the outer line of the highway. All trees now growing upon the sides of any highway, and all trees that may be hereafter planted thereon, standing more than 60 feet apart, shall be preserved, and shall not be injured or removed, unless by direction of the Commissioner of Highways, and with the consent of the owners of the adjoining land, unless such trees shall interfere with or obstruct the travel on the highway: *Provided*, That the provisions of this Chapter in whole or in part shall not be deemed mandatory in townships in which the electors may by vote at a township meeting thus determine.

"SECTION 2. Any person planting shade-trees along the highway adjacent to property owned or occupied by such person, shall be entitled to be credited twenty-five cents upon his highway tax for every tree so planted, but not to exceed in the aggregate twenty-five per cent. of such person's highway tax in any one year.

"SECTION 3. In road-districts where there are not trees planted and growing along the highways to the extent required by the first section of this chapter, the Commissioner shall require that at least 50 acres per year be so planted in each district, and shall require the same from year to year, until every highway in his township where the adjoining lands are cleared, is supplied with shade-trees, as contemplated by said first section, but not more than twenty-five per cent of the highway tax shall be appropriated for such purpose in any one district in any one year. The overseer, acting under the direction of the Commissioner may require twenty-five per cent of the highway-tax of any person in any year, to be paid in money, the same to be applied in planting shade-trees along the highway adjoining the property of such person. The overseer shall particularly attend to the planting of such trees, and shall allow no unsuitable tree, nor any tree wanting sufficient roots or vitality to be planted, and he shall have the charge of and care for the same in the best manner for their growth.

FORESTRY IN SWEDEN.

We take the following extracts from a paper contributed to the *American Journal of Forestry* by the editor, Dr. F. B. Hough. It is from an account of a trip to Swedeu:—

Aug. 8. Having called at the American Legation, and learned from our Minister-Resident, Mr. Stevens, that the Director of Forests, (Mr. C, A. T. Bjorkmanu), was absent, but that his deputy, (Mr. E. G. Sundberg), was in town, we called at the "*Skogs-Styrelsens.*" (Forest-Adminstration), aud made known the object of the visit. Mr. S. received us with the greatest civility, and afforded full information in the way of recent documents, blank forms, maps, and explanatory statements, concerning the forest resources of the country, and their

methods of management. The government has a Forest Academy adjacent to the city, near a public park, known as the *Djurgard*, (Deer-Garden). a place of great popular resort. It is on the main shore, but close by a large island, with many pleasant villas and beautiful walks. It is very easily accessible by steam ferries and tramway, and upon the grounds in the park are various statues and points of historical interest. The grounds of the "Skogsinstitutet," (Forest Academy), were closed for vacation, but the information already obtained from Mr. S. supplied the data for every thing relating to its organization, and the course of instruction. There are besides this, seven elementary forest-schools in Sweden, for the preparation of agents of lower grade. They are of an eminently practical kind, and a part of the time of the students is given to actual labours in the forests.

In former times, there were restrictive measures, with regard to private forests, which in time were removed, but now, there is a tendency in Sweden, to a return to a policy, which although it interferes with the enjoyment of personal rights, appears to be dictated by necessity. In the district of Norrland, there has recently been established a restriction upon the size of trees that may be cut, the details of which we can not here give. They will be presented in our official report.

The forests of Sweden are chiefly fir, (*Picea excelsa*), and Pine, (*Pinus sylvestris*), with Birch, Alder, aud Poplar. Some oak is found south of of the Dalelf, and Beech, in the extreme south, opposite to Denmark. Besides these, there are some little plantations of White Mulberry, and other exotic trees. The total area of Sweden not covered with water, is 40,672,000 hectares, of which 4,693,000 are fields and meadows. Of the balance, about 40 p. c. of "terra firma" are forests, and of these two-thirds lie north of the Dalelf.

At the close of 1876, the woodlands in state parks amounted to 1,843,600 hectares;—state plantations on shifting sands, 2,200;—state woodlands not marked out 1,344,000;—woods on state domains and manses farmed on state account, 49,100;—ceded to officials, ecclesiasti cal and other, 530,900;—owned by public institutions, 35.60; granted to saw mills, 244,100;—grauted for metalurgical uses, 28.00;—owned by communes, 172,200; and owned by state manses, and in clearing concessions, 971,500, making a total of 5,221.500 hectares, (12,897,105 acres), under state control. The private forests of the country amounted to 30,757,000 *h.*, (75,972,260 *a.*), or about 85 p, c. of the whole.

A serious strike among laborers in 1870 in the Sunswald district, made it necessary to employ troops to prevent excesses. From this and other causes, the timber trade was disturbed, and of 890,000 dozen logs, but 500,000 dozen were got down to the Gulf of Bothnia in 1881.

Returning to Stockholm, we took passage iu the afternoon of the 9th of August for Hango, in Finland, near which place my Scotish friend of Haddington, thought I would find *Evois*, the next point of interest. It is the seat of a school of Forestry, under the direction of Mr. A. Blomquist. We had corresponded much with this gentleman for several years; he was expecting our arrival and many pleasant anticipations were borrowed from the near future, which were soon more than realized.

As we were going on board the Aura, a young man belonging to the Forest Aministration, who had been an eager listener the day before, came to place in our hands, a personal souvenir from himself, of several recent publications upon Forestry, and to ask some questions about the forestry of the future in America. Perhaps among the many thousands of Scandinavians who have found a home among us, there were some who were bound to him by ties of kindred —perhaps by something stronger. At any rate he was eagerly in quest of information about our woodlands, their extent, and their future prospects,—and we doubt not he could easily be persuaded to learn more about them by personal observations.

SUCCESSION OF FOREST GROWTHS.

Robert Douglas gives in a brief letter to the *Gardner's Monthly* some interesting facts concerning the succession of forest growths—the result of years of obscrvation. Where the forests are cut down, and the fires are kept out, they in the main reproduce the same species. But if a settlement is formed, and cattle are allowed to run into the cut-down woods, the seedlings are destroyed as they appear. In a burned forest everything is changed; all vegetation is swept away. Even the soil is changed, and its surface, if thin, is destroyed. After a forest fire, the first tree that makes its appearance is the aspen, a tree which naturally grows on moist lands, where its roots have the best chance to escape from the general destruction. According to Mr. Douglas, this tree predominates in burned forests in Colorado, Wyoming, Dakota, the Black Hills, Minnesota, Manitoba, Wisconsin and northern Michigan. In Wisconsin and the Black Hills it is mixed with the white birch, and occasionally, as in northeastern Wisconsin, the white birch is the chief tree. Both the seeds and trees of conifers are usually destroyed by a fire. Next to the aspen and white birch, those trees and shrubs spring up over burned districts which bear seeds that are either blown to great distances, remain long in a dormant state in the ground, or are carried by birds. Where the burned forests consisted of oaks and pines adjoining or partly intermingled, the oaks will be found after a fire crowding upon the pine lands. This is due in part to the fact that oaks renew themselves from the stumps, while pines do not, and that acorns are often buried by squirrels in spots favorable to their speedy growth.—*Northwestern Lumberman.*

CEDAR HOP POLES.

The Hamilton *Spectator* says:—Mr. S. W. Davis, of Bouckville, near Utica, New York, was in the city Thursday, and went north on the Hamilton and Northwestern to visit Beeton and the surrounding country in search of hop poles. He saw Brennen & Sons, of this city, while here, and will probably make an arrangement with them to buy some of their cedar poles in Cayuga swamp. Mr. Davis says that hops now being from 75c to $1.05 per lb., the people of Central New York are going to extend their hop fields very much next season, and will want a good many poles. He prefers cedar poles over hardwood because they last longer and are lighter to handle. They are very expensive in Central New York, and Mr. Davis thinks he can make a spec buying the poles in Canada. They will cost him perhaps ten cents each, and the duty going into the United States is 20 per cent.

A WONDERFUL TIMBER REGION.

Very far west indeed, in a lovely country which once belonged to England, but which was ceded to the United States in 1846, there grows the finest body of timber in the world. Fir and pine, oak and cedar, of unsurpassed quality, and practically unlimited in quantity, clothe the mountains, overhang the rivers, and shadow the plains of the Puget Sound district, in Washington territory. On a moderate estimate it is calculated that this region will yield the enormous and unimaginable quantity of 160,000,000,000 feet of valuable timber. The trees attain a remarkable development, both of height and beauty. The yellow fir is frequently found growing to a height of 250 feet; the white cedar to 100 feet, with a girth of over 60 feet; and the white oak to 70 feet; whilst ordinary sized specimens of the sugar pine yield from 6,000 to 8,000 feet of lumber each. For long after its discovery this marvelous store of timber remained undisturbed, its primæval quietness unbroken by the sound of the woodman's axe. But in 1851 a saw mill was built on Puget Sound, and thenceforward continually increasing inroads were made upon the forests, until to-day no less than fifteen such mills are at work upon it. The largest of these has a cutting capacity of 200,000 feet per diem. During the year 1881 the export of lumber from Puget Sound amounted to 174,176,700 feet, valued at nearly $2,000,000, and it is calculated that since the establishment of the first saw mill about 2,-500,000,000 feet have been cut. Yet in spite of this great tax upon them we are told that the forest remains, for the most part, in virgin condition, except for a short distance from the banks of the streams and estuaries. It is, of course, too late for regrets, but one cannot help reflecting that the loss of this magnificient region was indeed a serious one to the British Empire.—*Colonies and India.*

BUSINESS CHANGE.

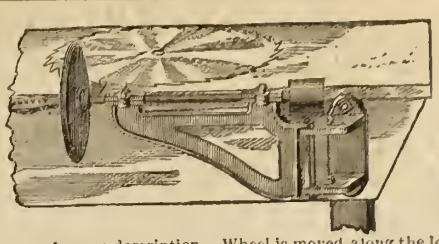
The Oswego *Palladium* has the following announcement in reference to Mr. S. P. Wigg, who has for some time past been managing the lumber business of Messrs. Ross & Co., at Lakefield, Ontario:

Ross & Co., who have done an extensive lumber business in this city for the past ten years, are succeeded by Mr. Wigg, an enterprising business man who understands the lumber trade and will push it to its fullest extent. Mr. Wigg will probably spend most of his time in Oswego. He has purchased the water front in the new harbor and adjoining premises running from Liberty street west to Crane, Belden & Co.'s property for a lumber yard, and will build a pier immediately and have it completed and ready for use by May 1, 1883.

Manitoba Trees.

The principal tree in the Manitoba woods is the poplar, the next in importance is the oak, and near the rivers will be noticed large elms. A very beautiful tree is the ash-leaf maple. Its fresh, green leaves open out in the spring. It is a most vigorous grower, and bears transplanting remarkably well. Were its qualities known it would be valued as an ornamental tree in any northern country. In the spring the ash-leaf maple yields a sweet sap from which excellent sugar can be made, the chief trouble is that at the time the sap flows the flooding of the river makes it difficult to reach the trees. On the shores of the streams which enter the Red River and especially near their mouths, basswood grows in great abundance, and ironwood of a large size can be met with.

It is stated that paper made from strong fibres—as linen—can now be compressed into a substance so hard that it can not be scratched with anything but a diamond. In view of this the *Paper Zeitung* thinks that before loug a great variety of honse furniture will be made of paper instead of wood.



To MILLMEN!

HODGSON'S
Patent Saw Grinder

is a new, efficient, and exceedingly cheap machine and is equally well adapted to grinding long and round saws of every description. Wheel is moved along the length, and in the depth of the tooth, and can be placed just were wanted as easily as a file. It is just THE THING for mills, cutting from one to five million feet of lumber, and costs no more than one-fourth to one-tenth the price of little better machines. It is patented in United States and Canada, and is made in Weisport, Pennsylvania, and in Amherst, Nova Scotia.

Hodgson's Patent Monitor Shingle Machine

combines, at a moderate price, more points of excellence than any other. Jointer is built in machine, a few inches from the saw. The cast steel feed rolls are opened by a foot lever, and grip the block like a vice. Traverse of carriage to suit large or small stock, is under control of operator when running. Will run for days without cutting a shim. Warranted to cut, with one attendant, three thousand in an hour, under forfeiture of $100. Send for circulars to

fL24 **T. HODGSON, AMHERST, NOVA SCOTIA.**

MINNESOTA
PINE LANDS
FOR SALE.

THE SUBSCRIBER OFFERS A TRACT OF

8,000 ACRES

Of PINE LANDS, in St. Louis County, Minnesota, carefully selected and estimated to cut **FORTY MILLION FEET**, well located on good driving stream, tributary to Duluth.

A. McCALL,

6L1 Lumber Merchant, Simcoe, Ont.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once, Costly outfit and terms free. Money made fast, easily, and honorably. Address TRUE & Co., Augusta, Maine.

DEAL FREIGHTS.

The London *Timber Trades Journal* says :—In our last issue we made some mention of freighting prospects for next spring from Canada, and it may not be uninteresting to take a glance at the freights paid during the year now approaching its close.

At the commencement of January vessels were chartered at St. John, N. B., (which port is always open, and from which deals are shipped all the year around), to the British chanuel at 60s. and 60s. 6d., and for the months of February and March 62s. 6d. was also cnrrent rate, thence to west coast of England and to Ireland, but from Halifax, N. S., in March small handy-sized crafts of 250 to 400 tons were chartered at 55s. This extremely low rate from Halifax is accounted for by the fact that all the neighboring deal ports on the Atlantic seaboard of Nova Scotia are closed at this period of the year with ice, and Halifax is the only port where they could get a charter or be loaded, unless they shifted around to St. John, which would be out of the question, on account of extra risk and loss of time. The month of April ushered in lower freights at St. John, commencing at 60s. to the Bristol Channel, then dropping to 55s. to Ireland, and charters were made at 50s. to 53s. 9d. from Nova Scotia.

This fall in deal frieghts was brought about be the numerous steamers which entered the deal trade being unable to get any freights from the United States ports, and it is known that some of the regular Atlantic liners, sailing between Liverpool, New York, and Boston, even paid the owners of grain to be allowed to carry it across to Liverpool ? This extraordinary state of things was owing to the great grain "ring" trying to "rig" the market, and preventing the shipment of it to this side of the water, and the latter was so effectually carried out that both steamers and sailing vessels were to be had so cheaply that one steamer was fixed at 46s. 3d. per standard. When it is borne in mind that it would be preferable for vessels to load grain in the States at 3s. 6d. per quarter to shifting to St. John, N. B., to load deals at 60s. per standard, it will give our readers an idea of the state of things in the month of April. The entrance of steamers for the past two or three years into the deal carrying trade has simply been occasioned by the non-shipment of grain from the States in the spring, caused by the "ring" of grain speculators in Chicago and New York.

Steamers continued to be chartered in the month of May at rates in the neighbourhood of 50s., while sailing vessels obtained 53s. 9d. to 57s. 6d. for Ireland, and 52s. 6d. to the Bristol Channel. As, however, the bulk of the deal chartering for the St. Lawrence, Bathurst, Miramichi, Shediac, Baie Verte, and the Nova Scotian ports is done on this side, charters were effected at 60s. from the St. Lawrence, 62s. 6d. from Bathurst, Miramichi, and Shediac, 60s. from Baie Verte and Nova Scotia, all for first-open-water loading. These rates remained about the same during the summer, but vessels were fixed on the Canadian side somewhat cheaper, The month of July showed freights at St. John 57s. 6d. to 60s., but in August the scarcity of vessels was felt, for rates went up at a bound in St. John to 70s. for Bristol Channel and Liverpool, while 75s. was paid to Ireland, and Nova Scotian shippers paid 67s. 6d. In August freights advanced at St. John to 72s. 6d., while in Nova Scotia 70s. to 72s. 6d. was freely paid, and charterers on this side came to realize that tonnago was scarce, as there was a scramble for ships to remove the autumn deals, and as much as 80s. was offered for vessels from Miramichi, Shediac, Baie Verte, Bathurst, &c., without avail, and the consequence is it is believed large stocks of deals are wintering over. Shippers were able to get a little relief by chartering steamers in Montreal and Quebec at 82s. 6d. to 85s., but not more than about half a dozen were available.

Timber chartering from Quebec was mismanaged by many firms in the fall, who refused ships on this side at 23s. to 24s. and 25s., but had in the end to pay 5s. to 7s. 6d. on the rates they could have got tonnago. The majority of people did not believe in the scarcity of tonnage, and could only be brought to believe in it by paying dearly for their disbelief, or being left without their stocks, and having to pay for the timber wintering on the other side, and remove it in the following spring.

There is no doubt the deal-carrying fleet from Canada is being seriously and continually lessened year by year without a proportion of new ships being built to replace those lost. Shippers live in the hope that steamers will permanently enter the trade and counterbalance the sailing tonnage lost, and no doubt many are fondly building their hopes on a repetition of what took place in the earlier part of this year. However, it is our opinion that charters effected on this side will be at an advance of at least a half-crown on the rates paid at the commencement of last season, and those that charter early will probably charter best.

BARREL MAKING.

The Ottawa *Free Press* says :—The invention of a machine that would manufacturc flour barrels equal to the hand-made article, has long been a subject over which more than one ingenious mechanic has cudgeled his brains. The old machine-made barrel without the bulge, which was turned out at Harriston, was an outcome of this desire and the best that had been achieved until about two years since, when Mr. Wright, a former foreman for Mr. Wm. Bell & Co., and who left that position to enter the employ of the Guelph Barrel Company at Harriston invented something better. His invention is altogether distinct from any machine which has ever been turned out for the purpose before. While the straight barrel was made in the one piece of veneer, very much after the style of cheese-boxes, Mr. Wright's machine turns out a regular stave barrel, which does not differ from the hand-made article, except that all are of uniform shape and perhaps more neatly finished than it would pay coopers to make them as a rule.

When it was seen that thore was something in tho invention, a number of Guelph gentlemen were induced to form what is now known as the Guelph Wright Patent Barrel Machino Co., for the purpose of manufacturing the machine. It has been a most expensive venture. Ever since the formation of the company they had a hard fight in court, both in England and in this country, with parties who had got hold of the idea and improved it. Now, fortunately litigation has ceased and the Guelph Barrel Machine Co. are the undisputed possessors of the invention, with patents for it in almost every country in Europe besides the United States and Canada. While they are having the machines manufactured at Galt by Messrs. Cant, Laidlaw & Co., the patentee is home in England, where he has succeeded in making further improvements, which may be attached to the present machine and will make the manufacture of barrels a more rapid process even than it is by the invention as it stands.

On Friday afternoon some gentlemen paid a visit to Dr. Cowan's cooper shop, in the rear of McConnell's carriage works, Eramosa Bridge, to see one of the new machiues at work. Although several barrels were set up in one minute's time, it was evident that the process would have been more speedily accomplished with stronger power. The gentlemen expressed astonishment with the invention and satisfaction with its work.

The simplicity of the machine cannot but give rise to wonder that it was never invented before. The staves are fed by hand on to a barrel-shaped revolving cyliuder made of four longitudinal iron sections. Two arms surround this cylinder at either end of it, and contract the ends of the barrel, while a small circular saw and revolving knife at either end cut off the staves to the exact length, and form the bevel and niche for the end pieces. Two hoops are then placed on, after which the moving of a lever causes the four sections of the cylinder to fall in, and the barrel is taken off set up. In the words of a cooper, the work of the machine is to "set the barrel up, cut the croze and champher the chime."

What effect will this machine have on the coopering trade? is a question naturally asked. Those engaged in it apprehend a complete revolution in barrel making and consequently have no praises to offer the invention. This can be understood when it is stated that one machine is capable of turning out from five to six hundred barrels per day, and at an estimatcd saving of 4c. on each barrel, as compared with the cost of making them by hand. Already the company has received quite a number of orders in Canada for machines from such millers as Mr. J. Goldie, and some of the smaller millers who have used the barrels speak of them in high terms. There is not the slightest doubt but the machine will come into general use and the result will be to amalgamate and centralize small coopering businesses, and to throw a large number of the mechanics engaged in that trade out of work. The company have a good thing, and if they word it properly should reap a fortune from it without much difficulty.

THE SUNK LANDS OF ARKANSAS.

KENNETT, Mo., Dec. 10.—The Sunk Lands, in southeastern Missouri, and northeastern Arkansas, are a sort of *terra incognita*. The country was formerly as beautiful and fertile a plot of land as any on the globe. Rolling prairies were shaded by heavy forests and traversed by two beautiful streams, the Little and St. Francois Rivers. The rivers still exist, but the general face of the country was marvellously changed by the great earthquake of 1811-12. These streams, instead of meandering through rolling prairies and primeval forests, now keep their tortuous courses by a chain of lakes and swamps of cypress and tupelo gum, draped artistically with elk vine and grey moss. It is a paradise of lowland scenery, from which millions of photographic views might be taken, leaving millions more of equal beauty untouched.

The Sunk Lands proper are 120 miles long and average 60 miles wide. They are diversified with beautiful lakes, rolling prairies, and dense forests. The lakes coutain much open water, and vary in depth from five to thirty feet. Some are covered with forests of cypress and tupelo gum festooned with moss and vines. While canoeing your way over these weird timber-grown lakes long vistas 'neath overarching trees and vines open up to view, and in the dim distance, seemingly miles away, so marvellous is the prespective, the waters of some open lake are tremulous with sunbeams.

Theso timbered lakes are a favorite resort for trappers and hunters. They annually capture thousands of dollars' worth of furs. Otters, beavers, raccoons, opossums, and muskrats are trapped by the hundreds. Fine game fish are also caught here.

The land is unusually fertile. Large farms under cultivation yield immense crops of corn, cotton, wheat, rye, oats, sorghum, potatoes, and other vegetables ; yet to a stranger the country seems like an unbroken forest. The timber includes the most valuable timber known to commerce, black walnut, ash, whith oak of the finest shipbuilding quality, post oak, cherry, maple, hickory, hackberry, cypress, catalpa, and sassafras. There is another species used for local building purposes, which, if it ever reaches a fair market value, will prove a source of great wealth. I mean the red gum. It is susceptible of a higher polish than black walnut. It will not split, and, when properly seasoned and dressed, makes beautiful boards, having much the appearance of cedar, or of the redwood of California. In all requirements save durability it fills the bill exactly for railroad cross-ties. A driven nail will not draw from this wood. When a process is discovered which will render it durable under exposuro of the weather it will be an invaluable wood.

The agricultural possibilities of these Sunk Lands are great. Before the war it was thought impracticable to grow cotton so far north. Now the average yield is about 1,500 pounds seed cotton, equal to three-quarters of a bale lint cotton, to the acre. This county raised and shipped last year in round numbers 15,000 bales of cotton, although lying in latitude 36° north. Hay is also a great product. Everything grows luxuriantly. The peculiar formation of the land renders it dry, and yet perfectly invulnerable to the ravages of the most continued drought. During the driest season of the year is not more than from six to eight feet down to the level of the surrounding lakes. The land is a rich sandy loam, highly porous. The moisture rises to the surface, Every morning the ground is moist and fresh, notwithstanding that on the day previous it may have been parched seemingly almost to a cinder by the burning sun and dry winds.

THE TORONTO OUTLOOK.

"Instead of anticipating any reaction in the lumber trade during the coming season," said a prominent lumberman to an *Evening Canadian* reporter this morning, "I predict a continuance of the boom that has struck our business. There is no sign of any diminution in the almost unlimited demand for stuff. Every one of my five mills is being heavily stocked, and I expect to turn out a quantity far in exess of that o any year yet since I began operations."

"What sort of a season has it been for the woods so far?" was asked. "Couldn't have been better," was the reply. "There has not been a superabundance of snow, or an excess of cold, and work at the shanties has gone on famously."

"How about prices?" the reporter enquired.

"Well," responded the lumberman, "I don't think they are going to advance much, if anything at all. It's just like this. At the opening of the season shantymen's wages went up, for they were in demand, and, knowing it stuck out for big pay. This, of course, put jobbers who had taken large contracts at a disadvantage. But then, on the other hand, mill men know that it is not a safe proceeding to let out a limit to be cleared at too low a rate, for the jobber knowing he will not get full rates for any but the best logs, will leave many a inferior one in the woods as not being worth his while to handle, notwithstanding that it would be worth the while of the mill man to handle it. So, you see, in the end a close contract does not always yield the best results to the lumberman, and most of us recognize this and govern ourselves accordingly. The output of all kinds of timber will be very large, and while the demand, as I have said, will not abate, the market will be in such a condition as to keep prices at a normal level."

"So the N. P. hasn't ruined the lumber trade yet?" queried the reporter, as he rose to depart.

"No, sir?" exclaimed the dealer, vehemently, "nor any other industry I know of. Newspapers and persons who go on berating the National Policy either do so from pure and simple factiousness, or else they are fools. And I'm no politician either, understand me!"—*Toronto Canadian.*

Stocks in London.

The London dock deliveries do not shake the adverse balance between this year and last ; there are still over 12,000 standards in arrear. The deliveries in 1881, however, surpassed those of the larger import of the previous year by 26,287 standards, though they fell off considerably towards the end of the year. In our impression of the 17th of December, 1881, the deficiency of the deliveries for the previous week as compared with 1880, was no less than 1,300 standards sawn and planed wood and 500 loads of square timber.—*Timber Trades Journal.*

A NEW paper and pulp mill has just commenced operations at Eau Claire, Wis., and the *News* of that place says it turns out print paper of excellent quality.

Just at the Wrong Time.

Mr. Robert Wilson, of the City Surveyor's office, and Street Commissioner of the Eastern Division for the Board of Public Works, Toronto, Ont., who is very fond of shooting, says : "To lose a duck hunt is a loss for which there is no adequate recompense. This misfortune lately overtook me. The boys got together recently and made arrangements for a good hunt. At the time the arrangements were entered into I was in good health generally ; but, just as the shooting was to take place, my old enemy, the rheumatism, came back to stay with me awhile again, and I had to forego the pleasure. The rheumatism has been a source of great bother to me, and I have done a great deal of doctoring for it, without much good. When this last attack came on me and crippled my hands so that they were drawn up, a friend of mine recommended St. Jacobs Oil, the Great German Remedy. I tried it, I am happy to say, and the result is that I am now cured and as well as ever. St. Jacobs Oil succeeded where more than a score of other liniments and medicines had failed."

Chips.

THE shipments of deals from Montreal during the past season, exceeded 44,000,000 feet, an increase of 190 per cent over 1881.

NINETY-THREE thousand acres have been planted under the new arboriculture act in Kansas. Proference is given to the cotton tree because of its rapid growth.

THE German empire has now about 34,000,000 acres of forest, valued at $400,000,000, and appropriates $500,000 every year to increase and maintain the growth of trees.

THE Ottawa *Free Press* says :—Messrs. McCracken & Boyle, lumbermen, are at present sending up a number of teams to their shanties in the Desert for the purpose of log-drawing.

THE Parry Sound *North Star* says :—The Midland & North Shore Lumber Co., are building a fine new iron burner at their mill. They are also overhauling the machinery and putting in some additional.

A STOCK of 250,000,000 feet of logs is calculated on for the supply of the Oscoda mills next season. Men were scarce and hauling did not commence until late, while cutting and skidding was also retarded in consequence.

THE red or sweet bay is an ornamental wood, which is practically inexhaustible in Florida. It is substantially the same as mahogany, and can be used in the same way, and for the same purpose, as the Honduras mahogany.

TWO hundred thousand dollars have been refused for 95,000,000 feet of standing pine in Bayfield and Douglas counties, Wisconsin. The land is owned by Reuben Whiteman, of Dansville, N. Y., and was bought in 1880 for about $50,000.

WILD cherry is a wood for which a large demand is springing up, which must inevitably make it very valuable in the future. It is used principally to supply the place of walnut. It is extremely close grained and can be very highly polished.

THE extraordinary durability of cedar is exemplified just at present in the removal of some timbers of that wood by the Canadian Pacific railway company, which were imbedded some seven feet in a bank over 80 years ago, and they are quite sound yet.

A CORRESPONDENT informs the London *Timber Trades Journal* of several somewhat important contracts for American joinery having been entered into for next season, and says that some shipments will be sent to Liverpool of an altogether novel character.

THE *Lumberman's Gazette* says :—There are on hand in Minneapolis, Minn., 100,000,000 feet of lumber, a stock not large enough to scare the dealers, for the booming northwestern trade ought to call for a good share of it before the next sawing season opens.

THE *Northwestern Lumberman* says :—A good depth of snow in northern Maine and the provincial borders encourages logging in an important section, for the operators go on the British side to get out logs, bringing them to American ground to saw them, and thus escape the Canadian duty.

THE *Timber Trades Journal* says :—It is most desirable that some better use should be found for the waste wood and sawdust so plentifully turned out at the large sawing and planing mills. We shall be happy to publish any reasonable suggestions, and invite correspondence on the subject.

THE *Timber Trades Journal* says :—It would be interesting to be made acquainted with the cause of the rapid decay of Miramichi and other similar pine deals when piled away in yard. Why Miramichi deals should be more prone to decay than Quebec deals we are unable to say, yet such is every often the case.

THE *Lumberman's Gazette* says :—When hardwood stumpage sells at the rate of $1 per cord, as lately reported at Duluth, the growing importance of that class of timber may be realized. There is still a mine of wealth undeveloped in the forests of Michigan, and as we stated a few weeks since, some of our pine lumbermen will soon begin to realize the vast source of wealth they have allowed to slip through their fingers in the lands which have reverted to the state after they have denuded the same of pine.

THE *Timber Trades Journal* says ;—The long continued wet weather is reported to have had a most damaging effect upon the appearance of the new deal piles. Much of the wood imported during the last two months is said to appear as weathered as that imported last season. Several cargoes of boards, which endured the last heavy rainfall whilst on quay, have been much damaged.

THE attention of western furniture manufacturers is being turned to the hardwood of the south as the source of future supply. It is rather vaguely stated, though probably true, that a western firm has sent an agent to the Piedmont region, western North Carolina, with instructions to purchase 100,000 acres of timber land, and others are taking similar measures to insure a supply.

THE Winnipeg *Sun* in an article on the Canada Pacific Railway says :—The cost of lumber consumed by the road was over ten millions of dollars. Sixteen million feet of this lumber were brought from Minneapolis, and it cost in Minneapolis $300,000, whith together with the duty and freight would make it cost over $550,000. Six million feet of lumber were brought from Keewatin. This cost at the rate of $25 per thousand feet.

THE Chicago *Lumber Trade Journal* says :—At the price list meeting of the Lumberman's Exchange, December 27, only one change was made. On 2x6, 12, 14 and 16 feet, $1 was taken off, and each member was privileged to make any special discount he saw fit on grades that he had a surplus of. The price list as sent out was practically endorsed as a farce. It will not strike any one as news, as nobody has thought of buying and selling on the list for some months.

THE London *Timber Trades Journal* says :—Little is now heard of the cheap English made doors, for the sale of which a few years ago there was intense competition. British makers have either discovered that the manufacturing of them did not pay at the low prices which were obtainable, or the signal cessation of speculative building has stopped the demand which once so largely existed. A very large business is still being done by the English joinery mills, but we understand that a superior class of joinery work is being made, and that many mills are manufacturing mostly from architects' drawiugs.

The New York *Times* says :—To enable the lumbermen to obtain a higher price for woods which they are rapidly exhausting, we tax imported woods, which in eight years will be our sole dependence, for one of the most important necessary articles in use. This is protection run mad. It is one of many instances in which Congress under the pretence of protecting American labor, imposes a tax on the livelihood of American laborers. Nothing can be plainer than that, instead of compelling our people, by an import duty on foreigh lumber, to use more of our limited and fast disappearing supply, we should admit such lumber free of duty.

THE decay of wood imbedded in the earth is difficult to guard against, but, according to the British Farmers' *Gazette*, a simple precaution costing neither money nor labor, will increase the durability of posts put in the ground by 50 per cent. This is simply by taking care that the wood is inverted, i. e., placed in the opposite direction to that in which the wood grew. Experiments have proved that oak posts put in the ground in the same position in which they grew, top upward, were rotten in 12 years, while their neighbors, cut from the same tree and placed top downward in the soil, showed no signs of decay for several years afterward.

THE *Timber Trades Journal* says :—Merchants at Gloucester are fairly stocked with spruce, and we believe one of the Canadian houses has a couple of cargoes yarded on Mr. Booth's ground, sooner than accept present low prices. The east coast houses have been competing keenly with the Gloucester merchants in the midland districts with Baltic whitewood, but now that spruce has come down again this state of things will cease. Cardiff houses have been importing spruce to Gloucester the last couple of months, which would not tend to improve the position of the trade here, but the buyers in the country would gain by this move of the Cardiff people. On the whole, we hear trade has been good, with fair consumption.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

Market Reports.

MONTREAL.

From Our Own Correspondent.

JAN. 10.—For the past two weeks up to Saturday last there have been so many holidays that business in the lumber trade has been quite at a standstill, but now that the holiday season is over,'some little improvement has been experienced in business during the past two days, and a good steady winter trade is now expected. There is some demand from Boston for ash lumber and several shipments have been made to that city. Hardwood is making in the townships for which they have had a favorable winter so far, and stocks are expected to be full next season. Prices of all kinds of lumber in our market are steady and very firm as under. We quote prices in the yards :—

Pine, 1st quality, ℔ M	$35 00@40 00
P ne, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00

CORDWOOD.

The severe cold weather during the past ten days or so, has caused quite a brisk demand for wood. Imports continue to be very limited, and there is very little stock in the city as compard with previous years, and as a consequence prices are high and likely to remain so till the opening of navigation. We quote ex cartage at the depot :—

Long Maple	$7 50
Short "	7 00
Long Birch	7 00
Short "	6 50
Long Beech	6 50
Short "	6 00
Long Tamarack	6 50

TORONTO.

From Our Own Correspondent.

JAN. 10.—The close of theholiday season has given retail dealers a fresh start, and the yards are nearly all in full blast again, some with whom I have conversed state that they are as full with orders as during the summer months; let that be as it may it is evident that there is little cause for complaint on the score of dull trade at the time of writing this letter. I for one had entertained the idea that we had already sufficient, and to spare, of empty houses, but some people seem to think otherwise, and so it goes on, and our fair city continues to extend her boundaries, and the outlook for the coming season is conceded by all who have the opportunity of judging to be excellent. Some large factories are now in the course of erection and other important manufacturers are on the lookout for suitable sites on which to erect large buildings. It is by this means that our city may look forward confidently to a large increase in population during the next decade.

Another retail lumber firm has opened up at the west end of the city whose shingle reads T. & S. Baldwin, both trustworthy young men, and if industry can build up a flourishing business they are sure to succeed. With the opening of the new year there have been some important changes in the personal of well-known firms doing business here. One member of the firm of Donogh, McCool & Oliver, wholesale lumber dealers, has retired, and the business is now continued by the first and last named, and doutless the remaining members of this firm are fully able to hold their own in the race for success. Another extensive building firm, that of Mr. Geo. Gall, has made the welcome addition of Mr. J. McCraken, formerly senior member of the firm of McCraken & Oliver, lumber dealers, and I believe it is their intention to combine the lumber trade with that of building and factory work in general, and both members of this firm being men of long experience and sound judgment combined with business tact and ample means they can hardly fail in building up a largely increasing business.

Prices at the yards remain firm at last quotations, and no surplus of stocks on hand beyond present or immediate prospective requirements.

CHICAGO.

The *Northwestern Lumberman* of Dec. 30, says: Reports this week from nearly all points west of the lakes indicate an extremely moderate trade. At some points there is scarcely anything being done. The large stocks on hand in all the leading market have made holders anxious to sell, and willing to do so at liberal concessions in price. This, together with the demoralization of freight rates, has led yard men thoughout the Northwest to stock up, and now it is generally the opinion that the country demand for the present is met. At the East the conditions are somewhat different, though assortments at New York and in the New England cities are quite full—not to that degree, however, that will carry the yards many weeks, under a good export and local demand, without some replenishment by rail. The wholesale yards at Albany have been made ready for such a demand, and the dealers will wait with gentle anxiety to see it come. Some descriptions of white pine, it is thought, will advance at New York, but there is no prospect of an immediate change in prices, though it is expected that they will hold firm. Yellow pine on the seaboard is still a drug. Spruce is in ample supply. Lath is quiet at firm prices, ranging from $2.40 to $2.50, and shingles are more active.

The stock on hand at Oswego is 216,000,000, as against 166,000,000 last year, and it has not appreciably decreased since the close of navigation. At Buffalo and Tonawanda, while the supply is larger than it was last year at this time, business is considered fair and prospects good.

Receipts, and stock on hand, of lumber, shingles, etc., for the week ending December 28, as reported by the Lumberman's Exchange :

Common	18 00@24 00
Culls	12 00@14 00

LONDON.

The *Timber Trades Journal* of Dec. 23, says: Even at tho Baltic this week things were dull. Certainly Messrs. Churchill & Sim did not offer a very large assortment of unreserved goods in their catalogue, which partly accounts for the attendance being hardly up to the average. No doubt it was best not to put any heavy parcels on the market at this dull time, and when the year has turned we shall probably have unreserved goods plentiful enough as of yore. If the saleroom itself was not crowded, however, the avenues leading to it were thronged with all the leading men of the trade, and doubtless being the last sale of the old year a great many were there out of curiosity to hear how things went. There were several of the reserved lots disposed of, amongst which a couple of lots of Montreal 1st bright pine regulars met with a buyer at £23 5s. per Petersburg standard, also a lot of Gromoff's 1st white Petersburg plank was knocked down at £11 5s., by no meaus a bad figure, taking into consideration the proximity of the holidays and the natural disinclitation of the trade just now to add to their stocks; still there was plenty of room for improvemeut ou the prices realized.

LIVERPOOL.

The *Timber Trades Journal* of Dec. 23, says: The imports during the past week have been composed chiefly of cargoes of spruce deals, and these goods now seem to come forward in quantities never anticipated even by those who are inclined to hold on to the old idea that they appear "to drop from the clouds."

With the near approach of Christmas holidays, there is naturally a very marked indisposition to do business, and any transactions entered into now will be confined either to retail transactions wherein the buyers require something for immediate delivery, or for delivery when the incoming year is advanced. The general tone of the market is therefore dull, as usual at this time of the year, and few important transactions have taken place recently, as buyers are not inclined to buy any cargoes, unless at a very low figure; and, on the other hand, sellers are not pressing their cargoes upon the market, hoping the new year will bring in brighter prospects. The general depressed tone of the market has been intensified in a degree by the suspension of the firm of Messrs. Davies, Williams & Co., timber merchants, of this city, with liabilities roughly stated at about £20,000, but nothing is as yet known of the probable amount of assets. The list of creditors is understood to include several foreign houses, who are represented directly or by their agents.

On Wednesday Messrs. Alfred Dobell & Co. sold by auction the cargo ex Guldfaxe from Oak Bay, Nova Scotia, without reserve, on account of the Bank of Nova Scotia, at which the following prices were obtained :—

Spruce deals—		£ s. d.		£ s. d.
16 ft. and upwards	3×11	8 0 0		
12 to 15 ft.	3×11	7 10 0	to	7 12 6
9 " 11 "	3×11	7 10 0		
16 " and upwards	3×9	7 10 0		
12 to 15 ft.	3×9	7 7 6	"	7 10 9
9 " 21 "	3×9	7 2 6		
16 ft. & upwards	3×7	7 0 0	"	7 1 3
12 to 15 ft.	3×7	7 0 0		
9 " 11 "	3×7	7 0 0		
16 ft. & upwards	2½×7	7 7 6		
9 to 15 ft.	2½×7	7 12 6		
9 " 26 "	3×12 to 17	7 2 6		
Deal ends		6 5 0		

TYNE.

The *Timber Trades Journal* of Dec. 23, says: The near approach of the Christmas holidays combined with the stormy weather experienced during the last few days have effectually put a stop to all appearance of business, and there has been therefore literally nothing doing during the last seven days. A few ships have dropped in from a late and stormy passage, amongst which are two Quebec vessels with the usual assorted cargoes. One of the Gothenburg steamers has also arrived, but the deliveries are of the most meagre character.

GLASGOW.

The *Timber Trades Journal* of Dec. 23, says: The additions to Clyde stocks of wood since last writing have been unimportant, and at this time of the year the quantity of goods changing hands is of course very limited. As indicated in last week's note, there is a comparatively fair supply of wood on hand at present in the various depots for storage of timber with which this market is in immediate connection. Yorkhill yards, where the great bulk of the deals (Cauadian and lower port) imported to Clyde are stored, have just now a well stocked appearance, although deliveries have been going on recently to a fair extent, the amount for November being 71,532 pieces, and since the beginning of December 35,719.

Most of the deals landed here have been per steamer, a small proportion only coming per sailing vessels. Of Canadian deals this year's import shows a considerable increase over 1881, while there is a large falling off this year compared with last in the number of Lower Port deals imported. Altogether the American deals imported to Clyde this year to date amouut to 1,233,000 pieces, as compared with 1,315,500 pieces last year.

ST. JOHN, N. B., SHIPPING.

The *Telegraph* says:—We publish to-day a statement of the new vessels added to the registry books of this port during the year 1882; of the old vessels transferred to St. John from other ports duriug the year and of the vessels written off our books, whether in consequence of being wrecked, broken up or transferred to other ports. The last named list is a very formidable one, comprising ninety vessels and including some of our finest ships. The new tonnage added during the year amounted to 13,049 tons; tonnage to the amount of 2,736 was transferred from other ports, making a total of 15,-

785 tons added during the year. This margin, under ordinary circumstances, should have left our tonnage at the end of 1882 fully up to the standard of 1881, but our losses were enormous, no less than 40,873 tons of shipping being written off the books of St. John during the year. Tne result is that the port of St. John, which this time last year had 270,186 tons of shipping on its books, has now but 245,118 tons, a lower figure than we have reached since 1871. This is partly due to the transfer to Liverpool of upwards of 20,000 of St. John shipping, including the whole Moran fleet, which, since the death of Mr. James H. Moran, has been registered in the name of his brother in Liverpool. It is mainly due to the difficulty of building wooden tonnage witb profit, tbe increased cost of building being an element in producing this result.

The following statement shows the tonnage of tbis port at the end of each year since 1870, inclusive :—

1870	214,814
1871	226,727
1872	246,485
1873	247,227
1874	263,410
1875	270,762
1876	280,073
1877	279,616
1878	276,016
1879	281,178
1880	275,897
1881	270,186
1882	245,118

BAND SAWS VS. CIRCULAR SAWS.

The question of the disadvantages of the circular saw over the band saw bas recently engaged tbe attention of tbe German industrial journals. The objections urged to the circular saw are, that it is very dangerous to the workmen ; requires greater power to drive it than any other kind ; makes a much wider cut, producing more waste and yielding less product from a given amount of material. The only advantage allowed by tbese papers to the circular saw is that it costs less than tbe band saw. The Mechanics' Association of Muehlhausen in its yearly report, advises that the circular saw be abolished wherever it is practically possible to do so, and in Germany this is possible in a great majority of cases.

This action towards tbe circular saw on the part of German mill men is perfectly practicable, and, indeed, a wise measure, in view of the scarcity of timber in that country, and tbe necessity of economizing its manufacture in every possible way. The band saw certainly possesses great advantages over the circular saw in the saving of raw material, this saving, in the opinion of persons who have used the band saw, amounting to fully twenty per cent. In fine woods, such as walnut, cherry, maple, ash, etc., this is an item worth looking after by our mill men, and it is well worth tbeir while to consider wbether tbe adoption of tbe band saw for cutting such woods would not be a profitable investment. For the rapid cutting of the coarser and more plentiful timbers, as oak, pine and poplar, the circular saw, of course, will continue to be used, as, witb our people, for a long time to come, rapid work, ratber than economy of material, will be the great object in lumber manufacturing.—*Southern Lumberman.*

The Forests of Grand Isle, Vt.

The region of Grand Isle, Vt., is said to have suffered a depletion of half its forest timber in the past 30 years. Hundreds of acres of land have been cleared entirely of heavy timber and reduced to tillage or pasture, and the forests now standing have been thinned out and culled extensively. It is claimed there is hardly a farm that could replace its cedar fence from its own forests, and scarcely one with sufficient to rebuild its dwelling and out-buildings, while on many farms there is no timber for fuel. Little or no timber planting has been done. The island was at one time famous for its magnificient oaks, the stumps of many grand trunks still standing, and there is hardly a pine tree fit for a spar. Every farm once had a sugar orchard, and now there are hardly any that can be worked. In fact, the oak, pine hemlock, tamarack, cedar, and maple are practically exhausted, though at first blush it might seem that the forests were quite extensive. The few groves of second-growth cedar are being largely utilized for hop poles, which bring, standing, 2 or 3 cents each, but if left to grow about 20 years or so they would be worth about $1 each for posts, telegraph poles, or ship knees.—*Northwestern Lumberman.*

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and Account Books of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

Books taken out in parts, Bibles, Works of Art, Illustrated Works, Music Books, Magazines, Perodicals and Newspapers bound in any style desired.

Old Books, Albums, &c. Repaired and Rebound.

Maps, Pictures, &c. Mounted and Varnished.

Names Lettered in Gold Leaf on Presentation Books, Bibles, Purses, &c.

THREE FIRST PRIZES FOR BOOK-BINDING AT THE CENTRAL EXHIBITION.

Printers, Bookbinders, &c., PETERBOROUGH, Ont.

GAS METERS AS HELPS TO FIRES.

In most buildings designed for multiple tenancy, like great apartment houses and the capacious office buildings which comprise so large a part of the business part of a city, it is customary to provide a separate gas meter for each room or suite of rooms. These meters are commonly placed in closets and out of the way corners, and are very apt to be surrounded with much combustible matter. The connections of meters with the gas pipes are usually, if not always, of lead, a metal that is easily fusihle, and the solder with which the plates of the meter are joined together yields even more readily to heat. Let a fire break out in a building containing, as many huildings do, a score or more of these fragile fire feeders, and the hot air sweeping in advance of the fire will quickly melt the lead or solder. The outpouring gas fills the building with an explosive atmosphere which hastens the spread of the flames and keeps up an inexbaustible supply of fuel. Such burning as gas jets, sometimes of great size, are to be seen after almost every city fire, when nothing is left of a building but blackened and broken walls. The gas poured into burning buildings through such openings douhtless helps materially to account for the surprising suddenness with which many buildings have been swept hy flames, and in all cases the outflow of gas must seriously counteract, if it does not altogether thwart, the efforts of the firemen. The remedy for this great evil is not so easy to point out. It is obvious that where a multitude of meters are to he distrihuted through a building they should be more securely incased and provided with infusihle connections, or some means should be devised whereby the gas supply shall be automatically shut off whenever the temperature rises so as to imperil the integrity of the meter. There should also be near the outer door and readily accessible to firemen, some means by which the connection of the house with the gas main in the street can be quickly closed. There is clearly an opportunity here for useful and profitable invention.

WOOD PULP.

The *Lumberman's Gazette* says :—One of the astonishing results of the wood-pulping and paper-making processes, lately introduced, is the conversion of the whole of a sapling pine into paper, without any waste. In Massachusetts, and others of the New England states, there are large growths of these pines, which are too small for box boards, and which will not pay for the cutting, in most localities, when used for firewood. These will average some six or eight inches at the butt, are smooth, and when growing in clusters are quite tall. The limbs project in joints around the tree, leaving a space between them of from 12 to 24 inches of perfect stock. These trees are now cut for paper stock, and trunks, limbs, bark and the needle-like leaves are all worked up by mechanical and chemical processes into roofing and other paper and paste board. It is said that the saving of the limbs and the bark of the tree now pays for the whole cost of the wood.

THE carpenters of the Northern Pacific railroad are building woodsheds in Idaho in order to have sufficient dry wood for the locomotives. The shed at Sand Point is 200 feet long by 75 feet wide and those at Camp Hope, Cabinet, Gravel Pitt 3, Rock Island, Trout and Beaver creeks are 30 by 150 feet. The wood to fill these sheds is already out.

THE Aztecs, before the conquest of Mexico by the Spaniards, recognized the value of trees to a country for the maintenance of moisture and the promotion of irrigation. Prescott, in his history, tel's us that their law contained seven penalties against the destruction of the woods, which they deemed necessary to secure the means of maintaining irrigating canals.

THE Buffalo *Lumber World* says :—From the logging camps tbe news is generally favourable. In some sections an extra good start was secured, and everywhere the beginning was satisfactory. The soft spell of the week before December rather discouraged some, but since that time it has become much colder again and work is progressing rapidly. The profitable condition of lumber manufacturing during the last season encourages the belief that a very large supply of logs will be banked—perhaps larger than ever before, if conditions continue favourable.

Lumber Sale.

Mr. J. M. Irwin's auction sale of lumber at Nassau Mills on Wednesday was very successful, the large quantity offered being readily purchased at satisfactory prices. The competition was keen, there being several buyers from a distance, besides our local builders and farmers, so the auctioneer Mr. C. Stapleton, was kep busy with the bids.

THE *Timber Trades Journal* says :—The Germans appear determined that we shall not be helped by them to ruin our forests. A proposition has been laid before the German Senate to increase the duty on imported unmanufactured wood from 10 to 30 pfnnige per 100 kilogram, and from 15 to 25 pfennige for sawn wood !

FORTUNATELY Valvular disease of the heart is not very common, its disturbed action may be due to indigestion, liver irregularities &c. A Stomach disturbed with wind, or indigestable food will cause pain and fluttering by crowding on the nerves of the heart. Burdock Blood Bitters will speedily remedy all such difficulties.

TIMBER CLAIM LAW.

An Iowa correspondent wrote to the Chicago *Lumber Trade Journal* as follows:—I think few of us realize the benefit of this law. Those who settled far out in our prairies twenty to forty years ago, when there was no trees for miles around to break the bleak winds, can now since trees have been planted and grown twenty to forty feet high, realize their benefit in breaking the wind, Far more will the settlers of the broader treeless countries to the west and north west be benefitted by the Timber Claim Law, which will induce so general and extensive planting of timber. Whether forests do or do not induce rain I will not here stop to argue, but it certain that when the wind is checked the dews fall more and last longer in the morning; the evaporation of moisture from the soil is less; the wind does not dry up, injure and break down the field crops; nor does the winter wind so terribly pierce both man and beast when trees planted as when the long reaching winds meet with no barrier to check them.

Wood and timber is a proper and valuable product of the farm, and the young beginner on the farm will find, if he plants valuable and fast growing varieties, the grove will be the most valuable investment on his farm.

Winter and spring is too late to gather the seed and nuts of most of our forest trees, but the cuttings of cottonwood and willow should be taken off very early, before the sap begins to circulate, and stored where they will keep slightly moist. I do not recommend these trees as being valuable, except for quick growth and easy to be had for next spring.

The nurserymen have large quantities of walnut, maple, ash, hardy catalpa, etc., which may be had by applying before their stocks are all sold, but the demand is very great, mostly sold out last fall. The catalpa has been raised by the million and sold for planting in Kansas, Nebraska, Iowa, and some in Dakota and Minnesota; but its success north of Iowa is yet in doubt. I would recommend its trial in the middle of groves of other trees, with deep planting on dry land. Wherever it can be raised it will certainly be the most valuable tree for the farmer.

When Congress passed the Timber Claim Law it was a wise provision and a great incentive for the settlement of new territories. They will soon become new states, and changed in a wonderful short time into comfortable homes with prosperous farmers.

JOINERY FOR ENGLAND.

The *Timber Trades Journal* says:—We have further information to hand respecting the coming importation of prepared American joinery, or more correctly termed "finished wood-work." Great efforts, it is said, will be made next season to establish "American finished wood-work," as a saleable item in the English markets.

The same journal also says:—Messrs. Ekman of Stockholm, the firm from which Messrs. H. Atkinson & Co., of Wharf Road, London, receive their supplies of Swedish joinery, are, we understand, in order to meet an increasing demand for their doors and other goods, about to make considerable additions to their mills. This firm were the pioneers of the Swedish joinery trade in this market, and the uniform excellence and reliability of their goods are too well known to our readers to need any further commendation from us.

RENDERING WOOD INCOMBUSTIBLE.

Accounts are published in the English scientific journals of some recent tests of asbestos mixtures for rendering wood, canvas and other materials incombustible, and it would seem, with encouraging results. Among other experiments, a piece of light pine wood, about six inches long by four inches square, painted with five coats of this substance, was placed for upwards of half an hour in an ordinary grate fire, but, although the wood within was reduced to charcoal, there was no blaze whatever emitted during the charring. Again, a small model theatre, built of wood, with net scenes and accessories, was sprinkled with turpentine and set on fire, every portion ignited, and the whole was consumed; but a similar model with the net scenes and the wood frame all painted with abestos, was drenched with turpentine and set fire to, but the scenes were only partially charred at the lower ends, with the turpentine flames, while the timbering was not even ignited. Tests were also made with two models of a larger size, about four feet cube built on a bed plate of one inch real board, and set fire to by a bundle of shavings, the one was burned and the bed plate set on fire, while, in the other no ignition was effected in the parts to which asbestos has been applied.

THE GATINEAU FORESTS.

A reporter of the Montreal *Star*, in a description of the Gatineau Valley says:—"The existing forests of the Gatineau districts are as nothing in comparison to the original ones, the lumber trade or bush fires having swept off most of the huge pines which lorded over the country when Canada was discovered. They are for the most part composed of hardwood, varying in size according to the date at which the country they stand on was cleared of pine. Most of the uncultivated country is covered thickly with maple, oak, birch, elm, beech and other hard woods, which are used as fuel, and the Gatineau railway when built will be able to bring out enough cordwood from this district to alone make it a promising investment. Again there are large quantities of valuable butternut and ash, almost invaluable through its size for the manufacture of furniture and carriages, which is at present being wasted, but for which there will, undoubtedly, be an unlimited demand as soon as it is within reach of the outer world. In the moist places cedar grows in abundance, while spruce and hemlock are very often met with."

NORWAY.

The Christiana correspondent of the *Timber Trades Journal* writing on Dec. 11th, says:—We have now had thorough winter for about a month, and, notwithstanding many prognostications to the contrary, it seems to have settled down for good. A fair quantity of snow having fallen, the transport of logs from the forests will be as easy as can be, and this year's crop of hay having been abundant, the hire of horses is likely to be cheap. Under these circumstances it would seem probable that a great quantity of timber could not fail to be brought forward for next year's sawing season. However, much will depend upon the prices, which have yet to be fixed. As the peasants have had a pretty good harvest, they will be independent; and on the other hand, shippers are not likely to go in for allowing last years rates, the same having given little or no profit, and prospects on your side not being particularly bright. It is likely, therefore, that the favourable state of the "winter roads" will not be taken advantage of to the extent that it might have been under other circumstances.

SPRUCE IN ENGLAND.

The *Timber Trades Journal* of Dec. 23, says: The heavy and somewhat sudden arrivals of spruce deals in Liverpool have had the effect of bringing down prices. Sales have been made during the week at reduced figures, and we hear of orders having been booked in the country at £7 5s. ex quay. The fall may, however, prove to be only of momentary nature, and it is quite possible that prices may rebound when the bulk of the wood ex quay has been dealt with.

Spruce deals have been offered at reduced figures, and sellers have displayed some anxiety to rid themselves of stock. Why holders of spruce should be unduly anxious to take orders is not quite clear. The demand for wood in those districts where spruce is most largely used is certainly now as good as it was during the corresponding period of last year, and there exists every likelihood that a steady demand will continue during the early spring months,

FOREST PROTECTION.

If our law makers throughout the country represented with anything like faithfulness the awakened interest of the most intelligent part of their constituents, says the New York *Tribune*, the coming winter would not pass without some efficient legislative action, state and national, in the matter of forest protection. Special enactments are needed in different states to meet the dangers which threaten in each. In the lake region laws to protect the remaining pineries from fires should be passed at once. In the south where forests are preyed upon by browsing animals, as well as by fire, and devastated by the wasteful production of turpentine, legislation of another sort is demanded. The first duty of our own legislature is to protect the Adirondack woods from further invasion. In California the imminent danger is from mountain torrents, and the state government should co operate with the federal government to preserve the forests about the fountains of the streams which head on the western slopes of the Sierras.—*Lumberman's Gazette.*

A Satisfactory Test.

A test of Mr. Hubert's new fire-proofing material, which is intended to take the place of iron beams in constructing fire-proof buildings, took place lately at Schillinger's stone yard at 92nd street and avenue A., New York city. The material consists of coal ashes and plaster paris moulded into strips one and one-half inches thick. A large oven built of this combination was erected in the yard. The top of the oven was coated with the fire-proofing, so as to represent the ceiling of a room, and above which there were a number of wooden beams, around which were nailed strips of the same material, these being surmounted by a wooden floor. At 2.30 p.m. a fire was started in the oven and allowed to continue to burn fiercely for an hour and a half. The fire was then extinquished with water and it was found that the floor was scarcely warm, while a beam that was directly across the flue was only slightly charred and a very small piece of the ceiling of the oven had fallen. It is claimed that iron beams would not have stood so severe a test in such a satisfactory manner and that the cost of this method of fire-proofing, will be about 33 per cent of that now employed.

Muskegon Enterprise.

The *Lumberman's Gazette*, of Bay City, Michigan, says:—The late trip of the Muskegon lumbermen is fraught with great significance especially in Chicago, the most important lumber distribution centre in the west, and in fact in the world, it being virtually without a rival in the amount of lumber handled, the entire product of the Saginaw Valley being insufficient to supply more than half its needs. The Muskegon *Chronicle* in alluding to the movement just inaugurated to effect a scheme for the handling of Muskegon lumber product at that point direct, says: The *Northwestern Lumberman* represents the Chicago dealers as calculated on how low a price they can offer our mill men for the lumber now cross-piled on the docks. They should save themselves this trouble, for Muskegon intends henceforth to dispense altogether with the services of Chicago dealers.

The Manchester Canal.

The Manchester City Council have confirmed the report of the sub-committee appointed to inquire into the feasibility and desirability of of the Ship Canal Scheme. The sub-committee, it will be borne in mind, submitted a highly favourable report. A member of a leading Liverpool house of timber importers has publicly expressed the opinion that the Ship Canal will not materially damage the wood trade at Liverpool. It has been resolved to seek the sanction of Parliament for the scheme to be subscribed to out of the rates. Incidentally it was mentioned that a million pounds would be a fitting sum to subscribe. The project has not been well entertained by the Manchester press. —*Timber Trades Journal.*

HOOPER & CLARK, pump manufacturers at Lewiston, Me., in connection with a gentleman of Portland, have purchased 3,000 acres of timber land, and will cut spruce and hardwood lumber. Their portable saw mill will be discarded for a permanent one of respectable capacity, which will be driven by 120-horse power engine, and built in the woods. A wooden tramway several miles in extent has been laid, on which cars are now running. The lumber will be shipped from Philips, distant 10 miles from the mill.

17 YEARS' EXPERIENCE.

HOWIE'S DETECTIVE AGENCY

OFFICES, 32 KING STREET EAST,

TORONTO ONT.

All legitimate Detective business attended to for Banks, Fire and Life Insurance Co's, also for private parties. This agency does not operate for reward. 1yL5

PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

FUEL FOR THE FUTURE.

It is not now thought that the electric light will come into serious competition with gas, or even oil, for some time to come. As a result of this conviction gas shares are now going up, both in Europe and America. Mineral oils are likely to share in this improvement. A factory in Mayence (Germany) lately installed gas works, not only for illuminating, but also for heating and manufacturing purposes. The gas, which is made from mineral oils from Weissenfels, is purified by using a mixture of two parts of saw dust and one part of flour of sulphur, to which a small portion of slackened lime is added. A saturated solution of sulphate of iron is then poured over. The composition can be used for three operation if the mixture is stirred. It is claimed that 50 kilos of the Weissenfels oil has as great power as 75 kilos of Scotch mineral oils. Be this as it may, there is little doubt that gas will be a popular fuel of the future, both for heating and cooking purposes. The gas stove is rapidly finding its way into Canadian households. In this city at present there are nearly two hundred coal oil stoves in use, and said to be giving good satisfaction. Between oil and gas stoves and the more extended methods of heating and cooking by steam, the solution of the question of cheap fuel is not far off.—*London Free Press.*

Timber Limits in Muskoka and Parry Sound.

Mr. Meredith inquired in the Ontario Legislature on Thursday, (1) what rates of dues were prescribed by the conditions of sale of the 487 square miles of timber limit in the Parry Sound and Muskoka districts sold in 1881; (2) whether a reduction has been made in the amount of such dues, and, if so, to what extent and during what years; (3) whether any order-in-Council was passed authorizing such reduction, and the data of such order-in-Council, if any.

Mr. Pardee said the original dues were $1.50 per 1,000. They had been reduced to the uniform rate of 75 cents, the reduction being made by order-in-Council on Nov. 20, 1876, it being ratified by the House during the following session.

Importance of Timber Culture.

The New-York *Tribune* says :—The appointment yesterday of two commissioners in Vermont, to enquire into the condition of the forests of that state and to recommend such measures as may be needed for their protection, is a step in the right direction. The forests of the eastern states are daily becoming more valuable as the western pineries disappear, and there are thousands of acres of poor land in New England and elsewhere, not available for ordinary farming, where, with a little encouragement from the State Legislatures, timber culture might be made to pay. Vermont has not appointed her commissioners a day too soon.

Second Growth Pine.

According to Professor Sargeant, of Harvard College, Michigan and Wisconsin will some day find rivals in Massachusetts and other New England states in the production of white pine, which is a second growth in those states. The product sawed in Massachusetts in 1880 was worth $1,000,000. Vermont and New Hampshire produced 100,000,000 feet, and Maine as much more. This, of course, to a Michigan or Wisconsin lumberman of to-day, is a trifling affair, but in the future, when the pine resources of this region are exhausted, it may seem quite important.

Consumption Cured.

An old physician, retired from active practice having had placed in his hands by an East Indiana Missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for General Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it is his duty to make it known to his fellows. The recipe, with full particulars, directions for preparation and use, and all necessary advice and instructions for successful treatment at your own home, will be received by you by return mail, free of charge, by addressing with stamp or stamped self addressed envelope to

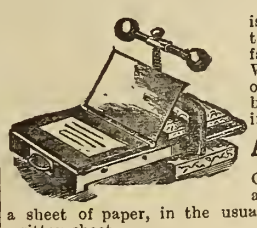
ZUCCATO'S PAPYROGRAPH



is a new invention for the rapid production of fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.

Autograph Letters

Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet

500 COPIES PER HOUR

may be printed upon any kind of dry paper, or other material, in a common Copying Press.

This is the Most Simple, Rapid and Economical Process yet Discovered.

THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.

The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.

For specimens of work, price-list, etc., address with stamp.

THE PAPYROGRAPH CO.,
43 and 45 Shetucket Street, Norwich, Conn.

LOCAL AGENTS WANTED.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. w46d112L22

Lumber Merchants.

EMERY WHEELS FOR SAW GUMMING.

EX INUTILI UTILITAS — TRADE TANITE MARK

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

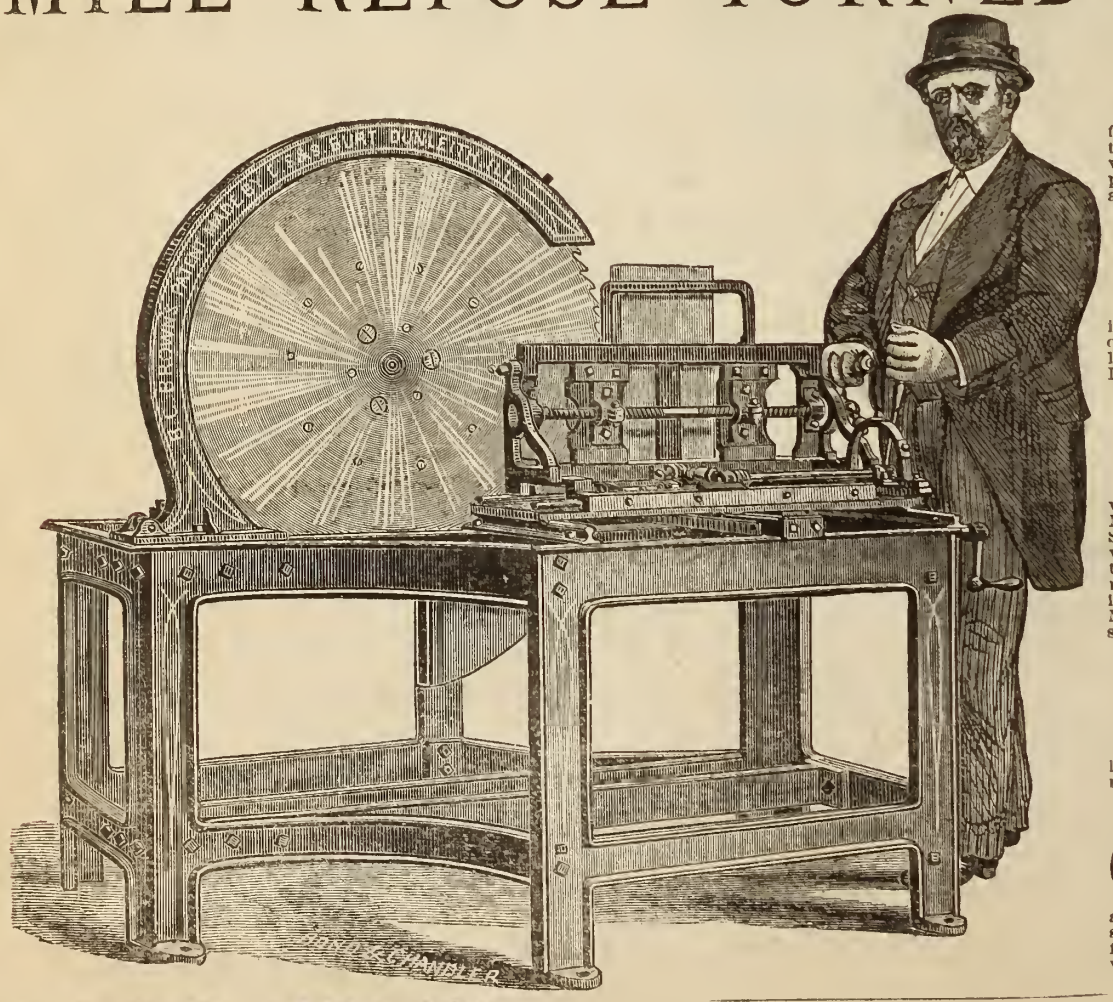
MILL REFUSE TURNED INTO MONEY



BY THE USE OF

Brown's Patent Spalt and Shingle Mill,

for making Shingles, Barrel Heading, Box Stuff, &c., from spalts, board trimmings, slabs, and mill waste generally, turning material otherwise worthless into valuable products. I have made arrangements with the patentee to manufacture and sell for the Dominion; have made and sold a good number of these machines which are giving excellent satisfaction and can give the best of references.

Our Steam Feed for Circular Mills,

is now the Best Feed where Steam is the motive power. It is easily operated, is simple, rapid, and seems never likely to wear out; sixteen 16 ft. boards, or eighteen 12 ft. boards, have been cut by it in one minute It is the established feed for steam mills; I make a specialty of its manufacture; will guarantee satisfaction.

Our Patent Twin or Span Circular,

with Steam Feed for Steam Mills, and Rope or Rack Feed for Water Mills is fast coming into general estimation and is used in place of Gang Slabber in our best Canadian Mills. One of our Span Circulars which will slab logs 25 inches in diameter down to 7 and 8 inch stocks, will do the work of three slabbers, with an immense reduction in first cost, running expenses and labour. Two of these machines can be seen at work in Messrs. Gilmour & Co's Mill, Trenton, and Georgian Bay Lumber Co's Mill, Waubaushene and Port Severn. ☞I am also introducing a new style of Mill Engine, neat, substantial and simple, with Corliss Frame and Balanced Valve, all carefully designed and honestly made.

Covel's Automatic Saw Sharpener,

is now well-known and highly appreciated, when placed at work in the mill it slugs out its own praise; I keep it constantly on hand, ready for immediate shipment.

Our Standard Circular & Gang Mills & Machinery,

are too well known to need any reference, any further than to say that I spare no pains or expense to have my work all first-class and give satisfaction, and as I make Heavy Saw Mill Machinery a specialty, any party wanting a First-class Mill will find it to their advantage to give me a call.

WILLIAM HAMILTON, Peterborough Foundry and Machine Works, **PETERBOROUGH Ont.**

THE CANADA LUMBERMAN

AND MILLERS' MANUFACTURERS AND MINERS GAZETTE.

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

SUBSCRIPTION $2.00 PER ANNUM.

VOL. 3. PETERBOROUGH, ONT., FEBRUARY 1, 1883. NO. 3.

It is said that a firm dealing in walnut lumber at Jacksonville, Ill., recently secured a stump near Wayland, Mo., that weighed 3,636 pounds for which they were offered 11 cents a pound, or $333,96, but the firm was holding it for 15 cents a pound.

The Portland Fiber Ware Company, of Brunswick, Me., has formulated a varnish most valuable for use on woodenware. One of the important accomplishments promised is to make shingles practically indestructible by coating with this varnish, and a variety of articles will be rendered durable and serviceable by that means.

A correspondent writes to the *Timber Trades Journal*:—There have been few, if any, really good years since 1873, and our Swedish friends were actually obtaining last spring better prices than they did in January, 1873. The question is, Can this last? I think not. General trade here is far from satisfactory. No doubt the volume of business is large, but the results are in too many instances very small. On the other hand, immense profits have of late years been made in the trade in Sweden. The result is a large increase of saw-mills and speculations in wood. These, combined with the recent development of railways, so often referred to in your *Journal*, point to an increase in the supply. Under these circumstances prices *should* reach a lower level, and in my opinion *will*. If they do so it will eventually be better for all concerned.

CYPRESS WOOD AND LUMBER.

The products of the immense cypress forests of the south are slowly but surely finding a market, and in no very long time the demand for the excellent lumber and unrivaled shingles made from this wood will be difficult to fill. It is stated that when the saw mills at Beaumont and Orange, Texas, began manufacturing cypress lumber they found very little demand for it, but they have since quadrupled their production, and find an easy market for all they can saw. This lumber is just beginning to be introduced into the northern markets, and its advantages are now acknowledged. The wood is fine grained. After exposure to the air it becomes a dim redish color. It possesses great strength and elasticity, and is lighter and less resinous than the wood of the pines. To these properties is added the faculty of long resistence to the heat and moisture of a southern climate. The color of the bark and properties of the wood vary with the nature of the soil. Trees growing near the natural bed of rivers, and surrounded half the year with water to the height of three or four feet, have a lighter-colored bark than those standing where water does not reach them, and the wood is whiter, less resinous and lighter. These are called white cypress. The others are darker and so called red cypress. This truly excellent wood is now used for various purposes, and there is an increasing inquiry for it. Boat builders use it to a considerable extent. Many of the small boats belonging to the men-of-war of the United States service are constructed of cypress; much is used for water tanks, sugar coolers and cisterns, on account of its durability; some enters into the construction of houses and house finishing, it being excellent in ceiling, and large quantities are made into shingles and cross-ties. The Lehigh Valley railroad company ordered 75,000 of these ties to be used upon its road this season. In some instances the shingles are manufactured with the large end finished round and octagonal that the roof may present a finer appearance. These kinds are used upon churches in the rural districts and upon villas where the builders wish to display some taste in lines that vary from the ancient straight and conventional methods. Some claim that shingles, properly prepared, will last 100 years. They are certainly very durable. Wood taken from submerged swamps which has been in contact with the decaying influence of mud and water for untold centuries, is found to be in an excellent state of preservation. Cypress logs have been taken from the soil deep underneath New Orleans in good condition. Evidences are abundant and conclusive in regard to the lasting properties of the wood. Hence, it is gradually creeping into use more and more each year. Already it is being used in many houses in New York city in finishing, with calls for more. Five million shingles is the estimated amount of consumption in the New York market, with an increasing demand. At least 4,000,000 feet of the wood will be required to supply the market in railroad ties the coming year, and about 2,000,000 feet of lumber for general use. It is exported to some extent to various ports. Railroad ties have been sent to Cuba, France and England. Lumber has been sent abroad, but in no great quantities.—*Lumberman's Gazette.*

THE PINE BELT OF THE SOUTH.

A correspondent writes from Brainbridge, Ga., to the *Northwestern Lumberman* as follows: Until the extent of the great pine forests of Michigan and Wisconsin was thoroughly known, but little attention was paid to the timber supply of the south Atlantic and Gulf coasts. Other causes, not necessary to mention here, united in this overlooking of the finest belt of yellow pine in the world; now, however, when the timber supply of the Northwest is being lessened, the advantages offered by the South, in the way of timber resources, is attracting attention.

The yellow pine region of the south presents some peculiar features which I will briefly notice: Beginning in North Carolina, it stretches back to the hills which mark the ending of the Apalachian chain of mountains, a distance varying from 100 to 200 miles, and extends along the Atlantic seaboard and the Gulf coast westward, till the valley of the Mississippi is reached. The width of the belt is nowhere greater than 200 nor less than 100, and its length is 1,000 miles approximately. For an average distance of 50 miles from the seaboard the land is low and marshy, with stagnant ponds on every hand, and the lumber of inferior quality. A gradual ascent is then begun till an altitude of 300 feet above tidewater is reached. At this altitude the finest timber is found.

A few leading questions present themselves to those looking for timber lands—quality of timber, and quantity as well, price of lands, and accessibility to transportation. These questions I can answer, so far as this section of Georgia is concerned.

Decatur county has an area of 1,500 square miles, and it is safe to say that there is in the limits of the county 500,000 acres of virgin pine forests. In addition to the local supply, Flint river traverses near its centre from north to south, and for 100 miles runs through unbroken forests of pine, while on the west side of the county is the Chattahoochee river, which also runs through a section well supplied with timber. So much for quantity, and quality is of the very best.

Timber lands vary in price from $1 to $2 per acre, owing to location, and are abundant at the prices.

What I have already said of the Flint and Chattahoochee rivers will give an idea of their availability for transportation of lumber and timber. These rivers are navigable for large steamers the year round, and there are no obstructions in the way of rafts. They unite and flow into the Gulf of Mexico at Apalachicola, Florida, which has a harbor admitting vessels of 10 feet draft. The government is now improving the bar off the harbor, and vessels drawing 14 feet will be able to load at the wharves.

In addition to the river transportation, direct railroad communication is had with Savannah, and lumber can be placed on shipboard there at a cost of $4 per thousand.

Timber lands at the prices I have mentioned are not more than three miles from river or railroad, and thousands of acres can be bought on river and railroad at the figures named.

In the way of health, water and such incidental advantages, the country offers superior inducements—the climate is healthful and mild and water abundant.

CANADIAN TIES FOR FRENCH RAILWAYS.

The visit of M. le Chevalier Drolet to France has been fraught with much interest to the Dominion generally, and the lumber trade in particular. Mr. Drolet went over to Paris for the purpose of bringing prominently before the French Government the superior quality of Canadian timber, more especially as regarded its transformation into railway ties and sleepers. Mr. Drolet took over with him several samples of tamarac railway ties, in order that the French Government, in their immense railway schemes, in which they expected to be able to use some six millions of ties per year, might have a portion of this immense demand satisfactorily and profitably supplied from Canada. The forests which have hitherto been drawn upon for sleepers lie on the shores of the Baltic, in Danubian principalities and in Italy. The samples in question, from Canada, were shown by the Chevalier to M. Herrisson, Minister of Pubic Works, who was much pleased with them. A series of tests were ordered to be applied to the samples, and much curiosity was felt amongst those interested as to what strain the new timber would stand, as the tamarac is not indigenous to France. The experiments took place at the Ponts-Chaussees, Paris, about the end of November, and under the supervision of M. Durandeleye, chief engineer of the institution. The tests consisted of severe traction and crushing, and also large screws were inserted into the ties and then pulled forcibly out, in order to show the amount of resistance of the grain of the wood. The tests were pronounced satisfactory, and Mr. Drolet was on the point of signing a contract to deliver 7000,000 ties. At this critical juncture Mr, Leon Say's celebrated article on Finance appeared in the *Journal des Debats*, in which that statesman counselled the Government to practise the strictest economy. It was stated that the railway scheme, which under the de Freycinet Government would have only cost four millards of francs, would now cost eleven milliards. The result of this article was that the Government abandoned for the present the construction of the railways, and the Minister of Public Works informed Mr. Drolet that the question of the contract would have to be postponed until next June, when the work wonld doubtless recommence.

"The question now is," says Mr. Drolet, "whether the French Government will continue the railways, or hand them over to the great companies. In any case, we are sure of a market, as some of the tests were made by the Chemin de Fer de L'Ouest, and somewhat surprised them. I was compelled to decline a contract to deliver 370,000 ties at Bayonne to be used in the construction of a railroad in the north of Spain, on account of the lateness of the season. The ties used in France are longer and thicker than those used here, and are required to be sawed on four sides. When the contract is signed the French Government will have agents on this side to receive and stamp the ties and afterwards ship them. This, of itself, will be of considerable advantage to the city."—*Montreal Star.*

PRESERVATION PROCESSES.

The are several solutions to the timber denudation problem. To start with, it is much more a scare than a reality. That everbody has a chance to know that white pine and other woods are annually manufactured and consumed to an enormons extent is not doubted, as well as that the rate of utilization has latterly increased. But there are several reasons why the period of actual exhaustion is much farther distant than much of the popular noise on the subject would indicate. That result is, in fact, so far ahead of present calculations that it need trouble this generation very little, unless its faith in Providence is gone, or it has an unnecessary solicitude for posterity. One important fact is that the supply remaining is by no means so microscopic, comparatively, as interested or ignorant figurers have asserted, a point which the *Lumberman* has for some time been insisting upon, particularly with regard to the white pine of the North. The fact, also, that substitutes can be employed when wood is not obtainable is being currently and practically demonstrated; the possibilities in that direction having been repeatedly discussed. A further potent factor which will figure is a tendency, both necessary and economical, to temper and reduce the volume of consumption. Before it becomes positively demanded that no wood shall be employed for certain purposes, because of the lack of it, the enterprise affected will have already developed a way of supplying wants with other material, and of making those which are used more enduring. There are a great many possibilities that have not been worked out, many scientific questions of which merely the surface has been brushed, and numerous future developments of great import may be counted on of which nothing whatever is dreamed now. If this should not be so, then abstract science must have reached a standstill, and science is so restless it will never be open to that indictment.

No doubt one of the most momentuous points involved is the question of the durability of wood, and the means whereby it may be increased. It makes a vital difference in dollars and cents, as well as in the question of supply, whether a piece of timber will last 10 or 20 years. By having its power of existence extended it not only obviates the purchase of new material, but a more or less heavy expense, many times, in the general reorganization of a structure. Very often a process of timber preserving will cost about as much as the wood itself, which is no object provided it brings assurance of permanence and strength in the materials employed, and hence the structure itself. Such processes, while making the qualities of the raw material available to the greatest possible extent, may also bring into a more practical field certain woods regarded inferior on account of lacking the virtue of endurance, making possible the use of a greater variety of timber for certain special purposes, and somewhat checking a tendency to sweep away and appropriate to a number of purposes the cream of the timber, to leave standing large amounts of other kinds considered of little account or worthless.

A great deal has been said, from time to time, on the subject of preserving timber, but not enough that was definite. The more that is known in this direction, the better for the industries of the country generally. A committee of the American Society of Civil Engineers has spent a large amount of time and effort in collecting from all possible sources the results of experiments and actual experience in this line, which necessarily must cover a series of years. In its researches the committee met with many obstacles in the way of arriving definitely at the facts. The records of experiments which had been carried to the proper extent regarding time were often insufficient on the subject of detail, and the precise methods of accomplishing results, where the latter were stated. Out of information regarding 88 experiments, the oldest dates back to 1839, and pertains to the building of Fort Ontario, at Oswego. The processes mainly touched on are kyanizing, burnettizing and creosoting. In the case mentioned the first process was adopted. In the revetments of earthworks 92,000 cubic feet of 12x12 and 6x12 timber was used, with some smaller, all of which was immersed in a solution of one pound of corrosive sublimate to 15 gallons of water, for from 14 to 21 days, the cost being about $6 per thousand feet—about the cost of the timber. Hemlock was mainly used, with some basswood, beech and maple. The work was completed in 1843, and it is reported that an inspection in 1882 showed nine-tenths of the shorter timber still standing, while two-fifths of the upper halves of the larger timbers, with their cap timbers, were yet in position. Out of 100 standing timbers, whose lower ends were below the surface, 60 seemed entirely sound, except for about six feet from the surface upwards, the remaining 40 being more or less rotten throughout the length. The sides of the timbers towards the earth in the rear seemed as sound as where exposed to the air. Much of the other hemlock timber was sound, the beech and maple having rotted, with the exception of a slight shell. In one case at Lowell, kyanizing was rejected for burnettizing (saturating with chloride of zinc), and the latter being found less effective, the first means was repeated with very satisfactory results. In 1856 the Central Vermont railroad established works for saturating timber with chloride of zinc under pressure, a similar process being now in operation in Germany. The plant was in use four years, when it was abandoned because of the excessive labor and time required to prepare large quantities of heavy timber. The burnettized hemlock ties were inspected however, and found in a sound condition after 25 years' use.

The Chicago, Rock Island & Pacific road, in 1866, laid 2,000 burnettized hemlock, pine, tamarac and cedar ties in the main track west of Englewood, within a few miles of Chicago, and under a heavy traffic. The ties were mainly hemlock, and after 15 years' service three-fourths of them was still in the track, and good for three or four years more. Those taken out were sound and solid in the centre, and decayed only one-half or three quarters of an inch deep on the surfaoe. The rails had worn into the hemlock no more than they would into oak. The tamarac lasted about equal to the oak, while the pine and cedar had disappeared. The hemlock, when untreated, this road find to first decay in the centre. In 1872 this road laid 5,000 creosoted ties in a second track near Chicago, but they are not believed to have been thoroughly treated. They were sound on the bottom when examined in 1882, and badly decayed on the surface, and were cut by the rails more than the burnettized hemlock ties. What ties remain will probably be removed in the summer. The same authority places the life of untreated hemlock ties in sand or gravel ballast at not more than five years, a thorough treatment with chloride of zinc making them last 15 years. The same road erected a Howe truss bridge of burnettized timber, 150 feet spans, in 1860, which it was intended to rebuild in 1882, and which is still in fair condition.

The New Orleans & Mobile road has found that the indefatigable boring genius, the toredo, will not attack creosoted timber.

The Houston & Texas Central road is stated to be the only road in the coudtry now having a plant for preserving timber. It removes sap by applying super-heated steam and injecting dead oil under pressure, and within two years has treated about 150,000 cross ties, of a short-leaved Texas pine, which ordinarily lasts only about two years, being so porous that, when thoroughly seasoned, it will absorb over two gallons of oil to the cubic foot. About five gallons to a tie is generally used, which is insufficient to thoroughly saturate them. They were found perfectly sound after seven years' use, except in parts where the oil had not penetrated. The timber is hardened by the treatment, and does not show any serious wear.

The most of the evidence is in favor of hemlock, which, by treatment, can be made superior to untreated oak, while many absolntely worthless woods may be rendered valuable. The result will gradually lead to the more extensive use of hemlock, which will have an enhanced commercial vale. Of course the idea of treating timber, as the experiments show, is nothing new, but it is by no means as generally in practice as it might profitably be placed, nor the processes so thoroughly understood as they should be. While one treatment may be superior for one kind of wood, another process, possibly unknown, may be needed for a different wood, the durability of which might thus be increased as greatly proportionately as in the cases cited. There is, at least plenty of hemlock, which can be utilized to good advantage. In some sections the ties are conveyed such long distance, owing to the absence of suitable timber in the vicinity, as to make the expense border on the enormous, which might not be so if the idea of a proper treatment of the wood was more generally carried out. Besides the financially practical features the subject presents, the preserving processes will do much toward husbanding present supplies. Moreover, the experimenters, as may be seen, are beginning to learn better what may be done.—*Northwestern Lumberman.*

THE LUMBER SITUATION.

We take the following from the lumber review in the Montreal *Journal of Commerce* on the lumber trade for the past year, and the situation at the close of it:—

Although the English markets show signs of considerable improvement, which it is to be hoped may continue, we cannot refrain from expressing the belief—the result of observations for the last few seasons—that ere many years wood products will be more valuable at this side than in Europe. The enormous consumption going on, especially in the United States and Canada, cannot fail of this effect. The requirements for home consumption in the older provinces are every year increasing, while Manitoba and the North-West are only beginning to indicate their wants. The shipments to these new customers from Canada and the United States during the past year were over 100 million feet B. M., and these must go on increasing as the territory is colonized. It is probable that at no very distant date but very little of the products of our forests will be shipped to the European markets, excepting, perhaps, those kinds for which other North of Europe goods cannot be substituted, such as first-class white pine timber and deals, white oak of large size, and probably hardwoods and pitch pine from the United States ports. Lower grades of pine and spruce will find better prices on this side than English markets can afford, as long as they possess cheaper substitutes from Norway and Sweden. This change is now going on, as far at least as Quebec is concerned, as evidenced by the gradual decrease in exports shown by the following clearances from Quebec for the last nine years:—

	Vessels.	*Tons.*
1874	854	636,672
1875	642	478,411
1876	786	624,110
1877	796	670,627
1878	476	399,833
1879	433	364,628
1880	634	555,451
1881	459	380,186
1882	426	359,925

And the prospects are for a still further decrease in 1883. This may be clearly ascribed to the large supplies from North Europe at low prices, while our American markets will absorb any probable or possible production at relatively higher prices than European market will pay.

Wintering stocks are a trifle greater than last year, but yet considerably lower than in former seasons. Prices have ranged during the season about as follows:—

	1st. Qual.	*2nd Qual.*	*3rd Qual.*
White pine deals	$104 to $112	$68 to $72	$36 to $39
Spruce deals	$ 38 to $ 40	$26 to $28	$23 to $6

All these are per Quebec standard (2,750 feet) ex quay, mill cutting and mill specification.

Timber, white pine in raft	20 to	$5
" red "	15 to	25
" oak in dram	45 to	50
" birch	20 to	25
Staves, pipes	$3.75 to	$3.90
" puncheons	90.00 to	100.00

Freights ruled about as follows:—

	Timber	*Deals.*
Opening at	23 to 25c.	60 to 65c.
Closing at	30 to 35c.	70 to 80c.

Operations in the woods for the coming season in Canada are on an increased scale for the United States markets, and on a reduced scale for European markets. The weather thus far has been all that could be desired; there is at present, however, some appearance as though operations would be hampered by too much snow. This, however, is only one of the many ordinary incidents of lumbering; everything is high in price, pork unusually so; labor is also abnormally high; in fact, in this district it is not a question of wages at all, it being absolutely impossible to get a regular supply of work men for the woods. Large numbers have been lured away to the Michigan and Maine forests at high wages through the efforts of hiring agents who have scoured the province from one to the other.

We hear of few or no sales of new mill cuttings for next season; manufacturers are holding for stiff prices, and exporters are waiting to see how the English markets may develop during the coming months. But these last remarks refer to deals only; we understand that some contracts have been made for Michigan and Ohio oak timber and waney square pine at probably a slight trifle advance on the prices of last year. We can never expect to see the two latter classes of timber at old prices again, for while the supply is diminishing every year, the demand on the other hand is increasing.

SECOND GROWTH PINE.

An interesting paper by Mr. Edward Jack, of New Brunswick, appears in the St. John *Telegraph*. Our readers should ponder, as it contains some valuable hints relating to the second growth of pine. Mr. Jack is an authority on the subject, and his remarks carry a good deal of weight. He says:—

"A few weeks since, just after the railway cars in which I was riding had passed through the Hoosac Tunnel, the news agent handed me a copy of the Springfield *Republican* of December 9th. As I glanced over it my eye fell upon this passage:

"'The second growth of white pine sawed in Massachusetts, census year, was worth about $1,000,000.'"

"This was an extract from a paper lately read at the State Board of Agriculture in Northampton by Prof. Sargent, of Harvard College. The Professor says that 'a large portion of the neglected farming lands in Central and Southern New England is growing up to white pine,' and could that growth be encouraged and protected, Prof. Sargent sanguinely predicts that its value in Massachusetts, alone, would in a few years exceed the net profits upon half a century of farm crops.

"This statement attracted my attention so much that I made it my business, for the rest of the journey through this part of Massachusetts, to notice every grove of second growth pine, as well as every board pile visible from the car windows. The numerous piles of pine board which met my view, as we passed along, were with but few exceptions, sawn from small second growth trees. What I saw convinced me that if Massachusetts could make large profits out of second growth pine, New Brunswick could do the same.

"One-third of our Province is embraced within the limits of the grey sandstone of the Coal Measures, the meagerness of whose soil is so well described by Prof. Johnston, in his Report on New Brunswick. This soil, although suitable to the growth of little else, is well adapted to that of the White and Norway pine, and clumps and groves of these woods are now springing up all over the burned lands of these districts. Indeed many a good pine log has been cut in New Brunswick on ground swept by the Miramichi fire. Looking across the Nashwaak from the highway near the dam, at Mr. Gibson's mills, one sees on the south side of the river a growth of stout sapling pine, which will soon be fit for timber. It is not many years since the land on which these trees are growing was under crop, and did others exercise the same care that Mr. Gibson has done, in this case, the benefits to accrue to the country would be immense.

"It is not, at present, needful for us to plant trees on our waste lands; all that we are required to do to secure in not very many years an immense return from these lands, would be to protect the trees which nature, herself, has caused to grow upon them. The question

arises, How can this be done? Probably the best way to attain this end would be for the Government of the country to offer a prize of, say $500, for the best 50 acres of second growth pine land, which is to be found in the country at the end of ten years, say from the date of making the offer, with second, third and fourth prizes of less value to other tree preservers of like extent. People thus preserving their trees would find that, beside the value of the bonus, there would be a real cash value in the lumber which they had protected, and others would be led to follow the good example set them. Of course there would have to be conditions attached to the grant of bonus, and the age of the trees would have to be taken into considsration, as well as the care to to be bestowed upon them. This, it seems to me, would be the readiest way of awakening our people to their best interests in this matter. It is almost unnecessary to remark on the destruction of the forests of America; on the policy of all enlightened European Governments in conserving their forests, and on the innumerable bad economic and climate results of the wholesale removal of forests, either by fire or the axe of the woodmen. These facts have just begun, almost too late, to make an impression on the people on this side of the Atlantic."

THE ALLEGED UNHEALTHINESS OF WOOD PAVEMENTS.

A perfectly unreasonable objection is now made against cedar block pavements, on the ground that they are unhealthy. This objection is worth meeting, for it is the last kick of an opposition to reformed roadways, which once was a formidable enemy to the public good.

Wood as a material for roadways is no more justiy chargeable with unhealthiness, because of the presence upon it of filth, than is any other pavement allowed to get into a similar condition. If some of those who object to wood pavements because the Corporation neglects its duty as conservator of the roads would kindly indicate a road material able to keep itself clean the world would be greatly obliged. It is not fair to attribute to the material of which the road is made the responsibility for the foot or more of mud which is often allowed to accumulate upon it. The only ground upon which wood as a road material can be charged with unhealthiness is its liability to decay.

Let us look into this matter. At the start we are confronted with the fact that the European cities which have had ages of experience with all kinds of roadways are at last adopting wooden blocks. In one place wood is superceding macadam; in another, cobble-stones; in another, asphalt; in another stone blocks. Is it likely that all these old tried pavements would be abandoned for wood if there were any sanitary objection to the latter? And is the state of sanitary science in Europe behind its state in Toronto?

Let us look a little further into the matter. Wood decays. Quite true with respect to pine and hardwoods, but only remotely true as respects cedar. On our streets cedar will wear away long before it will rot. But admitting that the cedar blocks do decay, what an inappreciable addition to the vast mass of decaying wood or vegetable matter. Our streets are lined with sidewalks of decaying wood. We walk on floors made of decaying wood. Our houses are frequently built on posts of decaying wood and are pitched upon soil a full half of the upper stratum of which is decaying wood or vegetable matter. Our streets are lined with sidewalks of decaying wood, laid upon sleepers of rotten wood, and they upon earth which is reeking with vegetable rottenness. At least ten times as much wood rots away every year in Toronto sidewalks as will ever rot away in the roadways, in the form of cedar blocks. Then we have thousands of trees in our streets, and upon every one of them more or less of rotten wood. In the autumn these trees shed numberless millions of rotting leaves. Millions upon millions of feet of wood are decaying in our fences; and last but not least, this is still a forest country, and the air comes to us laden with gases given off by an incalculable amount of rotten wood and vegetable matter. The addition of a few miles of cedar blocks upon our streets would make a smaller addition to the amount of the gases of rotten wood in our atmosphere than would be made by the addition of a bucket of water to Lake Ontario.—*Toronto Globe.*

A HINT FROM JAPAN.

A notable instance of the Japanese understanding of the conditions under which they exist occurs in the manner of giving security to pagodas, says Dresser's "Japan." Pagodas are of great height, yet many have existed for 700 years, and have withstood successfully the many vibrations of the ground, which must have inevitably achieved their overthrow had they been erections of stone or brick. When I first aseended a pagoda, I was struck with the amount of timber employed in its construction; and I could not help feeling that the material here wasted was even absurdly excessive. But what offended my feelings most was the presence of an enormous log of wood in the centre of the structure, which ascended from its base to its apex. At the top this mass of timber was nearly two feet in diameter, and lower down a log equally large was bolted to each of the four sides of this central mass. I was so surprised with this waste of timber that I called the attention of my good friend Sakata to the matter, and especially denounced the use of the central block. To my astonishment he told me that the structure must be strong to support the vast central mass. In my ignorance I replied that the central part wat not supported by the sides, but upon reaching the top I found this monstrous central mass suspended like the clapper of a bell; and when I had descended I could, by lying on the ground, see that there was an inch of space intervening between it and the earth which formed the floor of the pagoda. The pagoda is to a Buddhist temple what a spire is to a Christian church; and by its clever construction it is enabled to retain its vertical position even during the continuance of this vast pendulum the centre of gravity is kept within the base.

THE CARE OF STEAM ENGINES.

A contemporary has gathered the following instructions for the care of engines:

Never allow an engine to become dirty.

Never depend entirely on patent oil cups.

Do not allow the packing to become hard and dry in stuffing boxes, as it has a tendency to cut and flute the rods.

Never strike any part of an engine with the face of a hammer or head of monkey-wrench.

Never set steam packing, cotton waste, tops oil cups, or anything whatever that is to be used around the cylinder, valve, piston-rod or bearings of steam engines, on the floor, as they will invariably pick up sand or guit, which injures the rubbing and revolving surfaces with which it comes in contact.

When practicable, piston and valve packing should be applied when the stuffing boxes and rods are cold. The best packing is often destroyed through ignorance or want of skill.

Almost any packing may be improved by being soaked in beeswax, tallow and black lead.

Gum joints that require frequently to be taken apart should be coated with chalk before being placed between the flanges. This prevents the gum adhering to the metal and being destroyed when the joints are taken apart.

All gum joints located in the water space of steam boilers should be coated with lead and tallow before being put together. This has the effect of preventing the sulphur of the gum from attacking the metal and destroying the surfaces.

Always see that the cylinder drain cocks are open when the engine is standing still; never close them till after starting.

Never admit the tallow to the cylinder until the engine is fairly under way and the cylinder drain cocks closed.

Before starting an engine always warm up the cylinder by admitting steam to both ends.

Always start an engine slowly, and allow it to come up to speed gradually.

Whenever an engine is stopped for any length of time, examine all its parts and see that they are in good working order.

When it becomes necessary to stop an engine with a heavy fire in the furnace, place a layer of fresh coal on the fire, shut the damper, and start the injector or pump for the purpose of keeping up the circulation in the boiler.

In case of extreme heating, slack up on the keys and gibs, permit them to run loose for a time; then take up the lost motion gradually.

Examine the piston packing in the cylinder frequently; keep it tight and in good order.

Keep your steam at the same pressure. If the steam is allowed to rise above the working pressure, the engine will increase its speed, which will induce a loss of speed, as every revolution above the speed at which the machinery is geared for the manufacture of different materials is a waste and every revolution the engine falls below the regular speed is a loss of production.

A NEW BINDING MATERIAL.

Tripolith is the name given by its inventors to a new binding material for builders, a substitute for lime, cement and plaster under certain circumstances, and which is composed of sulphate of lime, coke and oxide of iron in some form or other. While tripolith mixed with sand only, sets in 10 to 15 minutes, an addition of slaked lime may easily increase the time required for setting to 60 minutes. The specific gravity of tripolith is lower than that of plaster; the former is 1.678 the latter 1.696. Turning now to the test, we give the mean results in each case of five complete experiments.

The extraordinary increase of tensile strength after a long exposure to the atmospheric air is remarkable; it amounts to 100 per cent from seven to ninety days in mortar B, and to 189 per cent in mortar C for the same time. Compared with the tensile strength of lime and cement, the results obtained with tripolith are highly satisfactory. The compression tests point out for tripolith a position between lime mortar and cement mortar, but since after being fairly set it acquires about the same crushing strength as ordinary bricks, no more would be needed for general use. In setting, tripolith mortar loses in weight, and when placed in water does not absorb the latter so rapidly as ordinary mortar does. Its adhesion to brick, stone and other materials is very considerable, and the tripolith mortar does not either reduce or increase noticably in volume when setting. For facing and plastering, this material is excellently suited; it is easily handled and smoothed while soft, adheres well to brick or stone surfaces, and attains far greater hardness than plaster-of-paris, and oil or other colors adhere to it well.

ROMANCE OF THE CAMP.

The monotony of logging camp life is occasionally varied by something thrilling. Sometimes it is an accident, causing serious injury or death; at other times it is a fight, resulting in spotted countenances, or worse. Occasionally a bear or a wild cat is met in the woods, and the foundation of a narrative of lucky escape is thus laid, which the hero of the adventure never fails to make the most of. It is, however, seldom that the logger is treed by wolves, but here is a story, that comes from Wisconsin, which contains just such a rarity:

On the Tomahawk river, near J. E. Leahy's camp, December 23, while the cookee, James McNamara, was carrying the men's lunch out into the woods, and about one mile and a half from camp, he was set upon by a pack of six wolves. He dropped the basket and sought refuge by climbing a tree, and commenced to yell and shout; fortunately, he was heard by Frank Synnot, the foreman, and E. H. Gallagher, the cook, who immediately seized their guns, and started in the direction from whence the shouts proceeded; they arrived in time to see the wolves scampering off, after devouring the contents of the lunch basket, and to relieve McNamara from his perilous position, as he was almost tired out clinging to the tree. The enterprising foreman, knowing that wolves were around, from having heard their melodious lullaby, had procured some arsenic, a small portion of which he put on some meat, and placed pieces in different places, and on Christmas morning he had the gratification of finding six big, gray and black timber wolves, stretched their full length on the snow. The heads are now in possession of the clerk of Lincoln county, and the skins he sold to Charles Quandt, of Wausau.—*Northwestern Lumberman.*

The United States Timber Duty.

The Boston *Advertiser* says:—How is the duty to be defended as a measure of protection? The object of protection is not to confer a benefit upon the producers of the articles protected, but to benefit the whole country. Unless a protective duty either helps to develop an industry which it is important for the whole country shall be developed, or helps to maintain the existence of industries which the good of the country requires shall be maintained, there is no good defence of the duty. How stands the case with lumber? Under the present tariff the whole burden of the home demand for lumber is thrown upon the home forests. Less than six per cent. of the pine and spruce lumber manufactured in the United States in the course of a year is imported from Canada, which is our only foreign source of supply. But we use about eleven thousand million feet of these kinds of wood every year, and according to the last census there is left standing not more than eighty thousand million feet of white pine in the whole country.

For Fence Posts.

A writer in an exchange says:—"I discovered many years ago that wood could be made to last longer than iron in the ground, but thought the process so simple that it was not well to make a stir about it. I would as soon have poplar, basswood or ash as any other kind of timber for posts. I have taken out basswood posts after having set seven years that were as sound when taken out as when first put in the ground Time and wear seemed to have no effect on them. The posts can be prepared for less than two cents apiece. This is the recipe: Take boiled linseed oil and stir in pulverized coal to the consistency of paint. Put a coat of this over the timber, and there it not a man that will live to see it rot.'

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on Dec. 30th, 1881 and 1882, aud also the Consumption for the month of Nov., 1881 and 1882:—

	Stock, Dec. 30th. 1881.	*Stock, Dec. 30th. 1882.*	*Consumption for the month of Dec. 1881.*	*Consumption for the month of Dec. 1882.*

A LOOK-OUT.

Our readers will not expect from us a homily on the course of time, such as at this period befits the sages of the daily papers, who devote themselves to summing up the events of the past year, and moralizing on them like Touchstone in "As You Like It," to the edification, no doubt, of many of those who look to them for inspiration and guidance; but such diatribes would be inappropriate here. Of the great men who have been taken away from us since this time last year, and the little men who have become great, it is not our province to discourse; our mission is to investigate the progress of the timber trade, and to show from the familiar incidents of the past, and the state of affairs in actual present, what the course of business is likely to be in the coming year, on which we are about to enter.

Even this, however, we can only do incidentally just now, as we have to reserve for our summary of the year, about the middle of January, a more extensive survey of the trade; at present we must be content to touch on the prospects from abroad, without dwelling on those nearer home; and, indeed it is the foreign and colonial information upon which all our reasoning as to future supplies is founded.

We intimated a month ago that Russia was forming a chain of railways to connect all her workable forests with the nearest shipping ports, and, in fact, that the whole of them were now in communication with the sea. That is, perhaps too large a phrase when we think of the vast territory which the name of Russia represents; but it may be understood to mean that the forests within any feasible distance of the rivers that find their way to the waters of the Gulfs of Bothnia and Finland are now capable of getting their produce forwarded to the nearest rivers by means of railroads, where heretofore they were considered inaccessible to commerce on account of the serious impediments between themselves and navigation. On this account we may consider that, whatever the importation from Russia has been this year, it is likely to be very much larger in 1883.

From Norway the same increase is expected, and very much from the same cause. A great portion of the Swedish trade on the western borders will by the new railways find its way to Drontheim, we are told, and very much increase the trade there. Our Christiania correspondent also in our last number furnished reasons why "it would seem probable that a great quantity of timber could not fail to be brought forward for next year's sawing season." He suggests, however, the usual uncertainties, and the indisposition of merchants to pay the prices demanded in the interior as likely to check the supply; but we remember no instance of its having done so. The men who have timber to cut down during the winter for market will hardly be diverted from their purpose by a difference of a few shilling per standard when the price is yet remunerative; and, in fact, it is merely a question of the woodmen being out of employment or getting something less per week for their labor, and though they may hesitate over it for a while, we seldom hear of them refusing by strike to accommodate themselves to the changes of the times. What may help to keep Christiania prices at a fair level is the impression that a diminished production of flooring may be expected there, on account of the mills that were destroyed by fire this year, those of Messrs. Kjosterud, Breien & Co., and of Messrs. Maarud & Co., which have not been rebuilt. On the other hand, it may be assumed that it will render battens more plentiful, as fewer of them in that neighborhood will be wanted for conversion, especially as our correspondent allegos that shippers "do not appear very eager to secure them."

On the whole, therefore, we may set it down that there will be plenty of wood manufactured and unmanufactured, to come forward from Norway, and that it will come in some shape or other there is every reason to believe.

If we now turn our attention to Sweden, the chief source of our supply of European timber goods, we see every indication of a plentiful supply. The shortage that was foretold in 1880, but which did not come to pass in 1881, it was then explained to us, would not be seriously felt till the following year, as only 20 or 30 per cent. of the winter's cut came forward the same year. In 1882, therefore, we were to be punished for our incredulity; but this year had hardly begun when the theory had ceased to be listened to, and instead of a shorter export from Sweden this year, the first ten months of it gave an excess over the same months of last year in sawn and planed wood of 135,000 Petersburg standards, and no less than 55,000 loads of square and rough timber, the greatest export, we believe, ever yet reached in the same number of months, and leaving after it a larger remainder at the shipping ports, and on the way to them, than any previous season.

At the meeting of saw mill owners at Stockholm, on the 16th of December, respecting which we published a telegram in our last impression, the opening surplus to begin next season with was acknowledged to be 50,000 standards over that of last year, and, without any inclination to ascribe to those gentlemen a desire to mislead buyers on this side, we may safely say they were not likely to err in the direction of overstating the case. Possibly 100,000 standards may be nearer the mark, but it is by no means necessary to press the point. With more than an average winter supply in this country, a great many vessels frozen up in their ports with cargoes, which could not get away in time, and a larger stock than usual for f.o.w. shipment, it is within the boundary of rational probability that any increase of price can be established in those regions during the coming year?

Yet our correspondent tells us that in the north of Sweden "there is a decided stiffening feeling prevalent among holders of sawn stocks;" but he admits that it will not be wise "to stand out for the full prices obtained during the early part of the last season," though the output may be diminished "by the immense masses of snow that have fallen in many parts of Norrland," which will make it "a matter of considerable trouble and expense to get at the timber." Reports of this sort, though perhaps very intelligible in Sweden, are rather confusing here. If the snow does not come down, or there happens a scanty supply of it, the trade is accustomed to hear great lamentations over the unfavorable state of the forests for logging purposes; but here we have an account of plenty of snow, which is represented as a serious impediment to the delivery of the timber. Offsetting one argument by the other, readers will be apt to consider them like negative quantities in algebra, which represent next to nothing. Snow, however, may be very useful, like brandy and water, to a certain extent, but to much of it is found to be worse than none at all.

In this short analysis of the state of the production of wood for exportation in Northern Europe we have endeavored to ascertain the turn that the trade is likely to take at the opening of the coming season, and we imagine that the impression left on the mind of the reader will be that, whatever else may happen, there is no likelihood of any shortage in the customary supply, but on the contrary that it promises to be on a very liberal scale indeed; nor is the state of the stocks in this country so low as to necessitate an early or urgent demand for an increase of them. On the other hand the continental requirements may be much larger than they were last year.

It was very naturally supposed the crisis in Paris last January, consequent on the failure of the Union Generale for such an immense amount of money, would greatly discourage trade in France, and no doubt it did so to a certain extent, but it is a mistake to suppose that money is not still very plentiful among mercantile circles in that country, and the requirements of the timber trade will probably be on a very liberal scale, for nothing is a better test of the state of trade in any realm than its export and import returns, and from these we learn that the value of the latter for the past eleven months ended, exceeded those of last year for the same period by £4,356,920 sterling, and the exports by £5,885,800—clear evidence that France is still enjoying a very considerable measure of commercial prosperity, and that no interruption to the public works authorized by the legislature—and consequently requiring a large supply of foreign timber—is likely to take place.

We intended to glance at the state of the supply in hand on the American side, but have no space left to do so in the present number.—*Timber Trades Journal.*

AN ADMIRALITY SUIT.

In the case of Peter Muntz et al against a certain raft in the United States District Court, libelants, who formed the crew of the steam ferryboat Margaret, sued for salvage services rendered the craft when it got adrift in the river.

The District Court gave libelants judgment and awarded them salvage.

An appeal from this decision was taken to the Circuit Court, and Judge Pardee affirmed the decision.

On the appeal it was urged:

"1. That a raft of timber is not subject to the jurisdiction of the Admirality Court, in the matter of salvage.

"2. That the Margaret was too small and weak to be able to render salvage services to a large craft.

"3. That no salvage services can be allowed compensation when the property is not saved, and that the raft in this case was saved by the large tug-boats and not by the Margaret.

"4, That the services of the Margaret were of no value to the raft."

The court said:

"A few undisputed principles taken from the text-books settles this case.

"Salvage is compensation for maritime services rendered in saving property or rescuing it from impending danger on the sea or on a public navigable river or lake where interstate or foreign commerce is carried on. Maritime Salvage, sec. 67.

"Salvage may be shortly described as an allowance for saving a ship or goods, or both, from the damages of the sea, fire, pirates or enemies,' Jones on Salvage p. 1.

"It is absolutely essential that the salvors should have rendered actual assistance to the vessel in distress.' Jones, supra. p. 4.

"If part of a salvage service is performed by one set of salvors, and the salvage is afterward completed by others the first set are entitled to reward, *pro tanto*, for services they actually rendered, and this, even although the part they took, standing by itself, would not in fact have affected the salvage,' Jones, supra. 9.—*American Lumberman.*

OUR SPRUCE IN ENGLAND.

The London *Timber Trades Journal* says:—Trade in spruce on the west coast of Great Britain may be said to be at a standstill until the turn of the year. Merchants will now be stocktaking, and until they exactly know what they have on hand will be very averse to buying. Both the weather and the Christmas holidays have been against transaction in spruce deals, but at the commencement of the new year we hope to see an improved state of affairs. Merchants are very chary of buying, on account of expecting to pick up great bargains later on, and no doubt, while odd cargoes are dropping in on the market from time to time, it justifies the buyers in holding back from freely purchasing. Cargoes of spruce have been bought in the Liverpool market at equal to £6 17s. 6d. cost, freight, and insurance, and although the deals are from Nova Scotia, and may not satisfy merchants in quality as well as if they were St. John or Miramichi, still they do not fall far short of these; indeed, we have seen Nova Scotian cargoes equal to any from St. John or Miramichi, and if the shipment from these latter ports in late years are any criterion, we unhesitatingly affirm, compared with former times, the character of these shipments is deteriorating on the whole. So that between an ordinary Nova Scotian cargo and one from St. John or Miramichi there is not a great difference in quality. When spruce deal cargoes can be bought on this side at or under £7 cost, freight, and insurance, there is not much occasion for merchants or importers to hesitate, as at this figure it is generally safe to stock. The cost of producing deals in Canada is yearly increasing, and when we come to consider that a £7 cost, freight, and insurance sale means the cost of the deals and insurance being put at £4, leaving £3 for freight, it will be seen there is not much in this price for the shipper. We question if at this figure spruce deals are not produced at a loss, and we are therefore unable to comprehend how merchants on this side can expect to see prices any lower.

These Nova Scotian cargoes recently sold at Liverpool cannot but have brought a loss to those interested in them. When we take into account the freights lately paid for removing fall stock, with the high rates of insurance for winter risks, £6 17s. 6d. must have left a smart loss. It is rumoured that these low scales are in consequence of the cargoes having belonged to shippers in Liverpool reported in difficulties a couple of months back, and forced on the market by those having advanced against them, in which case the sales are hardly a fair test of what the market is.

TRESPASSING.

An Ottawa correspondent of the *Northwestern Lumberman* says:—This winter seems to be a particularly unfortunate one for operators in the woods in one respect, namely: trespassing on one another's limits. As many of the bounderies between limits have never been run in the field, it is almost impossible to avoid trespassing, more or less, and if limit holders would only adopt the principle of arbitration in cases of trespass, it would be better for all concerned, but it seems that when a trespass is perpetrated, it is always on a pet reserve, where the timber is much more valuable than on any other part of the limit; and when asked what sum will be accepted in compensation, either a demand is made for an equal number of trees which would make a square timber of 100 feet average, or a price is frequently put on a few hundred trees which is actually more than would have been accepted for the whole limit before the trespass took place. Neither of these demands being acceded to, they go to law: both parties spend $5,000 or $6,000 uselessly: the trespasser pays a trifle more than the first offer, and the party whose limit was trespassed upon, after he pays his lawyer and other incidental expenses, gets little or nothing for his timber. It seems strange that a body of such shrewd men as our lumbermen are, have not devised some easy, inexpensive method of deciding such cases, and thus save themselves large and useless expense, besides exposing the inward working of their business; but it is to be hoped that the time is at hand when measures will be adopted to remedy this unsatisfactory state of affairs, and that the decision of such claims for damages will be taken out of the hands of a jury composed frequently of men unable to appreciate the importance of the cases brought before them, and left to the unbiased judgment of honorable men engaged in the trade, who would make the fittest judges of what would, under the circumstances, be fair compensation for injury caused by cutting over limit lines.

INFORMATION ABOUT SAWS.

On few points connected with wood conversion is there more difference of opinion than the question of speeds. Commencing first with circular saws for ripping, for sawing soft and medium woods, a speed of 9,000 feet traverse per minute at the points of the teeth may be taken as a standard speed; if hardwood has to be sawn this should be reduced to about 7,500 feet per minute, and with very hard wood 6,000 feet per minute will be found sufficient. The shape, number, pitch and set of the saw teeth being modified to suit the nature of the wood.

In one experiment I put a circular saw, 30 inch diameter and 12 gauge, on a spindle and gradually increased the speed to between 12,000 feet and 13,000 feet per minute, when it became wavy and pliant and ran out of truth. It therefore follows that, not only is the extra speed entirely unnecessary, but it is positively detrimental, as more power is consumed, more heat engendered in the bearings, spindle and saw plate; extra lubrication is therefore required, and the belts deteriorate more rapidly. I should, however, prefer to err on the side of high speeds instead of low, as this necessitates perfect workmanship and finish not always found in these days of so-called "cheap" machinery.

The speed of circular saws for cross-cutting

can be increased with advantage 1,000 feet beyond those used for ripping say, to 10,000 feet per minute. The difference in the cutting action of the two kinds of saw teeth will readily account for the necessity of this increase in speed. In the case of a ripping saw the action is chiefly a splitting one, the saw teeth acting like a series of small wedges, driven into and separating the longitudinal fibres of the wood, while with cross-cutting saws the fibre of the wood has to be severed across the grain, is comparatively unyielding, and the teeth of the saw meet with much more resistance. It is found necessary to make the teeth more upright and more acute or lancet-shaped in their form than for cutting with the grain. Although the subject is one of great interest, time and space forbid extended remarks, and I pass to band saws.

Owing to the improvements in the manufacture of the blades and the machines themselves, the speeds of which it is safe to run band saws has increased considerably of late years. On machines in which the saw wheels are of small diameter, say below 36 inches, and where the arc of contact of the saw on the wheels is necessarily more acute, the speed of the saw blade should not much exceed 4,500 feet per minute. With saw wheels 36-inch diameter this speed may be safely increased up to 6,000 feet per minute; this is, however, on the supposition that the saw blades are of good quality, and that the top saw wheel is mounted elastically, and the machine generally is well designed and made. The proper construction and use of saws involves many important scientific points that are unfortunately much neglected, resulting in an enormous waste of material and power.—*M. Powis Bale in Mechanical World.*

A TOLL TEST.

On December 21st a law suit of considerable interest to lumbermen on the Wisconsin river was decided in Columbia county circuit court, at portage, Wis. It was the case of the Wisconsin River Improvement Company *vs.* John Woodlock, and was brought to recover tolls on 6,000,000 feet of lumber for passing through the improvement made by the company at the various dams, canons, falls and rapids on the river above Stevens Point, and payment was resisted on the ground that works which had been constructed at Grand Father Bull Falls were a damage to the running of logs, rather than a help; and that the improvements were the occasion of the big log jam which occurred at that point in the spring of 1881. Damages were asked for by defendants. The jury, after a short deliberation, returned a verdict giving the plaintiff 5½ cents, instead of 7½ cents, the maximum amount allowed by the charter, and refusing to allow the damages claimed. The suit brought a large number of the prominent lumbermen on the river to testify in the case. Both sides were represented by able counsel. It is claimed by some members of the Improvement Company that the real purpose of the suit was to force a reorganization of the company, by which the system of improvement was to be extended, after other parties were taken in, and the stock of the old company put into the new organization at 30 cents on the dollar.—*Northwestern Lumberman.*

A Sumac Duty.

The Legislature of Virginia desires to encourage the sumac-growing industry, and at its last session adopted a joint resolution asking governmental co-operation to that end. The body recognized the fact that a very large proportion of the uncultivated lands of Virginia naturally produces, in abundance, a fine quality of sumac, the gathering and manufacturing of which already employs considerable labor and capital, while about one-half the sumac used in the United States is produced by the pauper labor of Italy, and imported into this country at the insignificient tariff rate of 10 per centum ad valorem, and believes that the infant industry of the state eminently deserves to be encouraged and protected, to the end that wild and waste lands might be cultivated in the production of sumac, and a flourishing agricultural and manufacturing interest therein be established, as well as that a superior article should thus be obtained. Aid was, therefore, asked in the senate and congress in securing a protective export duty to be levied on all sumac grown or manufactured in foreign countries.—*Northwestern Lumberman.*

Logging Under Difficulties.

Sands and Maxwell, Pentwater, Michigan, write to the *Northwestern Lumberman*: A portion of the land we are logging this season is very rough, its roughness consisting of immense holes (potholes) resembling the imprint of an enormous washbowl being thrust into it, some of which are over 100 feet deep, quite large trees growing in the bottom just nicely showing their tops above. These potholes are so numerous that in many cases only a ridge just wide enough for a road separates them. They are so steep that hauling out with teams is impossible, and there is so much timber in them that hauling with blocks and tackle would be tedious and very expensive. We are now using one of G. S. Warms & Son's hoisting engines, with a 7x10 cylinder, and it works to a charm, making a trip every five minutes with an ordinary stone boat, and hauling two small or medium logs at a time. We have 1,000,000 feet in these places, and have no trouble hauling out logs that scale from 1,024 to 1,225 feet.

Canadian Hardwood.

The *Monetary Times* says:—Referring to our recent article on Canadian hardwoods, Mr. Ouillette, of Amherstburg, Ont., informs us as under: "There is a great deal of Balm timber in Essex county, and a large business is done in it. I myself have from fifteen to twenty million feet of it standing. I manufacture from 1,000,000 to 2,000,000 feet per year in lumber, mostly for the Eastern States, and I also sell a quantity in Canada. We also cut a large quantity of oak annually for car-stuff which is sold chiefly in Canada. A great deal of white and black ash is cut hereabout, and sold in the Dominion and the Eastern States, chiefly in the latter.' From the data given by this exporter we should infer that the outlook in hardwood lumber is very promising for next year.

St. Louis Cooperage.

It is figured that during 1882, St. Louis Mo., and East St. Louis, Ill., reckoned together, consumed about 400,000 tight barrels, manufacturing 250,000 of the amount, the whole representing about 3,500,000 pieces of staves and heading, the year's business showing a slight increase of the previous year. In stock packages, 15.000 flour barrels and 8,000 fruit, potato and bottled beer barrels are daily made and consumed, the average price of these packages being 28 cents. The flour barrel demand is reported to have fallen off, on account of heavy exportation in sacks, while the other packages named were more largely consumed, owing to heavy crops. The general business is in a fairly healthy state. —*Northwestern Lumberman.*

The Isthmus of Darien.

The *American Lumberman* of New Orleans: —A Merchant of this city informs us that a great quantity of Northern lumber and ready made cottages cumber the wharfs of Aspinwall, that thriving city of the Isthmus of Darien. On another page we publish a long account of the mercantile situation on the Isthmus, in which it will be seen that our correspondent predicts a great Isthmian lumber movement during the next year. From the information already received, it would appear that this movement has already begun, and that the lumber dealers of the coast are hastening to take advantage of the great demand for timber of all kinds at Aspinwall.

A Model Building.

THE *American Lumberman*, of New Orleans, says:—When the Mechanics', Dealers' and Lumbermen's Exchange adopt a plan for their new exchange building, we hope they will not forget to specify the using of every variety of wood procurable which can be used for ornamental and practical purposes. Ceilings, wainscots, panels, etc., finished in a variety of beautifully grained and colored woods would present a striking appearance, and do much towards making the exchange building one of the most attractive in the country.

FITS EPILEPSY
OR
FALLING SICKNESS
Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.
Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address
ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

EARS FOR THE MILLION
Foo Choo's Balsam of Shark's Oil
Posltively Restores the Hearing, and Is the only Absolute Cure for Deafness known.
This Oil is abstracted from peculiar species of small **White Shark,** caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous,** that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.
Hear What the Deaf say!
It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.
"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:
JAMES EPPS & Co., Homœopathic Chemists,
18Lly London, England.

$500 Reward!
We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ZUCCATO'S PAPYROGRAPH
is a new invention for the rapid production of fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.
Autograph Letters
Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet
500 COPIES PER HOUR
may be printed upon any kind of dry paper, or other material, in a common Copying Press.
This Is the Most Simple, Rapid and Economical Process yet Discovered.
THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.
The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.
For specimens of work, price-list, etc., address with stamp.
THE PAPYROGRAPH CO.,
43 and 45 Sbetucket Street, Norwicb, Conn.

Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. FEB. 1, 1883.

LUMBERMEN say that the snow is about the right depth for successful operations.

G. T. HASKEL & Co., are running a hoop factory at Ludington, Mich., sawing their hoops out of soft elm.

UP to the middle of January the C. N. Nelson Lumber Company, of Duluth, had nearly 20,000,000 feet of logs on the skidways, and the work was being pushed with all possible vigor.

THE *Timber Trades Journal* of Jan. 6, says: Six weeks ago it was thought that lower port spruce might reach £9 per standard at the Liverpool sales, but it has been going back ever since.

THE *Timber Trades Journal* says :—The demand for American walnut is greatly on the increase, and doubtless our readers will have observed how greatly the wood is now-a-days employed for cabinet purposes.

THE River and Streams Bill, twice disallowed by the Dominion authorities, has been reintroduced in the Ontario Legislature, and will undoubtedly be re-enacted. Its provisions must be familiar to our readers.

WILD cherry is a wood for which a large demand is springing up, which must inevitably make it very valuable in the future. It is used principally to supply the place of walnut. It is extremely close-grained and can be very highly polished.

BEGIN to lace a belt in the centre, and take care to keep the ends exactly in line, and to lace both sides with equal tightness. The lacing should not be crossed on the side of the belt that runs next the pulley. Thin but strong laces only should be used.

WE have received the first number of the *American Lumberman*, a new organ of the trade published at New Orleans. It contains a fund of valuable information, and will no doubt be appreciated by the important industry it represents. Its appearance is as creditable as its matter.

JOSEPH JACKSON, a farmer near Centerville, Ind., had a walnut knot on his premises which had grown there, and was supposed to be worthless on account of decay. While the boys were trying to see how much powder would be required to blow it up, a new idea struck the farmer, and he investigated further. The knot was sold for over $200 for shipment to Europe.

The Boston correspondent of the *Northwestern Lumberman* says :—Several vessels are now loading for South America, and one for San Francisco. The latter has taken on board a large amount of very fine walnut, ash, and oak. Considerable pine has also been shipped ; and there are now several lots of walnut and poplar on the docks awaiting shipment to Liverpool.

THE Ohio State Forestry Association has organized at Cincinnati. At a meeting January 13, the following officers were elected : Honorary President, John A. Warder ; Acting President, Warren Higley ; Vice Presidents, Durbin Ward, Charles Reemlin, Horace Wilson, of Columbia, Ohio ; Secretary, A. Leve ; Treasurer, J. H. McMackin. Meeting are to be held quarterly.

THE addition of resin to the tallow for belts used in damp or wet places, will be of service and help preserve their strength. Belts which have become hard and dry should have an application of nert's-foot or liver oil, mixed with a small quantity of resin ; this prevents the oil from injuring the belt and helps preserve it. There should be so much resin as to leave the belt sticky.

THE Marquette *Mining Journal* says :—The pine lands of the upper pensinula are being rapidly sold off, hardly a week passing without some sale of this kind being reported. The largest noted this week is that made by J. M. Longyear for the canal company, the tract disposed of consisting of some 1,700 acres of land located in township 42, range 33, the consideration being nearly $100,000. The purchasers were Detroit parties.

THE *Northwestern Lumberman* says :—The operators of the northwest have not only got their faces set in the direction of the splendid forests of the South, but many of them are throwing their hooks out in the direction of Puget Sound. Many inquiries have been made recently of the *Lumberman* regarding the timber resources of the Sound district, the facilities for lumbering, etc., and not many years will pass before some of the cash and experience of the Northwestern states will be brought into requisition on the Pacific coast.

THE amount of white pine lumber exported from the port of New York, as reported by the Export Lumber Company, for the years named is as follows :—

	Feet.
1877	47,314,000
1878	42,695,000
1879	45,861,000
1880	52,628,000
1881	70,781,000
1882	57,540,000
Total for six years	306,819,000

THE *Northwestern Lumberman* says :—The steamship Tangier, which is running for a Quebec lumber house, under the mangement of Shadbolt & Co., of New York and London, has been the cause of negotiations between the English and Spanish Governments. Her captain was arrested in Spain, but according to the accounts which have yet reaohed us, he was not so much in fault as the Spanish custom house officials, who appear to have fired on this British vessel on very slight provocation, and the fact of the same commander now bringing her to Philadelphia indicates that the crime could not have been great, or the "Dons" would still have him in durance vile. Owing to the difficulty in obtaining sailing ships, steamers are now coming into use for timber freight by firms whose trade is sufficiently large to admit of their employment. Handy little sailing vessels should pay well, with timber freights as they stand at present.

WHITE, FRIANT & Co., of Grand Haven, have lighted up their lumber woods at Six Lakes with street lamps. They have two camps employing 165 men and forty horses. They draw their logs with an engine and cars and put in 125,000 to 150,000 every twelve hours. They expect to put in 31,000,000 feet.

THE Chicago *Northwestern Lumberman* says : Many of the largest manufacturers do not hesitate to say that in their opinion lumber will rule lower in 1883 than in 1882. They base their belief on the fact that there is an immense stock of lumber in the country, and that the present logging season promises to be a very successful one in every direction.

THE *Lumberman's Gazette* says :—The man who can concoct some method of falling a pine tree without the necessity of the enormous amount of manual labor which is at present expended in that direction would not only confer a blessing on humanity, but would reap a harvest that would enable him to take rank among the millionaires of the country. His position in the world, in fact, would be more enviable than that of the editor of a daily paper.

THE Duluth *Lake Superior News* says :—McGuire & Wentworth have fifty men at work in their lumber camps on Rainy River, and a gentlemen who recently visited them, says that they have the model camps in that region. They are having good lumbering weather in that country and unless there is a sudden change, they will get out all they estimated at the commencement of the season—about eight million feet. These logs will be sawed for the Winnipeg market.

TREE PLANTING.

In the Ontario Legislature Mr. Wood moved that the treasurer of the Province, upon receiving a copy of the inspector's report, certified by the reeve and clerk, shall recoup to the treasurer of the municipality one-half of the sum paid by the township, under authority of the municipality under the act to encourage tree planting, the said copy to be forwarded on or before the first day of November in each year ; that the sum of $50,000 is hereby apportioned and set apart for the object, and shall be known as the Ontario tree planting fund. He declared that the Government had long taken a great interest in the question, and had sent delegates to recent forestry congresses and they had submitted reports and recommendations to the Government. The bill provided that 25 cents would be paid for every tree that had been planted three years, the amount to be handed over by the municipalities and one-half repaid by the Government.

Mr. Meredith asked whether the sums would be paid at once, or in three years hence.

Mr. Wood replied only three years hence.

The resolution was passed.

FOREST COMMISSIONERS.

The *Lumberman's Gazette*, of Bay City, Michigan, says :—Forest protection is being considered by each of the states, and the interest in this direction is having a steady growth. Vermont has sot an example to her sister states, by which it will be well for them to profit, by the appointment of two commissioners who are expected to devise measures to protect the forests of that state as well as to suggest means to replant those which had already been cut away. Throughout the new England states, says the Williamsport *Gazette*, there are, as is well known, large areas of territory that are so sterile as to be unfit for the ordinary purposes of agriculture. These could be planted with forest trees at a comparatively small expense, and would in time not only have a most beneficial result upon the water courses of the country, but become a direct source of profit to the individual proprietors besides. Pennsylvania has not so much sterile surface, comparatively, as the New England states, but there are, nevertheless, many thousand acres where a careful system of forest tree culture would prove valuable to the state and profitable to the individual owners. In fact, the plan pursued in Vermont commends itself strongly to every member of the Union. Sooner or later they will all follow her example, but it is highly important they should go to work now, and not put off the time until dire necessity compels us to take it up.

THE CLYDE TRADE.

Singleton, Dunn & Co.'s Timber Circular of of Glasgow, dated 4th January, gives a lengthy review of business during the past year. It says :—"During 1882 business was fair, and prices generally well maintained. The imports were about an average in quantity all over, but it it is noteworthy that a very large proportion of these were after September. At the end of that month it was ascertained that stocks were smaller than usual and in consequence goods were sent forward in such quantities at high rates of freight and insurance as leaves the aggregate stocks at the close of the year similar to those of the preceding year.

Trade generally was steady, and shipbuilding was unusually brisk. This import and industry will bo as fully employed in this year as in the past one—most of the yards having orders on hand to occupy them for a year at least. Housebuilding has not improved—if, indeed, it is not worse now than for the last twenty years.

Case making, owing to the large exports, has formed a large medium of consumption, and there are indications that this trade will be pretty active during the spring.

We again refer to the competition Quebec woods have to contend with in pitch pine and North of Europe woods imported direct and to east coast ports for consumption in Clyde districts. In volume these two classes of timber far exceed the total imports from Canada to Clyde.

Square white pine is very low in stock ; but this is due only to the unusually big demand for ship work. It is almost exclusively prime qualities that are taken by the shipbuilders, and it is the experience of the trade that the commoner qualities are unsaleable at rates to clear foreign invoices. In fact for rough carpenter work it is only now and again that contractors use it—finding suitable substitutes in the cheaper woods from north of Europe and the pitch pine ports.

Deals.—Those from Baltic districts have thoroughout the year been distinctly under the prices for Canadian, hence the difficulty in obtaining anything like renumerative rates for the latter. Of course, this applies to whitewood or spruce. Our experience is that in case making, where formerly the consumption was of pine only, it is now very much a matter of price as to whether pine or spruce shall be used. This acts most detrimentally on the lower qualities of Canadian pine. In times when housebuilding is active 3rd quality pine are largely used ; but in the present condition of things the foregoing remarks explain the slow sale and low values now ruling. Contracting in Quebec goods was on a restricted scale all last season, and we do not anticipate much improvement this season.

Freights.—In the spring from Quebec rates opened at 24s., receding to 22s. Then in midsummer and fall beginning at 24s., rates went to 28s., and a few ships at 30s. Deals from Quebec per steamers opened at 60s, receding to 52s. 6d. to 55s., latterly picking up to 80s. From the lower ports sailing vessels ruled at 60s. to 65s., at the closing going up to 77s. 6d. Steamers from St. John and Miramichi were plentiful in the early part of the season at 50s. to 55s., springing at the close to as high as 82s. 6d.

White Pine.—The stock is small, and firmly held. The consumption is below that of the previous year. Prime deck plank wood brought to 2s. 5d. for 60 feet average, and 2s. 7d. for 70 feet average at the beginning of the season, rising gradually till, at the close of the year, prices stand at 2s. 7d. to 2s. 9d. per cubic foot.

Deals.—The imports from Quebec were over those of the previous year, while from New Brunswick and other lower ports they were less than the previous years. Taken all over the consumption of deals was about an average. Quebec Yellow pine, 1st quality—Prices early last year were similar to those ruling at the close of 1881.

SOUTHERN TIMBER SUPPLY.

The southern pine belt, running through nine States, is believed to have contained, at the end of the census year, not less than 25,000,000,000 of feet of merchantable pine, or enough to last, at the rate of consumption of that year, 250 years. The value of this great body of timber is enormous, and must have an important influence in developing the material prosperity of the south.

The study of the actual condition of our forests indicates important commercial changes which may be expected to grow out of the changing conditions of the lumber trade. New Orleans seems destined at no distant day to become one of the greatest lumber distributing and manufacturing centres of the world. Its position with reference to vast forests, its commercial importance, and the ease with which logs may reach it by river and lake, point to this conclusion. A great deal of northern capital has been invested during the last few months in southern pine fields, and the number of persons seeking such investments is increasing. The best informed northern lumbermen realize at last that the time has come when they must seek new fields for their operations, or abandon the business entirely. These men are getting ready to move their mills, capital and energy into the south; and their attention is naturally directed to the Gulf states. * * *

The demand for southern pine for northern consumption and export is rapidly increasing also, and the country must not make the mistake, which it made first in regard to the pine supply of Pennsylvania and Michigan, and which the Californians are now making in regard to their redwood, and conclude that because the northern states contain vast quantities of pine, the supply will last forever. No forest is inexhaustible if nothing is done to protect or perpetuate it. The recklessness which has marked the management of forest property at the north has not been wanting in the south. The southern pine forest, as it stands to-day, is mature throughout and ready for the axe.—*The Nation.*

THE MURRAY CANAL.

The Ottawa correspondent of the Toronto *Globe*, under date Jan. 26th, says:—Mr. John White, M. P., for East Hastings, went west to-night. His visit to the city was in connection with certain alterations which he is anxious to have made in the contract for the Murray canal. He had an interview with the Minister of Railways to-day, and recommended that instead of allowing the Priuce Edward Railway Company's bridge to swing from an abutment in the middle of the canal the bridge shall be constructed in two sections swinging from each shore. The bank of the canal is also to be faced with stone, commencing eight feet from the bottom to a height of eight feet. Sir Charles Tupper agreed to adopt Mr. White's suggestions, and has sent for Mr. Rubidge, Chief Engineer of the work, to explain the required changes in the specification. The removal of the abatment from the centre of the canal is to admit of timber cribs from the upper lakes being floated through, thus avoiding the dangerous navigation of the Prince Edward coast. Mr. White states that all reports of difficulties in the way of constructing the canal by the Presqu'Ile route are wholly unfounded. No rock or quicksands have been encountered, and the contractors are well satisfied with the character of the undertaking. The lowest depth of water will be eleven feet, and the average from twelve to sixteen feet. The estimated cost of the entire six miles of canal is $800,000. The canal will be free, as there are no locks. A vote of $200,000 to continue the work will be asked for at the coming session.

DESTRUCTION OF FORESTS.

The question of admitting Canadian lumber into the United States is creating not a little discussion at Washington just now. The New York *Sun* regrets that some of the representatives of Michigan are much excited at the proposal to admit Canadian lumber free of duty, by way of preserving a little longer the pine forests of that state. Our contemporary then goes on to observe that "the speedy destruction of the forests of Michigan will prove a calamity of which its present members of Congress appear to have no adequate conception. These forests can never be reproduced, and it is the part of wisdom to preserve them. By judiciously and gradually thinning them out, they may be made to last for ages, and yet furnish as much lumber as is necessary for the use of the people. On the other hand, by destroying them at once a few lumber speculators may get rich, but the state will be permanently impoverished." These words apply to Canada just as strongly as the States, and are worthy of the careful attention of our legislators. At the same time it is the part of wisdom to make the forests productive of revenue by judicious sales, so that large private interests may unite with the government in preventing those periodical fires which have devastated so much valuable timber land. Proper regulations for the thinning out of the forests and for prevention of fires are what are most urgently required.—*Ottawa Free Press.*

MIDLAND, ONT.

The *Free Press* says:—The correct estimate of Dollar's mill has been made with very satisfactory results. From the 20th of May, the time the mill started, until the day it shut down, December 29th, the average output was 30,509 feet of lumber per day. If there is another single circular mill on these waters that has done work anything like this, let us hear from it. Mr. George Ross, foreman, has commenced to repair the mill, and every thing will be in first class order to commence next season's work. Chew Bros. are delivering at their mill a very fine sample of logs, to be manufactured into lumber as soon as spring opens. They expect to make an early start at their mill next spring. They are getting a large quantity of logs in a convenient position so that they can begin as soon as the ice breaks up.

Red River Timber.

We find the following account of the timber of the Red River Valley in the Emerson *International's* description of that region:—Fifteen miles east of the Red River at Emerson the line of continuous forest is reached—woods of almost impenetrable thickness, comprising all the varieties of the Lake Superior region. West of the Red River to the Pembina Mountain the various streams which drain this region sustain a fine growth of oak, poplar, elm, cotton-wood and the ash-leaved maple, Southern Manitoba being much more heavily timbered than the central or northern portion. Timber culture on the prairie is already carried on to a considerable extent, and in a few years quite a large quantity will be raised on "Tree Claims."

Drought in New England.

A serious drought has prevailed in New England since midsummer, with the exception of one storm in September. The consequence is that the streams and lakes are dried up, and hundreds of mills and manufacturing establishments are deprived of power to run. The effect of the drought was felt all the fall by the saw-mill interest, especially in New Hampshire and Maine, and, to some extent, in Vermont and northern New York. On account of the frequent recurrence of drought in northern New England, steam is being largely substituted for water power.—*Northwestern Lumberman.*

Why Called Pig Iron.

When iron is melted it runs off into a channel called a sow, the lateral branches of which are called pigs; here the iron cools, and is called pig iron. This is merc play upon the word sow. Now *sow* has nothing whatever to do with swine, but is taken from the Saxon *sawan*, to scatter, German *sausen*, to rush; and ought to be written *sous* (sows), a word in use still in the expression, "He soused upon him," i. e., swooped or rushed. Having sows or sow for the parent channel, it required no great effort of wit to make the lateral grooves the little pig.

A CHARTER is to be applied for on behalf of the New Glasgow Lumber company, with headquarters at New Glasgow, Que., capital stock to be $50,000 in shares of $100. Joseph Clarkson, Robert Clarkson, John Crediford, T. J. Claxton and F. J. Claxton, are to be the first directors.

Lumber Drivers' Calks

For Use in Stream Driving to insure a safe footing in Slippery Places.

25 in ball and 5 in heel are the numbers usually required.

3L6

JUDGE LAIRD, of Prince Arthur's Landing, being in Toronto, informed a *Globe* reporter that a heavy shipping and lumber trade is looked for at Prince Arthur's during the coming summer. In alluding to this Judge Laird remarked that "owing to its geographical position Prince Arthur's for at least seven months in the year is the commercial fulcrum upon which will swing the chief interchanging trade of the Dominion. Of necessity it becomes the great entrepot for the wares of the Eastern Provinces passing westward, and for the produce of the vast western country seeking outlet to the eastward."

Wanted.

A PARTNER that understands the SAW MILLING BUSINESS, with capital. For information address JAMES B. DICKSON, Pembroke, Ont. 21L6

FOR SALE!

The MURRAY BAY LIMITS

COMPRISING ABOUT

330 SQUARE MILES.

These limits control the whole territory on the Murray River. The limits are very valuable, heavily timbered with Spruce and Pine, interspersed with valuable hard woods, Poplar and White Birch. Apply to

HOWIE'S DETECTIVE AGENCY

OFFICES, 32 KING STREET EAST,

TORONTO ONT.

All legitimate Detective business attended to for Banks, Fire and Life Insurance Co's, also for private parties. This agency does not operate for reward. 1yL5

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily, and honorably. Address TRUE & Co., Augusta, Maine.

ROADSIDE TREES.

We take the following from the report of the Fruit Growers' Association of Ontario:—

The next topic was "What are the best trees for country roadside planting?"

Mr. BEADLE.—I would suggest that one of the prettiest trees for roadside planting is the rock elm. Of course the roads must not be too narrow where those trees are planted, or the trees be planted too thickly, because they will shade quite a space. I would also mention besides that our own white ash. If the trees should happen to be planted too thickly, so that it will be necessary to take some of them out, the wood will be worth all that the trees have cost.

Mr. BUCKE.—I would suggest the black walnut, providing it is planted in great number, so that the boys should not break them all down to get the nuts; also the maple. In fact, excepting the soft wood trees, I do not know of any tree that would not be suitable for a roadside tree.

Mr. HONSBERGER.—I like for a country roadside tree the Norway spruce, and then between them, at a nice distanco for a walk, plant the soft maple.

Mr. BUCKE.—I think the Norway spruce would be apt to make drifts in the winter time, if there should be much snow.

Mr. HONSBERGER.—A person would naturally think so, but I can say that I am very fortunately disappointed in that myself. I have planted them by the roadside, both running north and south, and running east and west, and they are not liable to cause the snow to drift.

Mr. DRURY.—We plant maples in our part, on account of their assuming such a beautiful shape in a few years. We also plant the spruce and the white pine.

Mr. BUCKE.—The great trouble in planting roadside trees is the cattle. Until we can get some law passed to prevent cattlo running at large, it is difficult to prevent the cattle rubbing them down. I look upon the subject of tree planting as depending entirely on the cattle question.

Mr. DEMPSEY.—I fully endorse what the secretary says respecting tho elm. In some of the Eastern States they use the elm, and they are certainly all that we need desire for a roadside tree. I have seen the white bark birch planted on the roadsides. It certainly is a very pretty tree—attains a very graceful and beautiful form, and I think it is much prettier than the maple, particularly the hard maple. The soft maple makes a rapid growth, and it is a very pretty tree for the roadside. Where the black walnut grows alone it appears to attain too much of a spreading habit. I presume it could be trimmed up. Speaking of the elm again, I believe that on the front of Sydney, in the county of Hastings, they have one shade tree in a distance of about twelve miles. They deserve thanks for leaving that. That elm spreads farther than the width of the room, and I have driven under it frequently when I have been out on that road in the summer—it is a very hot road—and I have enjoyed a rest there very much. And I presume my horse has enjoyed it more than I have. Any one who has ever stopped to rest in the shade of a tree like that can certainly appreciate the value of the elm.

Mr. DRURY.—There is no doubt that in the absence of a stock law in this country the planting of trees on the roadside will be very rare indeed. As a matter of fact, if one municipality takes a stand against cattle running at large, the adjoining municipality may not take the same view of it. And in that way the measure of the first municipality may be rendered abortive. In our part of the country we have a few very nice drives, that have been made by a little care in the clearing up, by parties taking the trouble to throw the brush back and leave the trees in a line. Speaking of the country as a whole, it is almost impossible to say what tree is the best for roadside planting. I think we must first have a stock law, and than I believe there will be a desire on the part of municipalities, as well as on the part of individuals, to beautify our roads by planting trees.

MR. PAGE.—I prefer for the roadside either elm or maple; but, as has been said by former speakers, it is useless to talk about planting shade trees on the roadside while the cattle are running at large.

MR. GOTT.—There are three or four kinds of maple that are very valuable. The only objection to planting it is that the roots spread so far in the soil. But it is a very beautiful tree. Our basswood tree for roadside planting is not only ornamented but useful. The chestnut tree would also make a very beautiful shade tree. It is both useful and ornamental likewise. So also is the hickory. The Lombardy poplar and the ironwood tree are beautiful trees for our roadsides.

MIRAMICHI TRADE.

Mr. J. B. Snowball's Miramichi wood trade circular for the year 1882, is as follows:—

CHATHAM, MIRAMICHI, January 2nd 1883.

The cost of logs during the past season was about an average, and all were brought to market, but the brook driving was slow and expensive, so that the stocks stood in the market at a high first cost, and prices were stiffly maintained by holders during the season.

The fluctuations and unexpected advance in the freight market were important features of the season's business. Early charters of sailing vessels were made at 61s. 3d., but at the opening of navigation steam tonnage offered freely and accepted rates as low as 52s. 6d. This had the effect of inducing the better class of sailing vessels to go on long voyages, making fall tonnage scarce. Rates began to advance rapidly in August, and 82s. 6d. was reached before the close of the season.

Although the price of deals in the English markets fluctuated during the year from £7 to £8 12s. 6d., still prices on this side were steadily maintained, and neither deals nor logs at any time, sympathised with any of the changes, showing that producers not only had confidence in the market, but that their stocks, having cost prices equal to tho highest quotations, they would hold over rather than make any concession in price.

The export business not only of this port, but of the Province, is gradully concentrating into fewer hands, which, to some extent, accounts for the steady price of New Brunswick goods.

Seeing that the Nova Scotia exports, although small, play an important part in the fluctuations of the British markets, I have procured a return of them for this issue. Though, perhaps, not fully complete, it shows approximately the export of that Province. There are many creeks in Nova Scotia from which a cargo or two are shipped, but these places being outports the shipments are credited to the nearest port of entry, and, in some cases, these ports are on the opposite side of tho Province from that where the entries would indicate that the shipments were made.

The stocks wintered will aggregate, in round and sawn woods, 35 millions sup. ft. against 33 million last year, 16 millions in 1880 and 70 millions in 1879.

The shipments for the past five years were as follows:—

1877—150	Millions	superficial	feet.
1878—106	"	"	"
1879—114	"	"	"
1880—155	"	"	"
1881—128	"	"	"
1882—117	"	"	"

NORTHWESTERN LUMBERING.

Tho Selkirk *Herald* says:—Mr. E. F. Rutherford, of the firm of Drake & Rutherford, of this town, came in on Saturday last from his firm's timber limit on Fisher River. He and one of his men travelled in company, and they had Indians, with dog-team, to carry their luggage. They walked all the way, a distance of 120 miles, the thermometer one night registering 40° below zero. They had to camp out one night, and passed the time very uncomfortably. They kept up a huge fire, which, however, scorched their faces while their backs felt the frost keenly. Mr. Rutherford was four days on the road, and he will not forget his experince for some time.

The firm of Drake & Rutherford have a claim at Fisher River forty miles in exteut, and on it they have a double circular sam mill. They intend hauling sufficient logs this winter to supply 4,000,000 feet of lumber. They have seventy men at work in their camp and as their haul is a short one they expect to make very good progress. It will take five years at least to take all the lumber off the claim. The principal timber is tamarac and spruce of good quality. Mr. Rutherford states that all their lumber will be transhipped at Selkirk, and he hopes that the Selkirk branch of the C. P. R. will be completed in time for the opening of navigation next spring. He thinks that very little lumber, if any, will be taken up to Winnipeg by boat once the Selkirk railway is open.

Mr. Rutherford has gone to Stonewall, and will on his return from that place go to visit friends at Millbank, Ontario. He will return in March.

MAINE TAMARAC.

A correspondent from Bangor, Me., writes as follows to the *Northwestern Lumberman*:—Tamarack, more commonly known here as hackmatack or juniper, grows on wet land, mixed with other woods, cedar mostly. On some tracts second-growth juniper is about all there is. On such tracts quite an extensive business is done in cutting ship knees, the largest root being dug out to form the short arm of the knee. The body of the tree has little value for timber, as it is "churn-butted." The growth of such timber is rapid, the grains measuring from one-eighth to three-eighths of an inch. Some of the second growth is very thick and the trees tall, with few limbs, and of little value except for wood when near a market. The old growth is much more scarce, and the stumpage as valuable as our best pine. It is used for ship frames, the patterns being taken into the woods and the frame shaped by hewing—"moulding a frame," it is termed. It beings from $2 to $3 per ton stumpage (40 cubic feet), and is worth from $16 to $20 per ton at the ship yard. This old growth is seldom found in large quantities, like spruce or pine, but scattered with other kinds. On remote lands the logs are sided, driven to the boom and moulded at the yards. The timber is about as heavy birch, and considerable of it would sink if not sided. The largest stick I ever saw scaled 3,500 feet, but it would be a fine lot that would average 200 feet. For strength, solidity, durability and "slivering" it is about equal to the best hard pine. It is used to quite an extent for railroad sleepers. It is not as durable but holds a spike better than cedar, and is much used on curves and switches. I have never known of its being used for shingles, nor of the bark being put to any use.

There are from 20 to 30 inches of snow in the woods on our waters, with perfect weather for logging.

MONTREAL NOTES.

The Montreal *Gazette* of Jan. 16, says:—There is already an inquiry in this market for spring shipments of pine for the American markets, several buyers from New York and Albany having recently been in this city for the purpose of anticipating their future requirements. There is also an American demand for ash for immediate delivery at full prices. Stocks here are generally well assorted, a fair local consumptive demand is reported, and dealers look forward to the spring trade with a good deal of confidence. One of our leading dealers, who has recently returned from New York, says that notwithstanding the anticipated large supply of logs this season, it is expected the United States markets will need all of it. Private advices from Ottawa state that Americans are looking after their spring supplies of lumber in that market also.

THE REASON OF IT.

The *Lumberman* of Dec. 23, made mention of a badly acting tramway at Elmhurst, Wis. Mr. E. P. Cowles, of that place, wishing it to be known why the road has not been a complete success, writes as follows: The road was built for the purpose of running lumber out to Elmhurst in the fall, and logs back to the mill in the spring, with the intention of suspending operations in the winter. Owing to a delay of two months in getting the engine out, it was not on the ground until November, when it was found that the track was unfit for use. Through lack of experience and judgment on the part of the builders, it was laid with no adequate foundation. The rails were not pinned or secured in any manner. Stumps and obstructions were left inside the track which interfered with and broke the machinery. Six weeks were consumed in repairing the track in a hasty and imperfect manner which brought the starting up in the bad weather of December with no preparations whatever for running in winter, and the track in no condition to work at this season of the year. When lumbermen learn to build pole roads with the same care and in the thorough manner that other roads are built, and pay proper attention to laying out and grading, they will be found to be thoroughly efficient and serviceable.——*Northwestern Lumberman.*

REPAIR THE RUIN.

The necessities of their situation have aroused the people of some of our western states to action. In Kansas, Nebraska and other states liberal premiums have been offered for the encouragement of tree planting, and already in many portions of the prairie region a perceptible change has taken place, and the eye no longer wanders over great spaces without sight of shrub or tree. Minnesota has her Forestry Association, and its secretary reports that between seven and ten millions of trees were planted in that state during the years 1877, of which more than half a million were planted in a single day, "Arbor Day," as it was called, or tree-planting day, the first day of May having been fixed as the day, and every owner of land invited to devote the day especially to the planting of trees. Efforts have been made in other states which are similiarly situated in respect to a supply of forest trees. The great railway companies, whose roads stretch across the treeless prairies, have become in some instances large planters of trees, feeling the need of them, both as screens from the Rocky Mountains and as a source of supply for the ties which are constantly needing renewal.—*Lumberman's Gazette.*

The Oak and the Orange.

From an acorn weighing a few grains a tree will grow for 100 years or more, not only throwing off many pounds of leaves every year, but itself weighing many tons. If an orange twig is put in a large box of earth, and that earth is weighed when the twig becomes a tree, bearing luscious fruit, there will be nearly the same amount of earth. From careful experiments made by different scientific men, it is an ascertained fact that a large part of the growth of a tree is derived from the sun, from the air and from the water, and a very little from the earth; and notably all vegetation becomes sickly unless it is freely exposed to sunshine. Wood and coal are but condensed sunshine, which contain three important elements, equally essential in both vegetation and animal life—magnesia, lime and iron. It is the iron in the blood which gives them the durability necessary to bodily vigor, while the magnesia is important to all the tissues. Thus it is that the more persons are out of doors the more healthy and vigorous they are, and the longer they will live. Every human being should have an hour or two of it, and in the early forenoon in summer.

Letter from Member of Congress.

HOUSE OF REPRESENTATIVES,
Washington, D.C., Feb. 19, '82.

GENTLEMEN,—Inclosed find $1, and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a bad cold, as has almost every one else here, but cannot find the Elixir, which I used frequently at home and consider a most valuable medicine; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GROUT.

LITTLE BY LITTLE.—The constant dropping of water will wear away even the hardest stone. So the constant irritation of a cough will so wear upon the lungs as to induce incurable Consumption. Hagyard's Pectoral Balsam will cure the worst cough, speedily and effectually.

WALTER LINTON, of Waterloo, writes that Hagyard's Yellow Oil has done great good in his family, his wife being cured of Callouse lumps that other medicines failed to remove, he he also states that a neighbor was promptly relieved of Rheumatism by the same remedy.

WORTH KNOWING.—A Fact Worth Knowing. The best household remedy known for Coughs, Colds, Bronchitis, Asthma, Whooping Cough and all throat and chest troubles tending toward Pulmonary Consumption is Hagyard's Pectoral Balsam, to be procured of any druggist.

JOINERY FOR ENGLAND.

The London *Timber Trades Journal* says:—With respect to the trade in joinery that has been referred to in these columns as likely to be conducted on an extensive scale between this country and America, we observe in the pages of one of the leading lumber journals of the United States only a passing notice is given to the subject, no particulars are mentioned, and the paper in question refers to it more in the light of intelligence emanating from our side than as something with which they were immediately concerned. We may, therefore, safely assume that, whatever shape this new competition takes, it will be conducted on a very small scale; otherwise the trade journals of the United States would certainly have given us some information about it. For some years past what are termed "Yankee notions" have been arriving in steamers from New York, but the joinery they bring is of such little account in the timber trade that the prices of the articles so exported are not quoted even in their own journals. These nick-nacks are probably shipped intermittently on venture at a reduced rate of freight as broken stowage, and form no particular branch of the wood trade; certainly not of sufficient importance to cause our Swedish friends any uneasiness, or to rouse the joinery trade up in self-defence.

Liverpool Prices.

The London *Timber Trades Journal* says:—Anent the wood trade of Liverpool—judging of affairs from this distance, and from various reports which have from time to time reached us, and from other circumstance—we should say that in the one item of spruce deals the business is generally done at too fine a rate of profit to pay. Referring to the commercial habits of the Hollanders, a statesman—we believe it was the late Lord Palmerston—once remarked that:—

"In matters of commerce the fault of the Dutch
Was in giving too little and asking too much."

It might be well, if without earning a similar reputation, our Liverpool friends could combine to secure at leat a fair working profit, and one sufficiently large to cover the attendant risks of business. We believe that we are correct and fully justified in saying that at no other port in the country is the wood trade done at such a narrow margin of profit as at Liverpool.

The Dismal Swamp.

A recent visitor to the Dismal Swamp in Virginia found it much reduced in extent compared to what it was twenty years ago. It now contains some of the best farming land in the state. A railway runs across it, and it is on its way to final extinction. The drainage of the Lake Drummond, a central body of water lying higher than the average level of the swamp, would make the whole area fertile. This is a project of Gov, Benjamin F. Butler, who once had had surveys made, but at length abandoned it. The great industry of the swamp is lumbering. It is penetrated by small ditches in connection with larger canals, and by rude tramroads, over which the logs are hauled to be sawed into shingles, railway ties and fencing. The lake itself, however, with its almost impenetrable fringe of cypress and its projecting roots and broken stumps, is quite as dismal as ever.—*American Lumberman.*

Quality of Pine Deals.

The London *Timber Trades Journal* says:—In respect to Quebec pine deals we are continually hearing something of superior 3rd quality. We are not aware whether these deals are a shipper's brack or an importer's manufacture, but the circumstance appears to open out the important consideration as to whether there does not exist too great a margin in cost betwixt ordinary 3rd and 2nd quality pine deals. Unusally this margin approaches in extent to £4 10s. or £5 per standard, and it might well seem that an intermediate quality is desirable, and would meet with a ready market.

A HORSE disease is causing some excitement in the lumber camps of west Michigan. It is peculiar and unusually fatal, and seems to be contagious. In one camp over a dozen horses have died.

Chips.

AN unusually large number of spruce logs are being taken out in the eastern townships this winter.

The *Monetary Times* says:—Hemlock bark is worth from $6 to $7 per cord in the eastern townships, and the demand for it is brisk.

PHILIP RITZ has a tree planting contract with the Northern Pacific railway Company, and has been setting out along the line soft and hard maple, locust, walnut, box elder, peach, cherry, and apple.

M. P. GODFREY, manufactured last year at Alpena, 600,000 bed slats from mill refuse. A slick job. He has a contract for 1,000,000 next year. Why can't some of our mill men utilize their refuse in this manner?

THE *Northwestern Lumberman* says:—It is estimated that fully 100,000,000 feet of logs are already cut on the upper waters of the Menominee district. The Kirby-Carpenter company has already 20,000,000 banked.

THE *Monetary Times* says:—The pulp mills of the Three Rivers Paper Company, at Maddington Falls, with a capacity of five tons a day, are now in operation. It is intended to ship largely to the States, though a portion of the product will be utilized by the Portneuf mills.

THE Emerson *International* says:—Mr. S. R. Sutherland and other prominent gentlemen interested in the lumber trade, were the purchasers of the twenty-five million feet of lumber from the Rainy Lake Lumber Company. The lumber will be manufactured at the mills at Rat Portage and Fort Frances.

THE *Timber Trades Journal* of Dec. 30, says: The Liverpool market, some time ago exceedingly bare of the great selling commodity, spruce deals, now seems to be somewhat glutted. Orders from the interior have been scarce, and as a result prices have weakened and display no present tendency to recover their former position.

DURING the progress of some alterations in an old house in London, England, the paint was burnt off the panels of one of the room doors, when it was discovered that the woodwork was of excellent mahogany. Further examination showed that nearly all the painted woodwork in the house was mahogany. The house was built in the reign of Queen Anne.

THE making of wine casks appears to be an important industry at Bordeaux. We learn that there are over seven hundred cooper shops independently of those established at the large vineyards. Of these 140 are at Bordeaux, and 600 in other towns in the department. There are manufactured annually nearly a million and a quarter of casks, of the total estimated value of £700,000

AN Ottawa correspondent writing on Jan. 15, says:—Last evening a number of shanty teamsters arrived in the city from the Upper Ottawa. They were employed in the shanties of Captain Young on the Petawawa. They said the reason of their return was owing to the poor ice on the rivers and streams in that locality. They said that 14 teams in the employ of Sherman, Lord & Hurdman were drowned on Monday last.

The Napanee Mills Paper Company are preparing for the erection of a pulp mill for the manufacture of wood pulp for the express use of their extensive paper mills at Napanee, and that negotiations to secure site, etc., in Fenelon Falls are pretty well advanced. They will consume in the new manufacture, large quantities of poplar, basswood, white pine and other soft wood which have hitherto possessed little or no commercial value,

THE Ottawa *Citizen* says:—The rumor is again revived that the Canadian Pacific Railway contemplate putting a 400 foot addition to their lumber docks at Brockville, extending it up the river for that distance, and then so arranging their tracks as to unload direct from the cars to barges or vessels. There can be no doubt that such an improvement would meet with the heartiest approval from shippers and vessel men, as it would obviate much of the trouble which now exists. It would also form quite a large and safe harbor for shipping.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

PERRY DAVIS' VEGETABLE PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

Market Reports.

TORONTO.

From Our Own Correspondent.

JAN. 24.—The extremly cold weather of the past week has again put a stop to all building operations, and as a natural consequence the yards are all quiet. Dealers are patiently waiting for more open weather and a conseqnent resumption of business. But, although retailers are thus compulsory idle, it is not so to the same extent with the wholesale dealers. Stocks are rapidly changing hands and by the opening of the spring all stocks of any magnitude manufactured to the north of this city will be concentrated in the hands of three or four prominent dealers here. The names of those likely to control the market here during the coming summer are as follows :—Messrs. Christie, Kerr & Co., S. & F. N. Tennant, S. C. Kanady & Co., and Donogh & Oliver. The stocks remaining outside of these parties' hands (except such as seek theirs' by way of Chicago) will be be quite trifling in comparison with the probable total cut to the north of this place. Of course there are many smaller mill stocks yet to be disposed of, and it is highly probable that a large portion of such will fall into the hands of the firms above mentioned. Prices at the yards remain firm at last quotations.

MONTREAL.

From Our Own Correspondent.

JAN. 25.—Business has been moderately active and there has been a fair retail trade done during the past two weeks for the season of the year. A number of American dealers have been here and also in Ottawa, making enquiries abont lumber and we understand a good many transactions have taken place in the latter district. The demand for the United States promises to be good this year. The opening prices in Ottawa are just about the same as last year, but they are stiff in one or two grades. We cannot make any change in our list. Prices are steady and maintain their strength as follows :—

Pine, 1st quality, ℔ M	$35 00@40 00
P ne, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00

LIVERPOOL MARKETS.

A. Dobell & Co., of Liverpool, quote the market as quiet at the end of 1882, but this is usually the case at the holiday season. Stocks with the exception of pitch pine are not excessive. There have been sales by private bargain of *spruce deals* as follows : Several cargoes of St. John, N. B., at £7 15s. and £7 10s. ; Halifax at £7 5s., and by auction of St. John, N. B., at £7 7s. 5d. The quotations there are as under : Quebec square white pine 1s. 7d., to 2s. 5d. ; Quebec waney board pine 2s. 3d. to 2s. 8d. ; Quebec red pine 1s. 3d. to 1s. 8d. ; Quebec oak first quality 2s. 10d. to 3s. 2d. ; ditto 2nd quality 2s. 6d. to 2s. 9d. per cubic foot.

CORDWOOD.

During this cold weather cordwood has been moving off very fairly, a pretty large quantity arrived about 10 days ago, since then there have been few importations. The dry wood cut last winter is now being got out of the bush and a good supply is looked for a little further on in the season, meantime prices are well maintained, but unchanged in figures. We quote ex cartage at the depot :—

Long Maple	$7 50
Short "	7 00
Long Birch	7 00
Short "	6 50
Long Beech	6 50
Short "	6 00
Long Tamarack	6 50
Short "	5 00

OTTAWA.

From Our own Correspondent.

JANUARY 10.—Lumbermen of the Ottawa Valley cannot help but feel grateful to Providence for the propitious weather for the manufacture of our greatest natural resource which exists this season. There has been a sufficiency of snow on the limits from early fall, and good roads have consequently been made. A great many shanties, far more than previous years, are operating on the Upper Ottawa, and an enormous quantity of logs and square timber will likely be taken out this season. The rush of men and teams to the woods is about over, and the demand now is small. Sherman, Hurdman & Lord send up a large number of teams to morrow, and Allen Grant has already despatched the amount he requires. The other firms have all about finished sending up labor, and the shanties are now working to their utmost capacity.

IMPROVEMENTS.

A large force of men left a few days ago by the C. P. R. for Black River. They were sent by Government to repair the timber slides at that the place. Extensive improvements will be effected during the winter.

EDDY'S MILLS.

Great rapidity is being made in the reconstruction of Eddy's mills in Hull. The work is carried at night as well as day, by the use of the electric light, as many as twelve lamps being burning nightly. A large number of machinists are employed making the necessary shafting. The pail and tub factory are in operation.

NEW MILL.

R. A. Campbell & Co. are building a new steam saw mill at Lachute, the dimensions being 56x112 feet. The sawing capacity will be about 25,000,000 feet in the season. Inglis & Hunter, of Toronto, are putting in the boilers and engine, and Messrs. Stuart & Fleck, of this city, supply the remainder of the machinery. It will be completed by May next.

LIMIT SALE.

Richard Nagle has disposed of one of his timber limits of 150 miles, on Black River, to Mr. Alex. Fraser, for $158,000.

LATER.

JAN. 25.—A larger force of men than usual are at present employed repairing the different Chaudiere mills. The improvements being effected are more extensive and numerous than in past years. Messrs. Brunson & Weston are having a complete new flume built in connection with their large mill on the Victoria Island. Messrs. Perley & Pattie, and J. R. Booth are renewing their yard platforms, and besides making other necessary improvements. E. B. Eddy has begun erecting his new saw mill on the site of the one which was destroyed by fire, laborers are employed night and day. Up to the present the pail factory is completed, and the new solid stone planing mill is in operation The works will be more extensive than before the late disastrons conflgration. The mill owners are taking extra precautions against fire. Messrs. Ahearn & Soper, electricians, of this city, are placing thermosthats in a few of the mills.

A great quantity of timber is being taken out of the limits this winter. The weather has been very favourable, but bad ice in many places has caused numerous difficulties. Quite a large number of horses have been drowned. A few weeks since reports were freely circulated of the existence, to an almost alarming extent, of small-pox among the shantymen. It has been, however, ascertained that no ground whatever existed for the rumor. The disease has been no more prevalent this season than in other years. Messrs. Fraser & Lereny who purchased Mr. R. Nagle's limits on the Nipissing, have already three shanties in operation. Next season will be a booming one in the saw mills here.

OSWEGO, N. Y.

From Our Own Correspondent.

Trade this week has been brisk ; country dealers having pretty well sold out are buying freely, and report a good healthy trade throughout the country. Sleighing has been good ; farmers and others find a ready market for produce of all kinds, and this stimulates the lumber trade ; collections are easily made ; prospects for more than an average business through the winter are good.

CHICAGO.

The *Northwestern Lumberman* of Jan. 20, says :—The lumber business of the United States and Canada is taking its annual rest. The difference between the condition last January and the one now passing is that now the dormant stage is a little more pronounced than it was last winter. Every well-informed lumberman knows the reason. A degree of overproduction and a shrinkage of values are having their effect. At the same time there is a prevalent feeling, or, perhaps better said, a hope, that next season's trade will be good. All agree that there is no reason why consumption should not be enormous, as the lower range of values sure to prevail will tend to encourage building operations and other uses of timber. For this reason preparations are being made for a heavy output. The supply will be more abundant than ever before, and the dealers are getting ready to handle largely, and take the chances of profit or loss. One thing they consider certain : conditions for buying bulk lumber will be more favorable next year than they were last. As to selling, every smart handler thinks he is equal to that emergency, and each one thinks he is as smart as anybody else.

The large surplus on hand is having its effect on the trade. The general demoralization of price lists in the interior gives each holder of stocks a chance to do a little quiet work on his own account, and often he is doing it. Emissaries are on the road and burdening the mails, and it is safe to conclude that the offers made in these ways look brilliant and fascinating to retail dealers and contractors. Cutting of price lists is, no doubt, more lavishly done in the interior than at the east ; but even in the more steady-going sections of the country it would not require much persuasion to obtain concessions on considerable lots. The movement is, however, so light that wholesale holders do not get the opportunity to show how generous they would be.

Reports from Albany and New York are more spiritless than for months past. The cold and continuous winter weather has cut off consumption, and the export demand is less than it was a few weeks ago. Spruce is fighting a battle with yellow pine in New York and vicinity, preventing any improvement in values that might be seen on account of the cessation of receipts. At Albany dealers are waiting for customers.

Receipts and stock on hand of lumber and shingles, etc., for the week ending Jan. 18, as reported by the Lumberman's Exchange :—

BOSTON.

Cotton Wool and Iron of Jan. 20, says :—As is usual at this early period of the new year, the general market is quiet, with a light demand. The same condition of affairs seems to prevail throughout the country. The outlook in this vicinity is for a good steady trade the coming season, probably equal to that of the past year. Although the market is now so dull, the general expectation is that prices will not be much lower when trade starts up. Eastern lumber is arriving here in a limited way, with prices more or less nominal. Western lumber is in limited receipt, and stocks generally seem to very well in hand. Considerable walnut, however, is yet held in first hands, with ash and cherry pretty well reduced. Western pine is quiet, with the demand only for present wants. Something prime is dull and rather in buyers' favor.

BRISTOL.

The *Timber Trades Journal* of Jan. 6, says : Messrs. King Brothers' January circular contains the following remarks :—The timber trade during the past month has beeu of the most uusatisfactory description, and what little demand existed previously appears to have been amply satisfied. We trust that with the new year a change for the better may take place. Quebec goods.—Yellow pine timber of good quality is in fair demand. Birch, ash, and elm have been in fair demand at slightly increased prices. Walnut—No importations. Deals are not now iuquired for, buyers having obtained

their stocks. Staves continue in request. New Brunswick goods.—Spruce deals are a trifle easier in price, yet the demand is but languid. Stocks are sufficient. Pine deals.—No arrivals. Birch remains quiet.

GLASGOW.

The *Timber Trades Journal* of Jan. 6, says: Business is at a stand this week, the public works being closed for the New Year holidays. Imports, which are very light, include a cargo of pitch pine at Greenock. The stock of this wood on hand is altogether about 21,000 loads. There was a slightly heavier stock last year. The activity in the shipbuilding trade gives promise of a large consumption. As regard stocks on hand of Quebec log timber, particulars of wich will be shown in a future issue, they will show, taken altogether, a decrease compared with the total of a year ago to the extent of over 13,000 loads.

LIVERPOOL.

The *Timber Trades Journal* of Jan. 6, says: As customary during the holiday time there has been very little business done, nor is it likely that there will be any liveliness displayed until the mahogany sales announced to take place at the end of this week.

The ordinary quietude for which every one looks during this season has not yet been affected in any visible degree by the presence of those buyers who often come into the market immediately the year turns, although several have put in an appearance; but the effects of their purchases are not sufficiently marked to make them worthy of particular comment.

Speaking generally, the import has been upon a moderate scale, but that of spruce deals has been beyond the requirements of the market, and as the demand during the past month has been below the customary limit, stocks of this article have increased to an extent of about twenty-five per cent. over those of last year at this time.

Latest advices from St. John, N. B., however, point out that no ships are there under charter, and that shippers are unwilling to pay the rates demanded, owing to the low prices realized for spruce deals in this country; therefore vessels are leaving that port and proceeding further south in search of more profitable employment, one having left for Norfolk and one for New York, where better freights are being offered for grain.

LONDON.

The *Timber Trades Journal* of Jan. 6, says: Colonial goods are very moderately represented in the dock stocks, and although the import of 1881 was not by any means a heavy one, that of the past twelve months has been to London, at any rate, considerably less, and at no time last season have the dock stocks of Quebec goods been equal in quantity to those of the previous year.

Broad pine in good quality is quite a rarity at the public sales, and is scarce, we understand, in the market. Prices have not sympathised with the low stocks, though most of the pine stocks, we believe, are now held in first hand.

Spruce, also moderately represented in stock here, does not go off so briskly as was anticipated. The large stocks of other descriptions of whitewood with which it comes into competition no doubt hinder any advance in value, while the trade generally is not active enough to give any fresh stimulus to the demand.

We do not hear of any fresh business actually effected for the new year in the deal trade yet, though several offers have been received by the shippers; the prices, however, have in the most cases presented such a wide difference compared with their quotations that a refusal has been the result. In flooring boards, however, sales continue to be made, and the likelihood of the demand being well sustained is more than probable, the greatly reduced stock here operating favorably on the market.

WINNIPEG TRADE.

The *Northwestern Lumberman* says:—The demand for lumber here during the past season was good, and there was about 40,000,0000 feet brought here, about one-half of which came from St. Paul and Duluth, and the other half divided between Ontario, Lake Winnipeg, and Lake of the Woods districts. There has been about 10,000,000 feet manufactured here at three mills, the logs for which were brought from Minnesota. The mills have each a capacity of 5,000,000 feet a season, but did not get to work until very late. Business is very quiet here now, as very little building can be carried on here on account of cold weather, although there are some buildings in progress. It is impossible at present to say what amount of building will be done the coming season, but our impression is that there will not be as much as there was last, which is put in round numbers at $5,000,000. The winter operations on Lake Winnipeg are said to be about 50,000,000 feet, which is all spruce and tamarack. I have not heard any estimate made of the quantity of timber in that district. In the Lake of the Woods district there is said to be about the same quantity being got out. It is red and white pine, with some spruce and tamarack, but it is mostly of the former. The wages paid are about $30 per month, and board. It is expected, now that the Thunder Bay branch of the Canada Pacific railroad is open, that a considerable quantity of timber will be brought from Georgian Bay by that route, but as the quantity being manufactured in the two sections I mention is so large, I do not think that there will be much brought in that way.

The Australian Trade.

Messrs. Gemmell, Tuckett & Co.'s last report received, and dated Melburne, November 22nd, says:—The consumption of timber during the month has been fully up to the average, but the large importations from Oregon, Sweden, and Norway have had a depressing effect on the market, and prices are lower. American lumber.—Sales during the month light, but prices realized for the parcel ex St, Patrick show an advance, Michigan clear bringing $18 to £18 5s., w. p. shelving, £10 5s.; w. p. t. and g. ceiling, £9 12s. 6d. per m. super. The trade hold light stocks, and prices will improve.

Northwest Lumbering.

From Mr. R. J. Short, who has the contract for supplying the C. P. R. with ties and lumber, the Winnipeg *Sun* learns the following facts regarding the operations at the Lake of the Woods:—Mr. Short at present has 160 men and is constantly adding to the number. In gangs of 40 they operate in much the same manner as Ontario lumber gangs. Choppers get $30 per month and board, and hewers $50. Last year up to the 23rd December 125,000 ties were taken out besides a large number of telegraph poles. The ties are principally red and white pine and tamarac, which are much harder than similar woods growing in Ontario, and are said to be as durable as cedar. Of logs 5,000,000 feet have been dressed already, and they expect to have 10,000,000 before the season is over. The quantity of lumber in that part of the country, Mr. Short says, is nothing to boast of.

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and Account Books of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

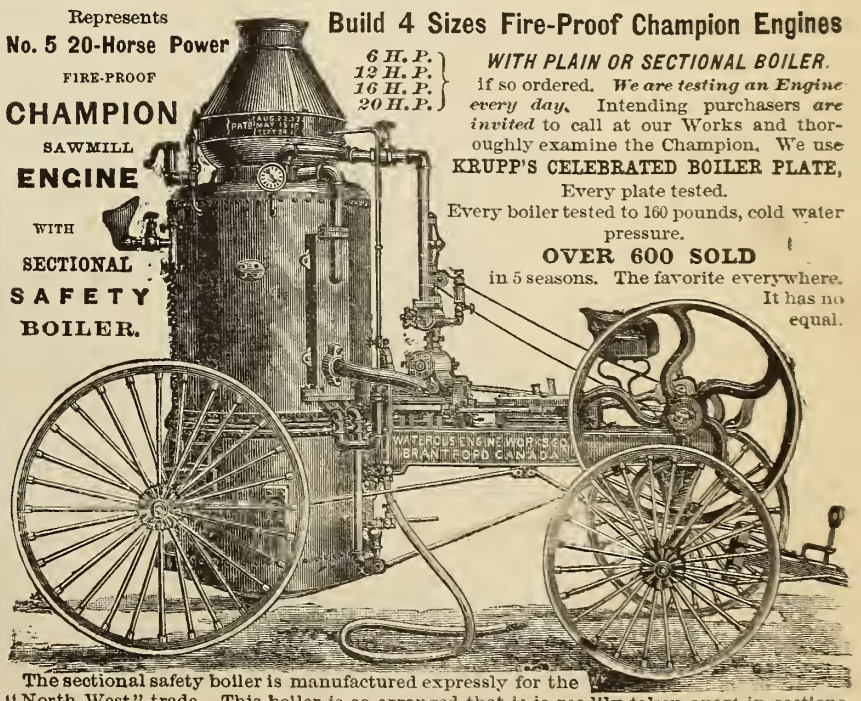
in 5 seasons. The favorite everywhere. It has no equal.



The sectional safety boiler is manufactured expressly for the "North West" trade. This boiler is so arranged that it is readily taken apart in sections enabling purchasers to clean thoroughly every part of it and prevent burning out. *We know from experience this is absolutely necessary with the alkaline waters of the great Western prairies.* Largely used by the Pacific Railway Company and all the large Colonization and Ranche Companies.

FORESTRY.

We take the following from the report of the committee charged with the oversight of fruit and forest planting at the agricultural college, Guelph :—

FORESTRY.—The several clumps of black walnut, European larch, butternut, sugar maple, and of mixed trees, are doing fairly well, except that the group of larch from some cause did not succeed, probably owing to the dry character of the soil in which they were planted. There is, however, a sufficient number of young larches in the nursery plot to supply all the vacancies. It was found desirable to use the field in which the clump of ash had been planted as an experimental grain plot. On this account they have been taken up and will be set out in another field next spring. The experiment of growing black walnut with and without cultivation is already demonstrating the fact that the growth is much more satisfactory where clean cultivation with occassional stirring of the soil is practiced. The nursery plantations of young trees will supply a considerable portion of the trees required for the proposed enlargemont of existing clumps, and by keeping up a constant succession of nursery plantings the required trees for foresting purposes can be always at hand in the best possible condition for transplanting.

THE ARBORETUM.—In attempting to extend the Arboretum the Committee found that it was absolutely necessary to re-arrange the front grounds, and to provide some definite and well arranged plan that harmonized with the grounds and buildings on which to base all future work. Hitherto no such plan had been prepared, hence it was impossible to proceed systematically with the extension of the Arboretum in a manner that would subserve the purposes of education and at the same time adorn the grounds and produce the proper landscape effect.

After some correspondence we were so fortunate as to secure the services of the most eminent landscape gardner in America, Mr. Charles H. Miller, of Fairmount Park, Philadelphia. He visited the college in April last, and examined the grounds thoroughly in company with yourself, the Committee and architect. He has now prepared and placed in our hands a most admirable plan of all that part of the grounds ; this plan has been approved of by yourself, and when the planting and grading shall have been completed in accordance therewith, we believe that the college grounds around and in front of the buildings will be all that can be desired. Work has been already begun, and the grounds immediately in front of the main building laid out in conformity with the plan, and the requisite carriage ways to the recently erected residences of the Professor of Agriculture and of the Bursar provided. Already a great improvement in the appearance of the grounds is manifest, a pleasing foreshadowing of the results to be achieved when the whole work is once completed and time enough shall have elapsed to produce the growth necessary to give due effect to the whole. Ample space is now set apart for the planting of an extensive aboretum, which your Committee intend shall be grouped in such a manner as to be convenient for study by the young men and serve as illustrations in teaching, and at the same time these groups will be so placed as to give the best landscape effects.

THE SEED BEDS.—With a view to giving a supply of young trees for future planting, and to afford at the same time instruction in the raising of forest trees from seed, a number of beds were prepared and sown with tree seeds. As was to be expected some of these seeds failed to germinate the first season, and after lying dormant in the ground for a whole year, came up in the second spring. From these beds a goodly number of some varieties of trees and shrubs will be obtained. Some of the kinds sown have apparently failed altogether, thus affording lessons to the students from failure as well as success.

FUTURE OPERATIONS.—We have made arrangements with the Professor of Agriculture for a half acre block in the Experimental Field, which it is our intention to surround with a hedge formed from a variety of hedge plants, for the purpose of showing a sample of hedge formed from each. This will afford both students and visitors an opportunity of seeing the adaptability of each for hedging purposes. The enclosed plot will be devoted to nursery beds for the growing of young trees taken from the seed beds or procured by purchase, until they have attained sufficient size to be removed to permanent situations. It is also intended to set out in the spring two or three additional clumps of forest trees, one of white ash, one of American elm, one of mixed evergreens, also to complete the group of European larch, and extend that of Sugar Maple.

In the orchard all vacancies will be filled up, and the acre of ground recently purchased planted out so as to complete that portion ; and such other varieties added as may be desirable for the purpose of testing their adaptation to our climate. Some additions will also be made to the plantation of gooseberries currants, raspberries, and strawberries, in order to furnish a sufficient supply of these fruits for the use of the college, a large part of which will be taken from the existing plantations, particularly of raspberry and strawberry. Some new varieties of these fruits and of grapes will also be set out in the spring together with a few mulberries, so that the work of testing these may keep pace with the progress of horticulture elsewhere.

In conclusion, your committee would say that such progress has been made in the department of fruit culture and forestry during the short time that has elapsed since you confided these to our direction as we trust will be satisfactory to you, both in the amount of work done and in the economical manner in which it has been accomplished. In a work of this kind great results cannot be achieved in a single season, yet, even now some fruit is being gathered, some improvements we think are to be seen, and these, we believe, will increase in progressive ratio as the years roll by until the results shall be seen in an abundant supply of fruits, of all kinds suited to the climate, sufficient to meet all the wants of the college, both for consumption and comparison ; and groves of trees, and groups of specimens of every variety of tree and shrub shall give beauty to the landscape, and afford means of instruction in all that a well informed yeoman can wish to know of the character and uses of the forest productions of his native land. On behalf of the Committee, D. W BEADLE, Secretary.

LIVERPOOL TRADE.

LIVERPOOL, Jan. 2.—James Smith & Co.'s circular contains the following :—There has been an increased import of white pine as compared with last year, but this has been less than the consumption, so that the stock of all kinds is still light, say 684,000 feet, against 770,000 cubic feet. Red pine is heavy in stock, and the consumption has been small. There have been no fresh arrivals. Ash is in good demand, and the stock is moderate. Elm has come forward freely, but the consumption continues good, so that the stock will be all required before the new import commences. Walnut is in fair request ; the supplies have been somewhat heavy, still prices are firm. First-class large wood, *via* New York, has been sold at 6s. 4d. to 7s. 4d., averaging 6s. 9d. per cubic foot, and smaller wood at 5s. 6d. to 6s. per foot. Oak has gone into consumption on a reduced scale, and there is an ample stock. Sales have been made of several parcels at from 2s. 10½d. to 3s. per cubic foot. Oak planks are in fair demand and prices are without change. Birch has been in good request, but prices have latterly given way, owing to the large arrivals. Halifax wood has been sold at 16½d. per cubic foot, and maple at 13½d. per foot. N. B. and N. S. spruce deals : The import has been excessive, namely, 11,100 standards against 4,255 standards, and there having been no corresponding increase in the consumption, the stock has become heavy, viz., 22,714 standards, against 16,653 standards at this time last year. At the date of our last issue prices were at about £7 15s. per standard for St. John deals, but by the middle of December the prices obtained at auction were £7 7s. 6d. per J. H. McLaren, from St. John ; £7 7s. 2d. per Finn, from Musquash ; £7 8s. 2d. per Hvideern, from Musquash ; and £7 3s. 10d. per Tatay, from Parrsboro' ; and a week later the cargo per Guldfaxe, from Oak Bay, averaged at auction £7 5s. 3d. per standard. By private, sales have been made from £7 6s. 3d. and £7 5s. for Halifax, and £7 11s. 3d. for Miramichi. Pine deals have been sold at £13 15s. for first quality Miramichi, and £9 for second quality ; the stock is moderate. Quebec pine deals are moderate in stock in spite of the increased import, as the consumption has been continued on a large scale. A parcel of bread deals, 11 in. and upwards, realized £25 15s. for 1sts, £18 for 2nds and £12 for 3rds. Quebec pipe and puncheon staves are rather dull of sale ; the stock is not heavy. No sales have been reported. Palings have been sold at 65s. per mille for 4½ feet. Laths and lathwood are without change.

Preservation of Railway Ties.

Some interesting data are published showing the relative value of different methods of injecting railroad ties. On the route from Hanover and Cologne to Minden, for example, the pine ties injected with chloride of zinc required a renewal of twenty-one per cent, after a lapse of twenty-one years ; beech ties injected with creosote required a renewal of forty-six per cent after twenty-two years' wear ; oak ties injected with chloride of zinc required renewal to the extent of about twenty-one per cent after seventeen years ; while the same kind of ties not injected necessitated fully forty-nine per cent of renewals. The conditions in all these cases were very favorable for reliable tests, and the road bed was good, permitting of easy desiccation ; the unrenewed ties showed, on cutting, that they were in a condition of perfect health. On another road, where the oak ties were not injected, as large a proportion as 74·48 per cent had to be renewed after twelve years ; the same description of ties injected with chloride of zinc required only 3·29 per cent renewals after seven years, while similar ties injected with creosote involved, after six years, but 0·09 per cent.

A Vast Viaduct.

The great Linzua viaduct on the branch road of the New York, Lake Erie & Western line, near Alten, McKean county, Pa., is called the highest structure of its kind in the world. It is 2,052 feet in length, and is supported by 20 towers, each composed of four wrought-iron columns, with the requisite bracing. The roadway is laid on latticed girders of 61 feet span, and the cross-ties are eight inches apart. On each side of the rails are heavy, square timbers laid parallel with the track, which would hold an engine from going over into the abyss if it were to jump the track. A passageway on either side, laid with yellow pine and and secured by a railing four feet high, enables pedestrians to pass over leisurely and view the scene from this great elevation. The bridge in the centre is 302 feet in height. About 4,000,000 pounds of iron were used in its construction, and the entire cost of the structure was nearly $300,000.—*Northwestern Lumberman.*

Kentucky Opportunities.

The *Northwestern Lumberman* says :—A northern gentleman who had been through Kentucky, writes about the Cumberland mountain region as follows : The hills are overspread with a splendid growth of basswood, poplar, beech, maple, oak, chestnut, Norway pine, cedar and hickory. These lands have never been opened, however, and the timber stands and rots. I was offered 100 acres of Norway pine, that would cut 10,000 feet to the acre, for $100. Stumpage is worth almost nothing. Something is done manufacturing stave bolts for the numerous distilleries, and a few saw-mills, which think they do something wonderful when they saw 5,000 feet a day, are scattered through the hills. There is need here of northern enterprise and money, and the time is seen coming when there will be plenty of both. A dozen railroads are projected, and some are being built now which will carry to market this lumber.

Miramichi Notes.

The St. John, N. B., *Telegraph* says :—Gabriel Yerxa has six camps established on Burnt Hill Brook and its branches ; at these camps he has 150 woodmen and 30 pairs of horses. He expects to get out 7,000,000 feet of lumber this season. Harry Turnbull has two camps on Clear Water, and his product will be about 2,000,000 feet. Messrs. Yerza and Turnbull's lumber is under contract for Guy, Bevan & Co. Timothy Lynch has a very large force on McLean Brook, McKiel and South West Branch ; his cut is estimated at 12,000,000 ; his depot camp is on McKiel, where he has 15 pairs of horses and 60 men. M. Welch expects to cut about 4,000,000 at the head of the South West. William Richards is operating heavily along the South West, and Charles Smith is cutting a great quantity on the Todd block. The snow here is about two feet deep.

DURING the year 1882 there was shipped from the port of Jacksonville, Fla., 68,041,546 feet of lumber, as compared with 58,837,451 in 1881, and 41,719,255 in 1880, an increase in 1882 over 1881 of 9,204,095, and over 1880 of 26,322,291. It will thus be seen that, while a fair increase has been made this year, the great bound forward in lumber production in the country tributary to Jacksonville was made in 1881.

FORTUNATELY Valvular disease of the heart is not very common, its disturbed action may be due to indigestion, liver irregularities &c. A Stomach disturbed with wind, or indigestable food will cause pain and fluttering by crowding on the nerves of the heart. Burdock Blood Bitters will speedily remedy all such difficulties.

GOOD ADVICE.—If our readers will accept proffered advice, they will always keep a bottle of Hagyard's Yellow Oil at hand for use in emergencies, such as Burns, Scalds, Wounds, Lameness, Croup, Chilblains, Rheumatism and all varieties of aches, pains and inflammations. It will ever be found reliable.

MR. THOMAS W. RACE, Editor and Proprietor of the Mitchell *Recorder*, writes that he had a prejudice against Patent Medicines, but being induced to try Burdock Blood Bitters, for Billiousness that occasioned such violent headache and distress as to often disable him from work. The medicine gave him relief, and he now speaks of it in the most favorable terms.

CONSUMPTION

POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,

20L24 360 Fulton Street, Brooklyn, N. Y.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

LOGS BY RAIL.

The *Lumberman's Gazette* says :—Ten years ago the idea of hauling pine logs by rail would not have been entertained as a profitable undertaking, but of late years it is a recognized industry. Aside from the short lines that are scattered throughout the pine forests of northern Michigan, logs are hauled in great quantities by railroads to terminal points. The F. & P. M. railroad handles pine logs extensively, the bulk of the product coming to the Saginaw river. The Mackinaw division of the Michigan Central has handled a large quantity of pine logs during the past two years. Tawas & Bay County road hauls logs to Tawas, and the Saginaw Bay & Northwestern haul a good many logs to Saginaw Bay, which come to Saginaw river mills.

During the month of December the Flint & Pere Marquette hauled 11,964,532 feet of logs of which 5,040,370 feet came direct to the Saginaw river. During the year 1882 this road hauled 95,294,620 feet of logs of which 46,226,419 feet came direct to the Saginaw river, and 29,932,530 feet were distributed between Midland and Averill. Of these 12,595,870 feet were manufactured at Midland and 17,336,660 feet came through the Tittabawassee booms to Saginaw river mills. The balance of those not coming to the points named went to Manistee. The record of this road in log hauling during three years, shows as follows :—

	Feet.
1880	87,475,546
1881	105,296,530
1882	95,294,620

During November the Saginaw Bay & Northwestern road hauled 5,305,782 feet, and in December 3,592,165 feet making a total for the year of 86,030,768 feet. The Tawas and Bay County road hauled during the year 38,436,570 feet, and the Mackinaw division of the Michigan Central 60,000,000 feet. The aggregate for 1882 shows as follows :—

	Feet.
Flint & Pere Marquette	95,294,620
Michigan Central	60,000,000
Saginaw Bay & Nortbwestern	86,039,768
Tawas & Bay County	33,486,570
Total	279,820,858

A Big Crop.

The *Lumberman's Gazette*, of Bay City, says : Reports from the pineries in almost every direction are almost unanimous to the effect that there will be an enormous crop of logs put in this winter. In some localities there have been complaints about the difficult hauling and skidding, but this difficulty has not been insurmountable, and the late cold weather has about overcome it, and logs are not only being cut at a lively rate, but they are being banked with all possible dispatch. Every available team which can possibly be secured is being rushed to the pineries, and the country districts are being scoured for horses to put on the log roads. During the past week or ten days, these teams by scores have passed through the city headed for the logging districts ; therefore present indications are to the effect that there will be no shortage in the log crop next season, whatever else may betide the lumber industry.

Preserving the Forests.

The speech from the throne at the opening of the Quebec Legislature contains the following paragraph :—The deliberations of the Forestry Congress, held at Montreal in September last, have had the effect, in a marked manner, of directing attention to the important subject of the preservation and renovation of our forests. My Government are considering the most effectual method of attaining such a result, and a bill will be submitted to you to limit the destruction of our woods and forests without diminishing the public revenue.

Worms in Wood.

Worms in hardwood are not an uncommon nuisance. Oak, ash and other lumber is often thus invaded, and there is danger of destruction to wood from that source unless great care is taken in felling, handling and storing timber, even after it has been worked into shape and placed on the market. Cases have been known where the worms have worked their way into white oak posts in such a way as to be unnoticed till the timbers had been painted, and the wood-dust exposed their presence, after which they made their appearance in great numbers. They bore under the surface in a circuitous way, and not to any great depth. Carbon oil destroys them, and sometimes it is regarded as a wise precaution to coat timber with that material.—*Northwestern Lumberman.*

THERE are over 100 rafts locked in the Clarion river, Pa., by the ice. Lumber towns along the river have been injured to the estimated extent of $250,000.

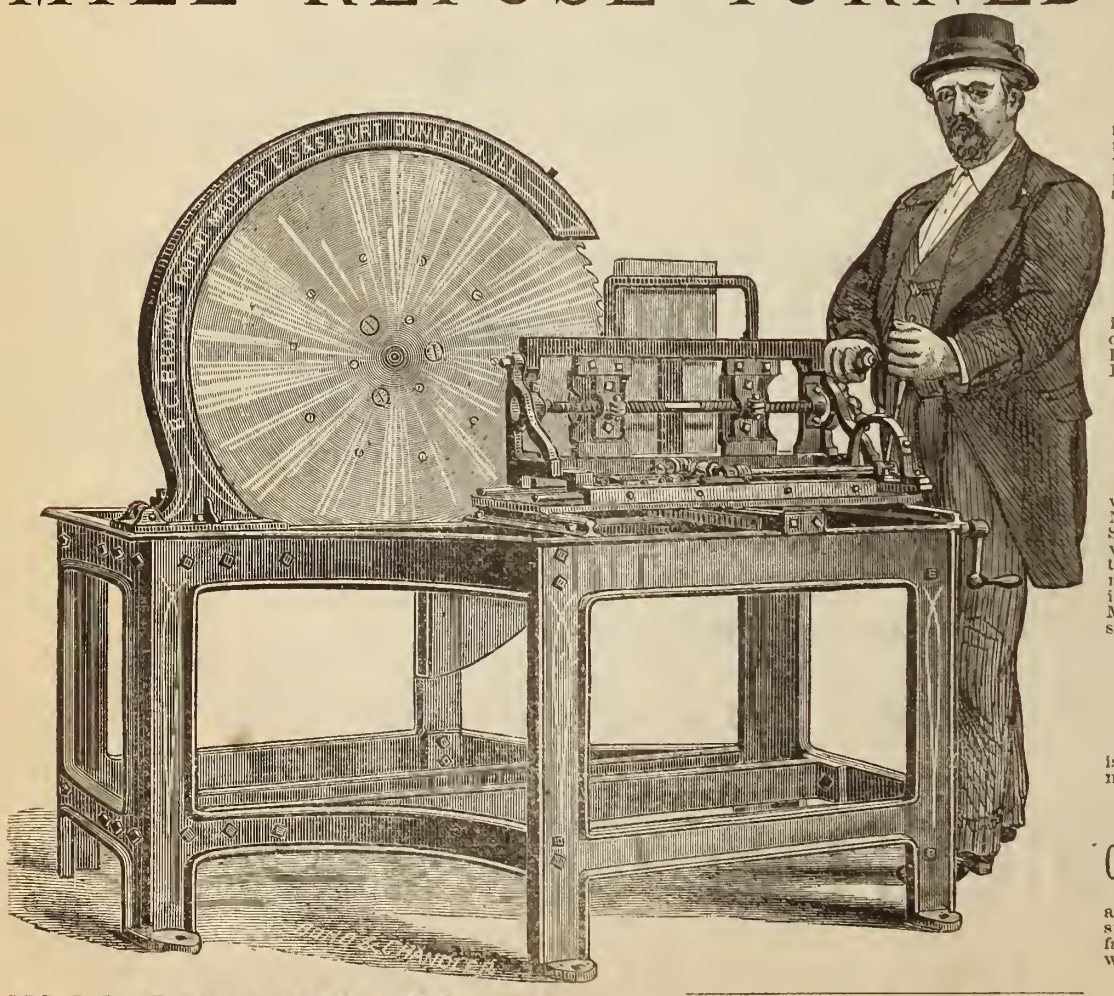
MILL REFUSE TURNED INTO MONEY



BY THE USE OF

Brown's Patent Spalt and Shingle Mill,

for making Shingles, Barrel Heading, Box Stuff, &c., from spalts, board trimmings, slabs, and mill waste generally, turning material otherwise worthless into valuable products. I have made arrangements with the patentee to manufacture and sell for the Dominion; have made and sold a good number of these machines which are giving excellent satisfaction and can give the best of references.

Our Steam Feed for Circular Mills,

is now the Best Feed where Steam is the motive power. It is easily operated, is simple, rapid, and seems never likely to wear out; sixteen 16 ft. boards, or eighteen 12 ft. boards, have been cut by it in one minute. It is the established feed for steam mills; I make a specialty of its manufacture; will guarantee satisfaction.

Our Patent Twin or Span Circular,

with Steam Feed for Steam Mills, and Rope or Rack Feed for Water Mills is fast coming into general estimation and is used in place of Gang Slabber in our best Canadian Mills. One of our Span Circulars which will slab logs 25 inches in diameter down to 7 and 8 inch stocks, will do the work of three slabbers, with an immense reduction in first cost, running expenses and labour. Two of these machines can be seen at work in Messrs. Gilmour & Co's Mill, Trenton, and Georgian Bay Lumber Co's Mill, Waubaushene and Port Severn. I am also introducing a new style of Mill Engine, neat, substantial and simple, with Corliss Frame and Balanced Valve, all carefully designed and honestly made.

Covel's Automatic Saw Sharpener,

is now well-known and highly appreciated, when placed at work in the mill it sings out its own praise; I keep it constantly on hand, ready for immediate shipment.

Our Standard Circular & Gang Mills & Machinery,

are too well known to need any reference, any further than to say that I spare no pains or expense to have my work all first-class and give satisfaction, and as I make Heavy Saw Mill Machinery a specialty, any party wanting a First-class Mill will find it to their advantage to give me a call.

WILLIAM HAMILTON, Peterborough Foundry and Machine Works, **PETERBOROUGH Ont.**

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

SUBSCRIPTION $2.00 PER ANNUM.

VOL. 3. PETERBOROUGH, ONT., FEBRUARY 15, 1883. NO. 4.

CALCASIEU, La., is placing yellow pine lumber in the yards at Laredo, Texas, and selling it profitably at $32 per thousand.

THE Wisconsin Central road recently put into use a new style platform car, arranged particularly for carrying lumber and long timber. Its capacity is 30 tons, and it has three trucks—one under the centre.

THERE is an unusual demand for "second growth" pine in Addison county, Vt., the dealers buying all that is to be had. The bulk of it is for the Massachusetts trade, and much of it is being sawed "through and through" at the local mill, being then shipped for use in box making.

NASHVILLE, Tenn., has one of the largest wooden pump factories in the world. Fifteen hundred pumps can be bored in a single day. There are four engines and three circular saws. A box factory is attached. The company handled 9,000,000 feet of lumber last year, worth $207,000, and has now on haud several million feet of nice lumber. The works employ 215 hands and are lighted by electricity.

VALUE OF HARDWOOD.

The *Lumberman's Gazette* of Bay City, Mich., says:—On more than one occasion we have alluded to the value of hardwood timber lands is this state, and maintained that no true estimate had yet been put on them. In order to give our readers some conception of what these lands are really worth, it may be stated as an admitted fact that hardwood lands are always estimated at a much higher value than pine lands for agricultural purposes; but this does not comprise the extent of their value. The timber is rapidly coming into demand and favor, and should be protected and saved from destruction further than the absolute necessities of each particulor case demands, as in a few years the timber will be of inestimable value; or at least to the extent of many times the worth of land on which it is standing.

HEAVY OPERATIONS.

The Chigago *Northwestern Lumberman* says: The Roscommon Lumber Company, of which S. B. Barker, af this city, is president, and C. B. Field, of Grand Haven, Mich., general manager, organized last season, has taken hold of logging this winter with much vigor. The company owns 375,000,000 feet of standing pine, tributary to Houghton lake, Roscommon county, Mich., and has built 12 miles of logging railroad from the lake into the heart of this great belt of timber, which is regarded as one of the finest bodies of standing pine in Michigan, as is evident from the fact that last fall the company sold 12,000,000 feet of it for $12 a thousand for all over 12 inches, and $7.50 for all under that size. The company is now putting in 150,000 feet of logs per day over its railroad. The track of the road is iron, with small T rails, and is well ballasted with good ties. The gauge is three and a half feet. The track is expended out into the lake by means of piles and stringers. The cars will be run winter and summer, and the track extended further and further into the woods as it shall become necessary to reach the pine. The company has nó mill, and consequently the logs will be put on the market.

AMERICAN FLOORING.

The London *Timber Trades Journal* says:—Among the fresh introductions of the new year if we had to report a cargo or two of cheap pine flooring ready prepared as shipped from one or other of the American ports, there might be cause for the Norwegian flooring trade to feel alarmed, for there is really no reason why pine flooring should not be extensively used here. In the States white pine is preferred to what they term yellow (pitch pine), and, when painted over, the floors become watertight, and will wear for years. There is less shrinkage about yellow pine than ordinary deal, as long as it is kept dry, which the paint insures, and it will stand as long as any other kind of wood. Irrespective of pine, however, the American plan of covering their floors with a coating of paint is one that should recommend itself to all householders here, on the score of being much cleaner and more wholesome than the present system. Water spilt on the carpet penetrates through the upper rooms and discolours the ceilings of those underneath, but if the boards were well painted when first laid down this would not happen. When a house has to be scrubbed down the soapsuds and dust rubbed into the floors of the ordinary English house must contrast unfavorably with that of a house that has undergone a similar cleansing in New York or other cities of the States, where painted floors are almost universal.

LONG LEAVED YELLOW PINE.

(*Pinus Australis.*)

This term is but imperfectly understood, and is just now greatly misused in the sale of southern lumber in the northern market. It is not strange that shippers of lumber should take advantage of the reputation of Georgia, Alabama and Florida pines, and attempt to sell everything in the shape of Southern pine lumber as "long leafed." But this is so criminally unjust to these states that we feel compelled to refer our readers to the United States census of 1880 (10th census), showing the facts upon this subject. We do this with no desire to make invidious comparisons, but simply to set our timber interests right before the world.

Georgia, by her greater enterprise, has already proven the excellency of her lumber, and gained a world-wide reputation.

Alabama, however, has standing to-day over 2,000,000,000 feet more of the same long leafed pine than Georgia; in addition to which she has over 2,000,000,000 feet of short leafed pines (Pinus mitis). Florida, North Carolina and South Carolina have all long leafed pine. Arkansas, which is set down as having more pine than any of the southern states, except Texas, has all short leafed pine (*Pinus mitis*), with a considerable mixture of Loblolly (*Pinus Taeda*), but she has no long leafed pines. This being the true state of facts, it is highly unjust for dealers and manufacturers at St. Louis and other Mississippi river points to force their inferior pines upon the northern market on the reputation of the genuine long yellow leafed pine. We only ask each dealer to note what we say and investigate for themselves, and we also wish land explorers who contemplate timber investments or for milling to give these facts the weight to which they are entitled, and you cannot fail to see that our lumber should be classed far above the "short leaved."—*Gulf Stream.*

POWER OF NAILS AND SCREWS.

The following resume has been made of experiments upon the adhesive power of nails and screws: Haupt, in his "Military Bridges" gives a table of the holding power of wrought-iron rod nails, 77 to the pound, and about three inches long. The nails were driven through a one-inch board into a block, and the board was then dragged in a direction perpendicular to the length of the nails. Taking a pine plank nailed to a pine block with eight nails to the square foot, the average breaking weight per nail was found to be 380 pounds. Similar experiments with oak showed the breaking weight to be 415 pounds. With 12 nails to the foot square the holding power was 542½ pounds with six nails in pine 463½ pounds. The highest result obtained was 12 nails to the square foot in pine, the breaking weight being in this case 612 pounds per nail. The average strength decreases with the increase of surface. Tredgold gives the force in pounds required to extract three-penny brads from dry Christiana deal at right angles to the grain of the wood as 58 pounds. The force required to draw a wrought-iron six-penny nail was 187 pounds, the length forced into the wood being one inch. The relative adhesion when driven transversely and longitudinally, is, in deal, about two to one. To extract a common six-penny nail from a depth of one inch in dry beech, across grain, required 167 pounds, in dry Christiana deal, across grain, 187 pounds, and with grain 87 pounds. In elm the force required was 327 pounds across grain, and 257 with grain. In oak the figure given was 507 pounds across grain. From further experiments it would appear that the holding power of spike nails in fir is from 460 to 730 pounds per inch in length, while the adhesive power of screws two inches long, .22 inch in diameter at the exterior of the threads, 12 to the inch, driven into one-half inch board, was 790 pounds in hardwood and about one-half that amount in soft wood.—*The Woodworker.*

FOREST PROTECTION.

Recently two daily papers, published in New York, had editorials on the same day that read very much alike. They both started to discuss the question of duty on lumber, and ended by saying that it is a great necessity just now that our forests should be protected. It is easy to admit that a discussion of the tariff question would naturally lead to a mention of forest protection, but the conclusions of these editorials were so similar that it was not difficult to imagine that one brain suggested both. There is a great deal said nowadays about the protection of our forests, and many are of the opinion that it is the talk of philanthropists who have the good of the people at heart. That, looking down the dim future, these philanthropists see a want of trees, and will endeavor to supply that want by complying with the old adage, "a stitch in time saves nine." The *Lumberman* has known for some time that certain gentlemen were trying to create public opinion by getting as many of their communications as possible inserted in the newspapers, these communications vividly portraying the wicked way in which our forests are destroyed by axe and fire, and suggesting that such slaughter should be stopped. The *Lumberman* has also known for some time that pure philanthropy is not the only foundation this concerted move rests upon. These gentlemen, to use a term known in politics, are laying pipe. They are not looking so much after the welfare of coming generations as they are after offices. They hope that congress will make a big appropriation for the protection of forests, and that they will handle and absorb the appropriation as a remuneration for services in doing what little they may in the way of preventing forest fires, and the unnecessary destruction of small trees. Whatever reason there may be in the arguments of these gentlemen, their plans may meet with some opposition from the fact that the most lovable side of a man's nature is not that side that yearns aloud for the creating of an office, and theu avows that it would suit him mighty well to fill the office, and goes to work by "playing" the newspapers to bring about that end. That forest protection in certain directions is needed admits of no question, and when, if ever, we have laws for that purpose, the manipulating of them should be placed in competent hands. The bungling of late in connectiou with forestry ought to answer for some time.—*Northwestern Lumberman.*

DISTRICT OF NIPISSING.

We take the following from the annual report of the Ontario Commissioner of Crown Lands, as to the timber berths north of French River :

TORONTO, ONTARIO,
4th December, 1882.

SIR,—I have the honor to report that in obedience to instructions received from the Crown Lands Department, and dated July 14th, 1882, I proceeded to the field and made a survey of certain timber berths north of French River, that is to say, I ran the south boundaries of timber berths numbers sixty-seven, fifty-nine, fifty-one, forty-three, thirty-five, twenty-seven, nineteen and eleven ; the bonndary lines between numbers forty-three and fifty-one, between nineteen and twenty-seven, between twenty and twenty-eight, and between twenty-one and twenty-nine. I also produced the line from the southeast angle of number eleven due east to strike French River, and ran a line due south from the south-east anglo of number twenty-seven, to the township of Blair ; the total number of miles run being seventy-seven miles ten chains. The lines were all run astronomically, and corrected from time to time during the progress of the survey, by observations of Polaris at its eastern elongation ; the chaining was done with a Chesterman's steel tape.

I began my survey at the southwest angle of berth number sixty-seven, being a point on Salter's meridian line at the distance of sixty chains seventy-seven links south from his eighteen mile post, and running due east astronomically, at five miles one chain and forty-two links, I established the southeast corner of timber berth number sixty-seven ; six miles further on established the southeast corner of number fifty-nine ; and made each succeeding berth six miles wide, excepting number twenty-seven which was made seven miles. From the southeast angle of number fifty-one I ran north between forty-three and fifty-one, to the southwest angle of berth number forty-four, where I found an old post marking the position of said southwest angle : this line between numbers forty-three and fifty-one came out eighteen chains fifteen links short of the six miles. The line between nineteen and twenty-seven, etc., came out on Salter's line sixty chains sixty links west of the post planted during the present season to mark the southwest angle of the township of Dunnet, and the boundaries between number twenty-one and twenty-nine came out twenty-eight chains fifty-two links short of the six miles. This discrepancy between the theoretical and the actual distance between Salter's line and the one run by myself is abnormally great, even after making due allowance for the considerable length of the lines and the general rough nature of the country. The result is, of course, that some of the included timber berths will have less than their normal area. This circumstance is, however, of comparatively small consequence practically, as from all I could gather from information received from persons evidently well acquainted with the region, all the timber has been killed by the fire which swept through some years ago. There is thus no pine nor timber of any other kind of any commercial value on the berths specially affected by the error in question.

I shall now describe as concisely as I can, the tract of country that came under my observation during the survey. The geological formation is the Laurentian as is well known. The rock is gneiss principally ; on the south boundary of timber berths number twenty-seven, however, a few belts of syenite, or syenitic gneiss were observed. The gneiss is of the ordinary micaceous character, and in many places it is very distinctly foliated, presenting a regularly banded aspect. The rock west of the Wahnapitae River contains a larger proportion of feldspar than the rock further east. Towards the west side of timber berths number forty-three the strike is about north twenty degrees east, and has changed to north thirty-five degrees west, a few miles further east. Along the lines between numbers nineteen and twenty-seven, etc., the strike is more nearly east and west, being north of west, and south of east. Everywhere the strata appears to dip at a high angle. Along timber berths numbers sixty-seven, fifty-nine, fifty-one, forty-three, thirty-five and about a mile and three-quarters over upon number twenty-seven, most of the suface is rock, and is generally rough and broken and is quite unfit for settlement, containing as it does a very small percentage of arable land. The small areas of good land over the distance named, occur on timber belts number fifty-one and thirty-five, as shown in the field notes, and in small areas along the Wahnapitae River. East of this stream, all along number forty three, and for a mile over upon number thirty-five, the country is almost totally barren of soil, the surface being almost exclusively occupied by bare gneiss rock, or mossy swamps. In going east, as a point one mile and three quarters east of the southwest angle of number twenty-seven is reached a marked change may be noticed in the topographical features of the country ; the surface becomes level, or gently undulating, the rocks appearing to have been by glacial action, planed down to a more or less uniform surface. This character of country prevails, with a few exceptions, as far east almost as Wolseley River, and north to Salter's base line.

From the point above mentioned, one mile and three quarters east of southwest angle of number twenty-seven, as far east as almost to the end of the third mile on number nineteen, there is excellent land interspersed occasionally by small patches of rock cropping out. The soil is chiefly a brown clay loam of good quality. This tract of arable land extends south to the gorge of French River, but it is doubtful whether it extends very far to the north. To the east and to north of this tract of good land, as far as my survey extended, the land is rocky and unfit for settlement, the percentage of good land being very small.

The line going south from the southeast angle of timber berths number twenty-seven, to the south channel of French River, passes over nearly level or gently rolling land all the way, interrupted of course by the north channel of the stream last mentioned. The soil is a clay or sandy loam of good quality.

The timber plan indicates the distribution of the various kinds of timber. It is thus seen that the greater part of my line passed through a burnt country, the fire having gone over some parts a second time. The fire first appears to have occurred about fifteen years ago. Over this burnt country all the timber has been killed, and the burnt district extended as far as the eye could reach north of the line along the south of timber berths fifty-one, forty-three, etc., up to Salter's base line, and from information received from the Indians, I am led to believe that there is very little if any green timber, except perhaps towards the northwest, near Wahnapitae River and close to Salter's base line. Over some parts of this burnt district there has been very good pine, as is evidenced by the dead trees still standing ; the prevailing timber has been white birch, poplar, balsam and cedar ; there is now a young growth of small poplar, white birch, red cherry and willow coming up. In reference to the portions of my survey covered by green timber, I may say that the only place where pine of much value was seen, was between the Manzenazing River and the second mile post on the south boundary of timber berth number fifty-one. The trees, however, are rather under than over medium size, and much of the timber was valueless for lumber under present circumstances. Near the southeast corner of timber berth number eleven there is a small grove of very good pine, and farther west, between that and Wolseley River, there are some groves of white and red pine ; the trees, however, are of small diameter, although of thrifty growth. In the green woods along the south boundaries of numbers sixty-seven, and fifty-nine at various points, scattering pine occurs among the other timber ; there is some also at different points around Tyson Lake.

Besides the pine, the other kinds of timber seen were white birch, balsam, poplar, cedar, hemlock, maple, black birch, yellow birch, basswood, ironwood, black ash, etc. Between the south bomdary of timber berth twenty-seven and French River, and along the line running south from southeast angle of number twenty-seven, to the south channel of French River there is some very fine timber, hemlock, black and yellow birch, maple, basswood, etc. Around Tyson Lake there is much evergreen, hemlock, balsam and cedar. The Wahnapitae River is a fine stream with an average width of about one hundred and fifty feet ; it is broken by numerous rapids, but is still a fine river for floating rafts. The water is good and palatable, although of the dark color common to the streams of the country ; among the fish found in it are the black bass, pike, pickerel, etc. The Manzenazing River is a stream of sufficient capacity for floating sawlogs, although those that lumbered upon it some years ago, found it advisable to erect dams across it at several points between Collins' Inlet and Tyson Lake. Mullin and Pictou Rivers, as far as my observation extended, might each be described as a series of narrow lakes connected by a small stream broken by many rapids, and capable, perhaps, during a freshet, of floating small sized sawlogs. These streams flow in the direction of the strike of the strata, through grooves formed by the erosion of a stratum softer than those on either side of it. Wolseley River is a stream large enough to float timber at any season almost ; it has numerous expansions along its course. The water in all the streams crossed, except the mere brooks, was dark coloured, although sweet and wholesome. Tyson Lake and Manzenazing River contain pike and black bass.

Partridges abound in the woods, and some prairie chickens were shot in the brule north of French River. I saw numerous traces of bear, red deer and moose.

I have the honor to be, Sir,
Your obedient servant,
(Signed) JOHN MCAREE,
Provincial Land Surveyor.

THE NORTH WEST.

The Winnipeg *Times* says :—The industry of manufacturing lumber will no doubt be for a long time to come a large and increasing one in the Northwest, where towns and cities spring up and increase so rapidly, necessitating large supplies of lumber for building purposes. For some time past the quantity of lumber manufactured has been doubling every year, and next year the ratio of the increase will probably be still greater. A *Times* reporter yesterday called upon a prominent lumber man in this city, and obtained from him some information as to this industry.

"What are the principal lumbering firms in the Province."

"The principal dealers having offices in the city are the Rainy Lake Lumber Company, J. R. Sutherland & Co., Dick, Banning & Co., the Winnipeg Lumber Company, D. E. Sprague and Brown & Rutherford. Outside the city the principal dealers in the Province are the Keewatin Lumber Company, at Rat Portago, and Walkey & Burrows, of Selkirk."

"Where are the logs cut?"

"The logs are obtained from the shores of the Rainy Lake, Lake of the Woods and Lake Winnipeg, while some of the dealers import from the United States. The Rainy Lake Co. have 125 square miles of limits on the shores of that lake. Dick & Banning own 100 square miles on the Lake of the Woods. Walkley & Burrows, Brown & Rutherford and Stubbs Bros. each own 50 square miles on Lake Winnipeg. D. E. Sprague has a limit on the Rosseau River. J. R. Sutherland & Co. and the Winnipeg Lumber Company buy their logs from the States, the stuff being delivered in booms on the Red River."

In reply to a question from the reporter, the interviewer said the capacity of the principal mills is as follows :—Winnipeg Lumber Company, mill at Winnipeg, about 75,000 feet. J. R. Sutherland & Co., mill at St. Boniface, 100,000 feet. Rainy Lake Lumber Co., mill at Fort Francis, twenty million feet per season. Mill at Rat Portage, ten million per season. Dick, Banning & Co., mill at Rat Portage, 50,000. Walkley & Burrows, 25,000. Dr. Sprague, 25,000. Stubbs Bros., 20,000. With the exception of the Rainy Lake Co., these figures represent the capacity per ten hours. The total capacity per ten hours is about half a million feet.

"How many men are employed at those mills."

J. R. Sutherland & Co., employ about 100 ; the Rainy Lake Co. 300 ; Stubbs Bros., Brown & Rutherford and Walkley & Burrows, each 150 ; Dick & Banning 75 ; the Winnipeg Lumber Company 100 ; Dr. Sprague 50 ; or a total of a little under 800 men.

"Then there are the lumbermen?"

"Yes, I suppose that each of the above firms with the exception of those who import their raw material, would employ about double the number of men in the woods that they do in the mills."

"Heretofore," said the gentleman interviewed, in reply to a question from the reporter, "there has been a great deal of lumber imported, but now the lumbermen here are in such a position that they can supply the demand themselves, and they will soon be able to undersell the Minneapolis dealers."

"Is there any likelihood of lumber becoming any cheaper?"

"It will be cheaper for those who can buy wholesale or in large quantities, but it is probable that the retail prices will never be very much less. Those who have been buying in Minneapolis will now be able to buy here just as cheaply, and this being the case it will be to their advantarge to purchase here, the importation of lumber is becoming less every year."

"Could you give an idea of the quantity of lumber cut during the past few years?"

"Next year I believe there will be placed on the market about 125 million feet. The quantity last year was 40 millions, and this was about double the product of the previous year."

"Who are your principal customers?"

"Contractors and builders, in this city, in Portage la Prairie, Brandon and other places as far as the end of the line, and in the country west and south. Most of it is used for house-building purposes, and there is some manufactured into bridge timber and fencing.'

"Are there good facilities for floating the logs?"

"Yes, as good as can be found in the world."

"What pay do lumbermen receive?"

"About $35 a month on an average. Some first rate men can get more than this, and the pay of a foreman is, of course, considerably higher."

BUSINESS AT BOSTON.

The Boston correspondent of the *Northwestern Lumberman* writes as follows under date of Feb 1 :—Since my last letter the thermometer has been bobbing around anywhere between zero and 60 degrees above ; one day so cold and blustering that out-door work had to be given up, and the next day so warm that overcoats had to be unbuttoned to insure comfort. This variable sort of weather generally upsets business, and, on the whole, trade is rather quiet. I have not met a yard man as yet but that expresses the opinion that the spring trade will soon start up, and a great amount of lumber will be used. I think the trade is more and more coming to the conclusion that prices will not drop ; that is to any material extent. Some of the coarser grades may be shaded in price, as is alway the case where there is an over supply, but fine common and better will, in all probability, remain firm. Certain dealers are always afflicted with a chronic mania for running down prices. I can't conceive what the object can be for any person to use his best endeavors to break down prices, especially when they are not exorbitant. For the last year prices have not varied enough to prevent any yard man from selling "short," and getting out with a fair profit. At the same time, customers who have placed orders for future delivery, have had them filled acceptably. If prices had dropped how would it have been? All those orders would have been cancelled, and much trade lost in consequence. As a rule, I notice the parties who are always talking about prices dropping are either small buyers, with equally small ideas, or that class who are always finding fault with grades. The most reliable dealers we have in Boston are satisfied with present prices, and, when in want, buy like men, and do not go around the market beating down the price on a two-horse-load of lumber, and figuring if they need more of the same grade they can buy the balance of the same car cheaper. I believe the trade are becoming disgusted with

this class of trade; it certainly ought to, for it is a disgrace to any responsible concern to cater to it.

The railroads are pretty well filled up with a varied assortment of pine and hardwoods. The arrivals for several weeks past have been few. Many cars have been detained from three weeks to two months in transit by snow blockades. As to prices, on a strict market quotation, I can note no material change, although every day sales are made at what may be called very low prices, which can be attributed to several causes. First, some of the small dealers will have cars in that are paid for, and they are obliged to realize on them to meet other obligations, and I have known of cars being sold at an actual loss on this account. Again, the thickness may be unsaleable, and on that account the car may be sacrificed, but the most frequent cause is that the shipper (most low price sales being commission lots) has hurried sales to get his money, and the lumber has been sold at the best offer, which, in a dull season, is naturally small. I might add that very few cars sent on commission are A 1 in quality. Parties west sell their good lumber and ship the balance. This statement of course has exceptions, but they are extremely few.

WISCONSIN LUMBER CAMPS.

Mr. Edward Jack, Government lumber agent for the Province of New Brunswick, who has lately been examining some of the pine forests of Northern Wisconsin was interviewed lately respecting that country and its timber resources.

"Is the country remarkable for any particular kind of timber!" was asked.

"The pine there is as sound a quality of wood as I have ever seen, being remarkably free from defects of all kinds. In some places it grows so thickly that a million feet superficial of sawlogs have been cut from forty acres of land, and the country where it grows is not nearly so subject to forest fires as large parts of New Brunswick and Ontario."

"How are the lumber operations carried on in Wisconsin?"

"The hauling roads are graded in the autumn, the stumps being grubbed from the roadbed, which is levelled and skidded where there are holes; the main roads are cut wide enough to enable the teams to pass, as in many places they have two tracks, one for the loaded and one for the unloaded teams."

"Is not some trouble experienced from want of snow?"

"There is frequently not snow enough for hauling purposes, and then large sprinklers are used. The source of supply for the sprinklers is a large square tank, drawn by either two or four horses. With it the road is sprinkled where required. It is usually done in the night or every evening. Some seasons sprinklers are not used, but they are always on hand.

"Is the system of work pursued in camp the same as in Canadian lumber camps?"

"There is one chopper to two sawyers, and after the tree is chopped down the sawyers square the butt with a saw. The feller marks the length of each log and cuts off the top of the tree. The sawyers then saw it into the required lengths, the swampers, who are usually two to a team, trim the logs and swamp the roads. The logs are drawn to skid-ways, which are an inch or two higher at the front than the sleds. Where the ground suits logs are sometimes piled up eight or ten feet high. One of the swampers aids the teamster in rolling up the logs on the skid-ways. Where the rolling is heavy both swampers aid. There are two men whose business it is to load the teams, the teamster having nothing to say about it; one of these is called the "boss loader." The logs are scaled and marked on the skid-ways, so that the boss loader gets the contents of each log on its end, and the days work of each team is entered up in the log-book each night with the name of the teamster. The teams have names allotted to them in the autumn according to the teamster, and this name is preserved during the whole season, whether there be a change of teamster or not.

"The camp is usually built of logs," continued Mr. Jack, "and it is generally covered by pine splits. There are usually two windows, one at each end. In the camp there is a large box stove. The berths are arranged as in a ship, two or sometimes three deep; two men occupy each berth, and two men have three pair of blankets. This constitutes the sleeping camp. The cooking and eating camp is generally a couple of rods from the sleeping camp. In it is a large cooking stove and reservoir for water. One man cooks for as many as forty men, and he is assisted by a "cookee," whose business it is to keep on fires, attend to the sleeping camp, wash dishes, and cut wood, which is drawn up to the door for him. When water is convenient he carries it. Where the country is mountainous or hilly the men who attend to the roads sand the hills and keep them clear of snow. The teamsters' breakfast is usually over by 4 o'clock. About half the number of teams have their burdens loaded over night, and these proceed at once to the landing; the rest of the teams go to their respective skidderies with the leaders, who are provided with lanterns. They have one lantern at each end of the sled, on the side opposite the skidways; the logs are then loaded and drawn to the landing. The swampers, choppers, and others are called for breakfast soon after the teamesters have left, they are expected to be at the stump as soon as there is sufficient light to work. An alarm clock is placed in the camp by which all early operations are regulated. Socially and morally Ontario camps are for ahead of those in Wisconsin. Many residents of Ontario are now in Wisconsin, especially among the iron prospecters of the Penokee range, where extensive deposits of ore occur."

"It the fare served to the men in camp of good quality?"

"The men's food consists usually of pork, beans, beef, tea, coffee, sugar, syrup, bread, and when obtainable, potatoes are used. Frequently they use boiled rice, pies and puddings. Food is abundant and good, although the quality of the pork is not so good as that used in the woods in Canada, a great deal being distillery-fed. Horse feed is composed of hay, oats, and bran. Ground feed for horses is also frequently used; this is a mixture of corn, oats, and mill sweepings, whigh is not at all to be recommended, frequently subjecting the horses to colics."

"Logging tramways" are frequently made use of in Wisconsin instead of rails. Poles from four to ten inches in diameter are made use of. The road is roughly levelled, and these poles are placed six feet apart, and are connected by cross ties laid under them at distances of from four to ten feet. The rail is fastened to the cross ties by means of wooden pins driven through both. The trucks made use of to run on these rails have four wheels to a car. These wheels are loose on the axle, and there is three inches play between the shoulder, to enable the cars to pass around sharp curves. The rim of the wheel is hollowed out, having a flange on both sides. These cars will hold 2,500 feet of scaled logs; this load can be drawn by one horse. These tramways are used in many places in Wiseonsin. The weight of these cars, wheels and all, need not exceed 500 lbs. The average cost of constructing such roads, with rails and ties complete, is about $100 per mile."

WOODS AND FORESTS.

We take following from the annual report of the Commissioner of Crown Lands for Ontario: The sawn lumber and square and waney timber business has been active and remunerative during the past season. In my report for 1881, I mentioned the fact that the former article had realized greater value than for years past, and that prices obtained for square and waney pine, of good quality and fair average, were higher, than during any former period. It is satisfactory to be able to state that during the season just closed there has been no falling off in prices, and that the demand for all kinds of wood goods continues brisk.

The year 1882 has offered no special points for comment in connection with the administration of the Woods and Forests branch of the Department.

It may not be out of place here to mention that a meeting of the American Forestry Congress was held at Montreal in August last, at which the Government of Ontario was represented by gentlemen qualified to note proceedings and deal with points brought forward by the several speakers with regard to Agriculture generally, Practical Husbandry, Fruit Growing, Tree Planting, etc., and the officer in charge of the Woods and Forests branch was detailed to give special attention to matter relating to timber, and to means which might be suggested or proposed for the preservation of forest from fire. This subject in the original programme, was committed to a special section of the Congress to deal with, but on account of its great importance it was decided that it should be discussed at a meeting of the whole Congress. At this sitting various opinions were advanced as to the best means of preventing forest fires, and a committee of gentlemen from the United States and Canada, connected with the lumber business, was appointed to make such recommendations on the subject to their respective Governments, as might be deemed expedient. No intimation as to the measures the committee had resolved to recommend has yet reached the Ontario Government, but when made known they will receive the most careful consideration.

THE READY-MADE HOUSE INDUSTRY.

The *Northwestern Lumberman* says:—The Canadians are making such a considerable and profitable business of ready-made house manufacture that it seems strange that Americans, who have the reputation for seizing new opportunities for money getting do not branch out in this direction more extensively. True it is that the rapid settlement of the Canadian Northwest has stimulated the inventive genius over the line to devise some way to provide the shelterless new-goers on to the prairie wastes of the country with houses, and the knock-down plan of preparation and shipment has proved to be the most feasible and quickest way to meet the exigency.

Illustrative of the manner this industry is progressing, it is mentioned in the London, Ont., *Advertiser* that the Truaxes' planing mills at Walkerton, are turning out material for ready-made houses at a rapid rate. Orders for a whole row of houses can be filled in a few days, and it is not uncommon to see an entire street for Brandon or a block for Winnipeg sent out on a train 20 or 30 days after the order has been received. During the past season Messrs. Truax shipped 219 cars of knock-down house material to the Northwest. One of the partners in the concern accompanies each train, and superintends the putting up of the houses. Sometimes houses are ordered by telegraph in this fashion: "What can you furnish me a tidy cottage for, 22x40 feet, with bay window and veranda?" Next spring the enthusisastic house-builders expect to receive orders for entire villages, something after this style: "What is your lowest figure for five stores, two wagon and two blacksmith shops, one Methodist and one Presbyterian church, 25 cottages, a town hall and a lock-up, to be delivered on or before July 1?" Orders have been received for 21 houses to be put up in Brandon next spriug. The freight rate on these houses from Walkerton to Chicago is $40 a car; from Chicago to Minneapolis, $20 a car. The charge the balance of the way is enormous, owing to the lack of competition, the cost of a medium car through from the start to Winnipeg being $361. The large ones used by the Truaxes cost more. Considering the fact that Chicago is nearer Wiunipeg thau Walkerton, Ont., why cannot the knock-down house business be made profitable here, and still more so at Minneapolis, Duluth, or any other lumber point in the Northwest?

THE U. S. TARIFF.

The following petition has been presented to the two houses of the U. S. Congress:

To the Honorable the Senate and House of Representatives of the United States:

Your memorialists, citizens of..... County, in the State of.....do most respectfully remonstrate against the propositiou now before your honorable bodies, and adopted in the Senate of the United States, looking to the admission of manufactured lumber of the Dominion of Canada to the markets of the United States free from duty, to ruinously compete with a traffic giving employment to fully one million laborers and involving capital of not less than $300,000,000 in its prosecution. Urging, that the admission of Canadian lumber free from duty would but be adding the present rate of duty to the value of Canadian standing timber, opening up a competition injurious to American manufacturers, while not decreasing the cost of building material to the millions who form the consuming classes; urging, further, that so long as the Canadian Government retains the tax upon lumber imported into Canada, it is manifestly unjust to admit Canadian lumber free, while the American product, now largely in demand in Winnipeg and some other portions of the Dominion of Canada, is burdened with a tax, thus effectually giving to the Canadian product the control of the markets of this country by the admission of their lumber product free in the Eastern States, whither it is most largely imported; and as well control of the Western markets through their ability to exclude the American product, except upon payment of duties, from Winnipeg, to which their own lumber may be sent without duty.

Hemlock Lumber.

The *Northwestern Lumberman* says:—An unusual large amount of hemlock logs will be banked in Pennsylvania this winter. Hemlock lumber seems to be growing in favor, even in the older sections of the country, where it has been used for years. Never before has so much attention been paid to hemlock in Michigan as there is this season, both manufacturers and capitalists having learned that it is not the kind of timber to be sneezed at. Nothing can prevent this interest keeping right along increasing. Merit will in due time command attention, and hemlock is now receiving some of the attention that would have been proper to have bestowed upon it several years ago.

Letter from Member of Congress.

HOUSE OF REPRESENTASIVES,
Washington, D.C., Feb. 19, '82.

GENTLEMEN,—Inclosed find $1, and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a bad cold, as has almost every one else here, but cannot find the Elixir, which I used frequently at home and consider a most valuable medicine; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GROUT.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterhorough, Ont. w46d112l22

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery, decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterhorough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto, Ont.

CHICAGO LUMBERMEN ON THE TARIFF QUESTION.

The *Northwestern Lumberman* says :—The vote of the national senate to place rough lumber on the free list of imports has awakened much interest among the lumbermen of this city, as might be supposed. The manufacturers ars whistling a note of indifference, though it is plain that they are a little worried about its effect on their interests, while the jobbers are in the seventh sphere of elation. Thad Dean is going on a regular "bender" of jubilation, and thrusts his thumb into the vest of every manufacturer he meets, and laughs the laugh of triumph into their faces. He says the crushed jobber has done with gnawing bones, and will hercafter live on the fat of the land. He even offers to lend money to such houses as Kirby, Carpenter & Co., to help them weather the storm that he predicts will surely overtake them during the next market season.

In view of the fact that the tariff bill has not yet passed, and that a multitude of conflicting interests will have to be adjusted before it can, and that as the bill now stands it is an entirely different chicken from what it will be when the committee have done plucking at it, the jubilation of the jobbers on one hand, and the fear of manufacturers on the other, are a little premature.

Yet it is interesting to lumbermen throughout the country to know how the possibility that lumber will be placed on the frec list is regarded by some of the representative men in the trade here, and the following expressions of opinions have been obtained.

Mr. A. A. Carpenter, of Kirby, Carpenter & Co., the Menominee manufacturers, appeared to the interviewer to be quite indifferent to the lumber schedule, or its fate in the tariff bill. He said that he was in favor of a modification of the tariff, but wanted an equitable and well-considered, moderate reduction. As to the lumber duties, he thought that their removal would have no such remarkable effect on the market and trade at this point as Mr. Dean and the other jobbers were confident of. The effect, if any, would be felt in diverting some of the Saginaw output to this market, for the reason that Canada lumber might become a more powerful competitor in Eastern markets. The removal of the duty on lumber might tend to stimulate production over the border, and the volume of increase would crowd Saginaw lumber to some extent in such markets as Albany, Burlington and Oswego, and possibly in Buffalo and Tonawanda and all other Eastern points. The tendency, too, would be to enable Canadian manufacturers to discharge their surplus into different American markets whenever such occasion should arrive—it would give them a wider and more diversified field of operations. He did not seen to have arrived at a positive conclusion as to the effect of free-of-duty lumber on this market in the coming season. Mr. Carpenter, being a careful man, probably dislikes to express a positive opinion in regard to the matter in its present undeveloped state. He thought that there was was a probability that the duty on lumber would not be wholly removed, but that a splitting of the difference might be resolved on, so that when the tariff bill finally passes both houses of congress, the duty will be placed at about half what it is now. But if lumber was finally and absolutely placed on the free list, its chief effect would be to increase the price of standing pine in Canada. The difference between the cost of standing pine in Canada and the price of stumpage on this side of the line is about what the duty amounts to. Carpenter thinks that as soon as lumber is admitted into the United States duty free, both the government of the Dominion and the limit holders will put up the price of stumpage to somewhat correspond with the value of standing pine on this side. That would, of course, make the first item of cost of Canada lumber about the same as the American product, so that the only advantage the Canadian manufacturer would have over our own would be in the cheaper rate at which he can possibly procure labor and supplies, conditions that may change in the near future.

Mr. G. A. Van Schaick was found ready to speak right out on the lumber tariff question, as he generally is on any other. He always has an opinion, and is not afraid to express it or bet on it. It is not invidious to say that Mr. Van Schaick's argument generally goes with his interests. He is engaged in business for all there is in it, and he don't propose to give it away by any damaging admissions. For this reason the following opinion of Mr Dean's most ready and valiant antagonist is all on one side. He scouts the idea that Canadian lumber can make any ripple in the Chicago market. He goes directly to this conclusion by assuming that the Canadian mills are not prepared to turn out any appreciable increase of lumber, nor will they be for a year or two to come. They are set to cut deals for the English, Eastern and South American markets largely, and until their gangs are changed their output will mostly tend in the direction usual to them hitherto. Besides, all the Canadian line of trade is always from western markets, the Canadian product has been thus absorbed, and it does not appear probable that any considerable quantity of it will have to seek Lake Michigan markets. The opening of the Canadian Pacific railroad line will divert a large amount of lumber westward to supply the vast prairie region of Manitoba and the Northwest Territory, which will likely absorb the surplus of the Muskoka and Spanish river districts, while the eastern and ocean trade will take care of the Ottawa river product. Speaking of the Ottawa, Mr. Van Schaick said that he had the authority of H. W. Sage's statement that the pine on the stream was all gone for 200 miles on its lower portion, and that the cost of driving on the upper waters of the stream was so great, in consequence of rapids, that lumber manufactured from logs brought down from the region away up toward Lakes Nipissing and Temiscaminguc would not compete ruinously to American profits, even if the duty were removed. He thought also that there was some doubt about the amount of available and handy pine in Canada, especially in the Georgian Bay districts, which, if any, would come in competition with Michigan lumber in this market. As Mr. Van Schaick looked at the situation, it would require two or three years of readjustment to bring to bear the full force of Canadian competition in the Chicago market. In the meantime the Saginaw valley supply will have been reduced by 2,500,000,000, the Menominee reserve to a large extent, and then if Canada wanted to shoulder around in the Chicago market she would be welcome to do it. As for him, he should not lose a wink of sleep about the lumber tariff on or off. And as the cheerful and alert lumberman leaned back in his chair, and beamed on the representative of the *Lumberman* with complacent smile between the toes of his boots on the table, nobody could doubt his word. Mr. Van Schaick also held firmly to the view that the effect of rescinding the lumber duty would be to bull Canada standing pine to about the amount per thousand now charged on importations, which was concided in by Mr. Addison Ballard, who was present and listened to the conversation.

Thad Dean, the conspicuous among the bearish jobbers of Chicago, was decoyed into Mr. Carpenter's office, and asked to express himself on the tariff question. He was so occupied with glorifying his triumph in the national senate, and prodding Mr. Carpenter about it, that he had but little else to offer. His main hold, however, was the probability that Canadian cheaper lumber would so crowd the Saginaw "fellers," as he termed them, that they would be forced to seek a market westward, and thus the jobber would have a better chance, amid the competition and rivalry that would ensue, to buy and sell at a greater profit than has characterized the trade here for a year past.

YOUNG'S POINT.

From Our Own Correspondent.

A TRIP TO THE SHANTIES.—On Tuesday, the 23rd January, at the invitation of Mr. George Chalmers, your correspondent went on a three days trip to his three shanties, to see how the foreman and men were getting along in the woods with the great depth of snow that has fallen this winter, which is almost 3 feet deep on the level. We left on the above date for P. Cassidy's shanty No 1, about 5 miles from the shore of the head of Stony Lake, 30 miles from the Point. After crossing the lake from C. Crow's Landing, in Dummer, we arrived at the shanty and had dinner. We found an old Peterborough boy, who is fond of living away from civilization, acting as cook. This old boy, who is nearly 40 years old now, was at one time a watchmaker with Messrs. Brown & Clark, of Peterborough; he looks hale and hearty, and evidently takes his billet after dinner. We started for Cassidy's shanty No. 2, in the Township of Methuen. This shanty was built a year ago, but Mr. Cassidy has made considerable inprovement on it this winter, having made the roof higher and and more comfortable for the men. At the rear he has got a nice little office built, which is occupied by Mr. Flaherty, the clerk, the blacksmith and the foreman. All the ready made clothing, etc., is kept in this place for safety. Mr. Cassidy took us to where the logs are getting dumped on the banks of Jack's Creek; it is a fine sight to see so many saw logs all heaped together on the ice. They are a fine lot of logs. Up to the time we were there, he had about 25,000 logs cut with about 17,000 drawn on the creek. The rest were skidded in the woods. He got 9 saw logs out of one tree last Monday; the top log was 13 inches in diameter at the small end, and altogether they were 117 feet in length. He has 65 men, 12 teams and 2 yoke of oxen in the two shanties. The men are very well behaved, and Cassidy is very much liked by them. He knows the lumbering operations thoroughly, and has been foreman for several large lumbering firms. On Thursday morning after breakfast we left for Apsley, a distance of 20 miles. It was a beautiful morning, but very cold, and splendid sleighing. We passed through some fine woods, thick with pine, belonging to Messrs. Fowlds, of Hastings; Rathbun & Sons, of Deseronto mills, and Ullyott & Sadler. They are all lumbering heavily this winter. We passed three or four shanties in full blast. We reached Apsley at 11, a. m., and after feeding the inner man and horses at A. McIlmoyle's hotel we started for Dugan's camp, in Anstruther, at 1 p. m., distance 17 miles. The miles in this part of the county are all Irish miles, they are so long and full of bends—making straight roads is out of the question. We passed through some beautiful pine limits belonging to Messrs. Ullyott & Sadler; they have four or five shanties in full blast in this section. We reached Dugan's camp about 3 p. m. It appeared a long road through the woods, marshes and small lakes. Arthur was busy at work along with his men in the woods. He has got about 4,000 of the largest pine logs I ever saw cut. He has also got out a large quantity of board timber 20 to 35 feet long, which will on an average measure 80 feet. Arthur has 30 men all told, five teams and two yoke of oxen. Albert Cook is the clerk, and Tom Cassidy cook,—and a first-class shanty cook he is. He is supplied with lots of beef, pork, potatoes, sugar, syrup, and dried-apples, all of the best quality, and his motto is not to waste, but to turn out everythiug properly cooked to the men in the employ and also for the benefit of his employers. A bad, greasy, wasteful cook is an expensive item in the lumbering business. Dugan's logs and timber goes through Eels Lake, thence by Eels Creek into Stony Lake. It is to be hoped there will be lots of water this spring and summer in the creek so as to allow all the lumbermen's logs to float down. For some seasons past it has been hard work to get these down. All the dams and slides are to be put in good order before spring. We left the camp on Friday morning after breakfast—it was 33° below zero—and got to Apsley at noon. We started for the Point after dinner, very much pleased with our trip; the roads were good, but the weather extremely cold. The total distance travelled to the furthest shanty and back was 134 Irish miles.

PROTECT OUR FORESTS.

In view of the enormous consumption of timber in the United States, and the certain exhaustion of the supply; it would be well for the legislatures of the several states now in session, to pass laws regulating the cutting down of the forests, at least on public lands, and could they be made, so as to prevent the wholesale and reckless destruction of timber on private property it would be of inestimable value to our rising generations. There are portions of the country where valuable forests of pine woods still exist, but being remote from easy transportation they are being felled for fire wood, rails, and other domestic uses, when by having in each county an inspector of forests these mines of wealth could be saved from destruction. Some few of our far sighted land owners appreciate the coming scarcity of these high price woods, and are jealously keeping them, but as a rule, the ordinary farmer in search of a load of fire wood, would as leave cut down a walnut or poplar tree as one of a worthless variety for any other purpose than burning.

It should also be required by law of each land owner, in those localities where timber is scarce, to plant every year a given number of trees. By this simple legislation, if enforced, the loss, of our forests could be mitigated to a considerable extent, and beautifying the country as well.

Walnut, black locust, oak, poplar, and cotton wood are all excellent varieties which experience has taught can be cultivated successfully. They are of comparatively slow growth, though the walnut and black locust will reach a maketable size in less than twenty years, while the others mature much more rapidly.

If every farmer in the country would plant around his farm, and as subdivisions for his fields, rows of the above trees, besides doing futurity a service, he would add much to the value and appearance of his property. The amount of land lost to cultivation by this slow growing crop, and its shade, would be insignificant in a country where land is as cheap as it is in ours. Were the legislators to pass a forest protectiug law, and the farmers throughout the state aid its inforcement, and plant trees as suggested, the natural increase in our timber wealth would be far larger than any one would at first imagine.

In Spain it has been the custom from time immemorial for every person eating fruit to plant the seeds; as a consequence every highway and byway in that beautiful country teems with magnificient orange, lemon, pomegranate, peach and apple trees, bearing with each year vast amounts of luscious fruit, which is free to anyone who cares to pluck and feast upon it. This national orchard is the property of every Spaniard; because each one had aided to plant it during the past centuries. So would systematic tree planting become a national affair in America, and one which every citizen of the nation would have cause to be proud of.—*Lumberman's Gazette.*

MISAPPROPRIATION OF SAW LOGS.

The Ottawa *Free Press* of Jan. 31st has the following report :—Almost ever since the vast lumbering resources of the Upper Ottawa were first developed in years gone by, a class of individuals known as log thieves, have plied their nefarious calling along the banks of the river. Of late the illegal practice has not been carried on to so great an extent as in past years, when these purloiners made so bold as to even erect small mills in which to manufacture their ill-gotten timber. Logs to the value of thousands of dollars have been taken in this manner and sawn into boards and other timber. The high water in the spring and fall annually floats large numbers of logs on shore where they remain, and it is these that are more generally stolen. The mill and limit owners, by united efforts, have happily succeeded in exterminating this class, who have probably now turned to more honorable employment. The interpretation of the statutes in regard to stray logs has frequently given much trouble, and many cases brought by the limit owners against parties on a charge of cutting up and using stray logs for firewood, etc., have been decided adversely to the prosecution. A case has just cropped up which will be watched with interest by lumbermen. William Rowan, who lives about the Chats, in the township of Fitzroy, appeared before James Clark, J. P., in the Police Court, to answer the charge of unlawfully taking, holding and keeping in his possession a number of saw logs belonging to different lumbermen. Indictments were taken out against him by J. R. Booth, W. G. Perley, E. H. Bronson, E. B. Eddy, Sherman, Hurdman & Lord, Allen Gilmour, J. D. Gilmour and

Peter McNaughton. A. J. Christie was counsel for the prosecution and James Dowdall, of Almonte, counsel for the defendant. Jessie Smith, in the employ of the Upper Ottawa Improvement Company, laid the information against Rowan who pleaded "not guilty." Three witnesses besides Mr. Smith were examined. They were Mr. Green, manager of the U. O. I. Co., Mr. Ritchie and Mr. Hurdman. The evidence adduced clearly showed that the defendant admitted to Messrs. Smith and Ritchie that he owned the piles of wood on the shore of the Ottawa river from which were taken pieces of logs bearing the stamp of the different lumbermen who took out the indictments. The counsel for the defendant contended that his client, having a contract to supply cordwood to a Mr. Murphy, boat owner, and it was in a pile of this wood that the pieces of logs were found, he was not the responsible party. He also contended that the case should not be tried in Charleton County, as he held the wood was not piled in the township of Fitzroy, but a short distance outside.

The case was postponed.

THE SENATE AND THE TARIFF.

The action of the Senate in adopting an amendment to the tariff bill offered by Mr. Ingalls, by a vote of 25 to 23, which places lumber on the free list, naturally causes a stir among the lumber-producers of the northwest, and particularly in Michigan, where the manufacturers will, under this measure, be brought into ruinous competition with the vast Canadian forests and cheap labor. The lumber-producers of Michigan should thoroughly understand the nature of this amendment to the tariff. The Ingall's amendment, which was adopted by the Senate, repeals the existing duty on timber, squared or sided, sawed boards, plank deals and other lumber of hemlock, whitewood, sycamore and basswood, and all other articles of sawed lumber, staves of wood of all kinds, pickets, palings, lath, shingles and pine and spruce clap boards. This amendment, if accepted by the house, and becomes a law will take more than one million dollars out of the pockets of the producers of lumber on the Saginaw river alone, the present year, and more than $4,000,000 out of the pockets of Michigan producers of lumber; and it requires no great stretch of imagination to understand that a matter of three or four million dollars annually out of the pockets of the producers, will cause a corresponding reduction of the income of the vast army of workmen employed in the manufacture of the lumber. It is a very serious matter.

The close vote on the amendment in the Senate gives rise to the belief that the bill will never pass the house, and it is important that the friends and advocates of American industry in congress receive a hearty support in their effort to defeat a measure that is calculated to rob American labor of its just dues.

The board of trade, etc., and manufacturers of lumber and other forest products generally in the state, should take active steps at once to forward delegations to Washington to strengthen our members in the struggle for protection to American industries.—*Lumberman's Gazette.*

THE ADIRONDACK FOREST BILL.

The Adirondack forest bill, which has been pending in the New York legislature, and has possibly become a law by this time reads as follows:—

"Hereafter, and from the passage of this act, no sales shall be made of lands belonging to the state, situated in the counties of Clinton, Essex, Franklin, Fulton, Hamilton, Herkimer, Lewis, Saratoga, St. Lawrence and Warren. Nothing in this act shall be construed as prohibiting the commissioners of the land office from conveying land heretofore contracted to be sold and not yet conveyed to purchasers thereof."

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* says:—At the late meeting of the Society of Sawmill Owners and Timber Exporters it was reported that the reserve of logs usually lying in the waterways up the country over winter was nearly entirely wanting this year, the logs having already arrived at the mills. This is a circumstance to be taken notice of by importers, as any failure in the floating or delay in the arrival of the logs at the mills in 1883, would soon cause a scarcity of stock and sharp upward movement in prices. To judge from the quantity of snow that has fallen, a want of water in the river seems improbable; but, on the other hand, it will be unwise to reckon on such a floating season as the last, and consequently the inferences are that stocks will be proportionately less in autumn than at first open water.

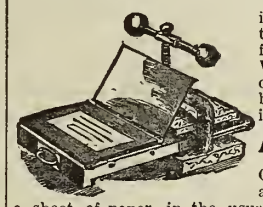
THE Montreal *Gazette* says:—A fair local enquiry exists for both hard and soft woods and former values are generally well sustained. There is also an American demand for pine for spring shipment and hard woods for immediate delivery. Dealers report the outlook for the coming year's business as very encouraging. The weather has been all that could be wished for lumbering operations in the woods and a heavy cut of logs is already reported.

AN East Saginaw despatch says a large meeting of the lumbermen was held at the Board of Trade rooms there, and a committee of twenty-five was appointed to go to Washington to bring influence to bear against the proposition to put lumber on the free list. Telegrams were sent to Chicago, Minneapolis, Muskegon, Manistee, and Lake Huron shore points urging similar delegations of lumbermen to meet the Saginaw delegation in Washington to effect unity of action.

WALTER LINTON, of Waterloo, writes that Hagyard's Yellow Oil has done great good in his family, his wife being cured of Callouse lumps that other medicines failed to remove, he he also states that a neighbor was promptly relieved of Rheumatism by the same remedy.

FORTUNATELY Valvular disease of the heart is not very common, its disturbed action may be due to indigestion, liver irregularities &c. A Stomach disturbed with wind, or indigestable food will cause pain and fluttering by crowding on the nerves of the heart. Burdock Blood Bitters will speedily remedy all such difficulties.

ZUCCATO'S PAPYROGRAPH



is a new invention for the rapid production of fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.

Autograph Letters

Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet

500 COPIES PER HOUR

may be printed upon any kind of dry paper, or other material, in a common Copying Press.

This is the Most Simple, Rapid and Economical Process yet Discovered.

THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.

The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.

For specimens of work, price-list, etc., address with stamp.

CONSUMPTION

POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, a **Free Trial Box.**

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,
20L24 **360 Fulton Street, Brooklyn, N. Y.**

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. FEB. 15, 1883.

A large amount of Wisconsin pine land is changing hands. Speculators are disposing of it, and operators are securing the same for practical operations.

REPORTS from the Wisconsin pineries are to the effect that the anticipated cut of logs will be secured unless a general break-up should occur, and the same may be said to be true of Michigan.

THE Prince Arthur's Landing *Herald* says: Messrs Manning, McDonald, McLaren & Co., have a force of 1,200 men at work this winter getting out timber and ties for the Syndicate, to be used on the prairie section.

BY a provision of the new constitution of the state of Louisiana, wood-working factories, saw and planing mills, and many other varieties of manufacturing establishments, are exempted from taxation for a period of ten years, provided that not less than five hands be employed in any one factory.

MR. WM. LITTLE, of New York, has published a pamphlet on the United States "Tariff on Lumber, and the Tariff Commissions," being a review of the evidence of the Saginaw Board of Trade. He claims that the state of trade in Michigan and in Canada is very inaccurately and unfairly compared.

THE *Timber Trades Journal* says:—The timber trees blown down by the very destructive gale in October last on the estates of the Marquess of Sligo at Westport, County Mayo, have been purchased by Mr. Robert Hewson, of St. Asaph, North Wales. The fall is an immense one and will take twelve months to remove.

THE loss sustained by the Canada Lumber Company by the recent fire at their premises, at L'Assomption, is about $25,000. Of this amount $20,000 is covered by insurance in the Commercial Union and Fire Insurance Association of London, England. The former company has paid the amount of its risk, but suit has been entered against the Fire Association, which is still pending.

THE Newmarket *Era* says:—For the first time since commencing operations in Newmarket, the Messrs. Cane have got all the logs teamed in that they had cut. Another gang of men are at work now, however, chopping more trees down, and the firm intends to team them in as long as the snow lasts.—Great skidways of logs now cover the flats and there will be lots of work at the mill this spring.

THE *Northwestern Lumberman* says:—Louis Sands, of Manistee, Mich., has purchased the Cypress Hill limit, 600 miles west of Winnipeg, Man., embrasing 150,000,000 feet of pine, at a consideration of $200,000. He will build a small portable mill thereon, beginning the work about April 1. The Canada Pacific will pass within 12 miles of the limit. It is safe to say there is money in the purchase.

FRENCH cabinetmakers are constantly on the elert to secure the beams and timbers from buildings in course of demolition. In pulling down a house in Paris recently, in addition to the large sum realized from this source, a hoard of 300,000 francs was discovered in the walls, while works of art were hidden behind the wainscot. All the woodwork of the house was bought by cabinetmakers and decorators.

THE Georgian Bay Lumber Company are having a fine new tug boat built at Port Severn to do their work on the river above the mill. The vessel will be 65 feet long by 14 feet wide. Mr. James Storey, of Collingwood, is contractor. The company are also erecting a fine large boarding house, two storeys high, 30x70 feet, with wing 24x24. It is expected it will be completed by the time the mill starts, in the spring.

MR. T. H. SHEPARD, who has charge of the lumber camps of the Rainy Lake Lumber Company, arrived in Winnipeg, lately. He states that by the spring over 20,000,000 feet of logs will be cut in the woods there. Two hundred and forty men engaged in the woods and the company has thirty-five teams in the bush. The saw mill at Rainy Lake is being enlarged, so that an extra number of men will be engaged next summer.

THE Wilson Hoop Company's factory, at West Bay City, Mich., is now turning out 120,000 barrel hoops and 25,000 short hoops per week, and the company expects to have on hand next spring 3,000,000 hoops. Elm timber is used, largely hauled in by farmers in the surrounding country. This timber growing profusely along the river, was once considered nearly worthless, but hoop-making has furnished a use for it. A considerably quantity of elm also comes in by rail.

A correspondent of the Buffalo *Lumber World* writing from Johnsonville, S. C., incidentally mentions a curious instance of the influence of animals in controlling or preventing forest growths. It appears that the fondness of hogs for the juicy roots of young pines leads them to seek them assiduously, so that where hogs are allowed to roam in that region one can hardly find a young long-leafed pine in a thousand acres of pine forest. There being no young trees to take the place of the old ones used up by the lumbermen and turpentine gatherers, that species of pine timber is rapidly being exterminated.

THE Minneapolis *Lumberman* has this to say of a gentleman who formerly operated chiefly in this city: W. C. Yawkey, of Detroit, Mich., a lumberman who is worth over half a million, has been attending the St. Cloud land sale, and has invested quite liberally in pine lands. He also, in partnership with Judge Evans, purchased lands on the Wisconsin, on which there is about 95,000,000 feet of standing pine, and none of which requires over a three-mile haul. It is believed that the gentleman cleared $100,000 in the operation. Mr. Yawkey has sold a vast amount of his Michigan lands during the past year, and the *Lumberman* would not be surprised if both he and Judge Evans decided in the not distant future to locate in Minneapolis.

THE Ottawa *Free Press* of February 9th says:—We are informed that the British and Canadian Lumbering Co., headquarters in Toronto, have purchased the extensive saw mill near this city, known as Skead's mill. The sum is said to be in the neighborhood of $100,000. The transfer is likely to be of great benefit to this city, as the company purchasing is a powerful concern and will, we are assured, run the mill to its full capacity. Shipment of lumber will likely be made by railroad.

THE Prince Arthur's Landing *Herald* says: We understand that L. Belanger has the contract for taking out the timber and erecting Marks' new mill, the dimensions of which will be 100x40 feet. The steam hammer is busily engaged putting down the piles for the foundation. It would not be at all surprising to us, judging from the way things are shaping at present, if a transfer of the Canadian Pacific Railway between here and Rat Portage would be made from the Government to the Syndicate at an early date.

A SHORT-SIGHTED POLICY.

To the Editor of the Canada Lumberman.

DEAR SIR,—Your valuable paper is doing a good work by encouraging all thinkers and lovers of our country to look into our future welfare regarding our demand and supply for lumber, and by many able remarks about tariffs, and the protection of forests, all of which should be our first duty to think of—who have the faculty to think at all. I may be pardoned for mentioning one or two facts which, perhaps, have not come under the notice of the public, and it is time they did. Lately our streams and the river St. John are threatened to have a regular slaughter carried on in our short lumber trade, shingles, and clapboards, by Americans. They have built and are building mills to manufacture our cedar and clapboard stuff, which if allowed to be carried on they will, before six years, cut and carry away all our stock of short lumber, and manufacture it on the American side to save the duty, and build up American mill owners and capitalists, instead of our own, and damage our future short lumber prospect, which is now our only dependence in the lumber line to help us build up our country with mills and manufactories. I find no fault with the tariff, but I blame the Goverment for not enforcing it. We have laid down in the tariff one dollar per cord on shingle bales and one dollar per M. on spruce and pine logs, export duty, but our Finance Minister will not enforce it. So here we are giving a premium of one dollar per M. on logs, and one dollar per cord on shingles right to Brother Jonathan to come over the lines and slaughter our lumber to help build up his country, and damage our own. On one stream there will be three million cedar got out to stock one mill on the American side, besides the clapboard lumber, and I may venture to say that much more is being got out in other parts for the same purpose, to save American duty. No doubt over fifty million shingles will be manufactured out of the Province limits this year, besides the host that was cut before and went scot free, we may put at three million feet of cedar cut on one stream at the least, nine million cords, and at one dollar per cord we are losing nine thousand dollars of a revenue robbed from our streams besides the clapboard lumber. The above will show to any man of sense the necessity of entering a complaint and having the slaughter of our forests looked into by the proper parties paid for doing their duty.

Respectfully yours,
A PROTECTIONIST.

Little Falls, Madawaska.

THE ADIRONDACK WILDERNESS.

The need of saving the woodlands of the Adirondack wilderness, out of which flow the Hudson River and other streams of great commercial, manufacturing and sanitary value to the State, has long been recognized by observing and thoughtful citizens. The outer and more accessible portions of the original forest region have long been stripped of their timber, and vast areas of little use for agriculture have thus been made treeless and barren. So long as the forests of Maine and Michigan and other wooded regions in the North and West were able to supply timber at a less cost for transportation to market, the remaining Adirondack forests were practically protected from the inroads of lumber men. That protection they are rapidly losing, and quite recently vast tracts of heavily wooded lands in that region have passed into the hands of timber cutters.

There is no question that the general clearing of the Adirondack region of its protecting forests would produce effects of the most disastrous character to the valleys of the streams flowing therefrom, effects like those which, during the past few months, have brought death and desolation to so many European river valleys. The rainfall of the Adirondack region is great, the drainage slopes steep, and without the controlling and restraining influence of the existing swamps and forests about their sources, the rivers which drains this northern wilderness would show only great and sudden alterations flooded and empty channels, destructive at once to the agriculture of their valleys, to the manufacturing interests which cluster along their banks, and to the commerce of the Hudson, the channel of which has already been seriously obstructed by the detritus washed in from unprotected hill slopes and other spaces stripped of their original forests.

It is gratifying to note that the State Legislature, or rather the Senate, has taken ground against the further invasion of the Adirondack forests, at least for that part of the region under State control; and it is much to be hoped that the Assembly will do as well. Senator Frederick Lansing's bill, forbidding the sale of 660,000 acres owned by the State in the Adirondack region, was passed by a vote of 24 to 5, January 23. It is a good indication of increasing public appreciation of the need of preserving the wooded character of that part of the State. The timber there, if cut at all, should be cut only under rigid control, and with the most careful provisions for immediate rewooding of the cleared ground.

STEALING A MARCH ON THE DRIVE.

Since December 14, 1882, the C. N. Nelson Lumber Company, of Stillwater, Minn., has been doing an extensive log-shipping business over the St. Paul & Duluth railway, from Mission Creek station to Stillwater and Lakeland, for the purpose of getting logs to start its mills with in the spring before the drives come down. It is a novel move in the logging industry of the upper country, and it is thought that, if the plan works satisfactory, lumbermen in the St. Croix valley will not depend so much on the streams for log conveyance hereafter. Really, there is no reason why logs cannot be run to mill by rail in Minnesota and Wisconsin as well as in Michigan, where vast numbers of logs are conveyed on the Flint & Pere Marquette, the Mackinaw division of the Central, and other railroads. The C. N. Nelson Lumber Company will ship to Stillwater about 4,000,000 feet by rail, continuing the movement till Apil 1. The cost of rail shipment is about $1 a thousand more than by water, or $4,000 for the 4,000,000 feet. But the company no doubt expects to make up this additional cost by getting in ahead of rivals on the spring cut. It intends to have a quantity of lumber dry and ready for sale while the other fellows are driving the streams.—*Northwestern Lumberman.*

A FORESTRY BILL.

A bill known as the "Dakota Foresty Bill," has been introduced into Congress. It provides for the granting of 400 sections of unappropriated lands in Dakota to the coming state, to be immediately selected by the Secretary of the Interior, appraised and sold at their appraised value on ten years' annual payments, no deeds or patents to be given to the purchasers until after they have planted at least twelve acres of forest trees on each quarter section, and kept them in a good growing conditiou for at least eight years, the trees to be planted at such place or places on the quarter section as shall be designated at the time of the purchase by a Forestry Commission, for which the bill provides. The money derived from the sale of the lands is to form a fund, to be invested in Government bonds or other good securities, the interest on which is to be used for the establishment and maintenance of a school of forestry

and experimental stations. This institution is to be under the supervision of a board of three commissioners, two of whom are to be practical foresters, appointed by the president and confirmed by the Senate, and one appointed by the governor of the state of Dakota and confirmed by the highest branch of state legislature, the commissioners to hold the office for ten years, or during good behavior. If the proceeds of the lands sold for this purpose exceed $200,000, the excess is to be used in the construction of buildings and establishing of experimental forestry stations, if it be found necessary to do so. It is not expected that it will become a law by passing this Congress, but it is intended to press the matter in successive sessions.—*The Lumber World.*

DESERONTO.

The Belleville *Intelligencer* gives a full account of Messrs. Rathbun & Sons' mills at Deseronto, from which we take the following extracts:—

"The noise produced by the echo of the hammer and the movement of the hand-saw, greets the ear, as one approaches the vicinity of the big mill and on entering it the whizz of activity becomes conspicuously apparent. Here is a gang of stone cutters; there a party of masons; scattered promiscuously are laborers who distribute material where it is required. Carpenlers and joiners ply their avocations and tend their contributions to the hum that is all pervading.

The mill originally was 90x150 feet. An addition was subsequently made to it of 30x70 feet, and an extension of a like size is now being added. The exterior of the original building—or all that was left of it, that was in good condition—still stands; the contents of the interior have gone with their usefulness—to be supplanted with what is modern and better adapted for quick despatch and better progress. "To be abreast of the times" is a motto that the enterprising firm of Rathbun & Son aim to achieve, and, as a result, all the newst and most approved mechanical devices, innovations and appliances that can be procured are theirs. The firm is an embodiment of push and with capable and efficient managers controlling each department and a systematic style of management, it is not to be wondered at that the firm has gone on and prospered as it has. "It has resurrected Deseronto" and the mills are the life of the village. All the foundation timbers of the big mill are new; all the floor timbers are new and the flooring will be new. Two new abutments for the two new gangs, 18 feet square and nine feet deep, made of cut stone obtained near Shannonville, have just been completed. They rest on a foundation of oak, and the bolts by which the machinery is to be fastened go through them. The gangs will be of the most approved pattern—the Wicks Bro.'s patent. They possess an excellent motion created by oscillation, and are considered superior to anything in use in similar establishments in Canada. The rigging is very strong and durable, and is of cast iron. These gangs, instead of cutting one log at a time as formerly, will dissect six. Canting is dispensed with, as the stuff is carried by live rollers. The cut is taken by transfer chains from the slabbers to the gangs, instead of being handspiked as formerly. There will be two slabbers for one of the gangs, and a pair of twin circulars for the other, that will slab the sides of the logs. The machinery outfit of the mill will comprise an improved slabber, two gangs, two slabbers and two new circulars, all of the most improved type. All the cut will be transferred by machinery, and from the time a log leaves the water, no hand will touch it until the lumber is on the pile ready for shipment. The work of renovation was begun on the first of January, and will be finished by the first of April. Fifty men are employed in putting the mill in order, and the labor, improvements and machinery will cost $60,000. When the mill is in motion, it will cut 250,000 feet of lumber per day. The lath mill is an adjunct of the big mill and is now being provided with new machinery, which has been procured from Ottawa and other points in Ontario. In addition to turning out stuff for heading, sashes, blinds and panel material, it will daily contribute 150,000 lath. In the cedar mill there are 115 men and boys employed. Here are made lath, shingles, box stuff, ties and dimension timber of almost any size and length. The machinery in this is of the best pattern extant. The sash factory gives employment to 120 men and fills demands from all parts of the universe. It recently received an order for 1,000 glazed sash and 1,800 doors which are to be sent to South Africa, and is daily burdened with calls for doors and mouldings throughout the Province.

The Welland Vale works have given an order for 10,000 axe boxes, which are being made in the sash factory.

An immense quantity of lumber is piled along the docks.

Orders for house building material are numerous. "Necessaries" for eight structures have been provided during the past month.

An electric fire alarm system has been perfected by Mr. Rathbun and is in operation in all his places of business.

When the chemical works are in operation, the mills will be lighted with gas.

NEW BRUNSWICK'S FOREST WEALTH.

The St. John *Telegraph* of the 1st inst., states the clearances of lumber for trans-Atlantic ports from St. John for January, 1883, to have been as follows:—

Deals, battens, deal ends	3,910,839 sp ft.
Scantling and boards	41,379 "
Pine	300 tons.
Birch	272 "

The shipments were made in eight vessels of 5,047 tons. The largest shipment was to Bordeaux, to which port went 1,300,418 feet of deals and 40,998 of scantling and boards. Discoursing on "our forest wealth" the *Telegraph* says:—

The annual cut of spruce and pine lumber in this province, including what is used for domestic purposes as well as what is shipped abroad, probably averages over four hundred millions of superficial feet. The shipments last year of deals, etc., amounted to 375,864,368 sup. feet, and 45,000,000 sup. feet are estimated to be held over. The stock wintered over last season was 33,000,000, so that we find the cut for last year was 387,864,368 sup. feet, exclusive of the amount required for home consumption. How long the lumber lands of the province can stand this enormous drain is a question not readily answered; but it is evident that sooner or later the important industry of the manufacture and shipment of deals will be greatly curtailed. Under careful management, such for example as Mr. Gibson gives his reserves on the Nashwaak, the supply of spruce can be considerably prolonged, and it is to be regretted that no proper system of forestry has been adopted by the province, such as obtains in European countries, and is fitted to secure the co-operation of the lumbermen in the conservation of the forests. In view of the constantly increasing demands for lumber of all kinds on this continent, and the rapid exhaustion of the forests in the New England and Northern States, it is gratifying to know that this province possesses a vast store of wealth as yet comparatively untouched. The hardwood lands, of which there are millions of acres as yet unexplored, will, in the near future, take the place, in part, of the spruce lands.

It is impossible to give even a vague estimate of the amount of merchantable hardwood in this province, but it is enormous, and when it begins to find a market its manufacture will give employment to much capital and labour. In the northern part of the province alone there is a belt of land, irregular in outline, and broken by softwood land extending from the rear of the settlements on the St. John to those on the Bay of Chaleur, and containing fully two millions of acres, clothed with a forest of certain future value, and in every county there is more or less country of the same class. At the very moderate approximation of one thousand superficial feet per acre, the total amount of merchantable wood will be seen at once to be immense.

Wood and Coal.

The relative value of wood and coal has been made the subject of scientific investigation. It is stated as safe to assume that two and a quarter pounds of dry wood are equal to one pound of average quality of soft coal; and that the fuel value of the same weight of different woods is nearly the same, when dry; that is, a pound of pine is equal to a pound of hickory. The different woods weigh as follows, per cord: Hickory or hard maple, 4,508 pounds; white oak, 3,850 pounds; beech, red and black oak, 3,250 pounds; popular, chesnut and elm, 2,350 pounds; average of pine, 2,000 pounds. The value of these woods for fuel, as compared with coal, is given as follows: One cord of hickory or hard maple equals a ton of coal; white oak, 1,715 pounds; beech and red and black oak, 1,050 pounds; average pine, 925 pounds.—*Northwestern Lumberman.*

WORTH KNOWING.—A Fact Worth Knowing. The best household remedy known for Coughs, Colds, Bronchitis, Asthma, Whooping Cough and all throat and chest troubles tending toward Pulmonary Consumption is Hagyard's Pectoral Balsam, to be procured of any druggist.

DOORS, MOULDINGS, Etc.

WANTED AN AGENCY FOR ENGLAND for the sale of the above, by a gentleman with experience of the trade, large connections, and first-class references. Has worked the American Joinery for England for some years. Address D. M. 270, Messrs. Deacon's, 154 Leadenhall Street, London, England. 1L4

NOTICE.

SEALED TENDERS addressed to the Superintendent General of Indian Affairs, and endorsed "Tender for Indian Supplies," will be received at this office up to noon of SATURDAY, 10th MARCH, 1883, for the delivery of the usual Indian Supplies, duty paid, in Manitoba and the North-West Territories, consisting of Flour, Bacon, Groceries, Ammunition, Twine, Oxen, Cows, Bulls, Agricultural Implements, Tools, &c.

Forms of tender and full particulars relative to the Supplies reqnired, can be had by applying to the undersigned or to the Indian Superintendent, Winnipeg.

Each Tender must be accompanied by an accepted Cheque of a Canadian Bank for at least five per cent. on the amount of the tenders for Manitoba, and ten per cent. on the amount of the tenders for the North-West Territories, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to do the work contracted for. If the tender be not excepted the cheque will be returned.

The lowest or any tender not necessarily accepted.

[No newspaper to insert without special authority from this Department through the Queen's Printer.]

L. VANKOUGHNET,
Deputy of the Superintendent
General of Indian Affairs.

EAST PARADE,
SHEFFIELD, ENGLAND,
Solicitors to the said 6L3

THOMAS JOWITT & SONS

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily, and honorably. Address TRUE & Co., Augusta, Maine.

DISCUSSION ON TREES.

We take the fol owing from the annual report of the Fruit Growers' Association, of Ontario:

MR. BEADLE.—With regard to trees for towns and cities, the best growing tree, and the one which has been the most popular on that account, is the silver-leafed maple. It is sometimes called the soft maple, but there are other soft maples. The botanical name is *Acer dasycarpum*. It grows so fast that sometimes the branches split during high winds, and I have found it necessary to take the saw or the pruning knife to the trees and head them back so as to make them grow more compactly. If this were not such a fast age, and we were not in such a hurry to have shade trees, I would prefer the sugar maple. It is a more cleanly tree, if possible, than the silver maple. It does not sprawl much; it has a brighter and closer foliage, and, I think, is more symmetrical and beautiful to the eye. If you ask me what tree I would take next to that I get puzzled. There are several trees. There is a tree that we call the the ash-leaved maple. It is not a maple; it is not an ash. Botanists have put it under the head of *Negundo aceroides*. It is a hardy tree—I suppose a more hardy tree than the sugar maple. It will grow as far north as any tree can grow. It dres not make as large a tree as the sugar maple. It makes a very pretty medium-sized tree with a rather compact head and pinnate leaves. The prettiest native evergreen for ornamental planting is what is commonly called the hemlock, but it needs to be planted with some care. It needs nurses. If you take one hemlock tree in any part of the country and set it out on the lawn by itself, ten to one but it will die out; but if you will plant a little group of trees—a hemlock to each three or four Norway spruce—and let them grow together, and gradually cut out your Norway spruces so as to have a clump entirely of hemlock, after a while you will have one of the most graceful groups of the prettiest of all the evergreen tribe. Our balsam fir, while it is young, makes a pretty ornamental tree, but when it gets to be twenty-five or thirty years old it loses its lower branches and ceases to be an object of beauty. Our white spruce would be my choice in preference to the balsam fir. I think it will holds its limbs pretty well. It certainly will hold its limbs at the ground much longer than the native balsam. The Weymouth pine—our common pine—is a beautiful thing; but you ought not to plant it on small lawns. It is a beautiful tree planted alone, and allowed to have free scope to develop itself. Will it pay to plant the black walnut for commercial purposes? I suppose there are none of us who can speak from experience. If a man has a piece of land that is suitable for the black walnut and not so very suitable for tillage purposes, being broken and uneven, I believe that it will pay a person well who will take care of a plantation of that sort for twenty-five years. The wood, as we all know, commands a very high price in the market for the sake of the lumber it makes. It is continually growing scarcer, and the price is going up. I can see no reason why a plantation of that kind well taken care of should not pay well. I have heard it said that the nuts ought to pay something. If you go to a grocer in town and ask him for a bushel of black wal nuts he will charge you half a dollar for them; but I think you could scarcely sell ten bushels of them if you wanted to. Will it pay to plant the white ash for commercial purposes? We know that wood is used for almost everything, agricultural implements, carriage making—in every useful branch of industry where woodwork is wanted the white ash will come in play; and, I believe, under the same circumstances where black walnut might be made profitable white ash might be too. To the westward of us, in the United States—in those treeless prairies—they are planting the white ash very freely. They have great faith in it as a tree for forming shelter belts, as well as a timber tree. I believe the hickory would also pay. The nuts of that will sell for something. I do not know what the market price is. I know that the wood is being sought for for various purposes—for spokes of wheels, for felloes also, I believe—and for hammer handles, and that sort of thing. I believe a plantation of hickory on broken soil—on ground suitable for it—would be a profitable investment for a man to make. I think the time is coming when these subjects should be agitated and discussed. It would not take long to compute how much lumber you could get off a given acreage by knowing a little of the growth of these trees. I have been told about the hickory, that the demand for hoops is becoming so great that it would pay to set out a thick plantation of hickory trees, let them grow to perhaps a little thicker than your thumb, and then cut them down and split them in two hoops.

MR. DRURY,—There is one native evergreen which I think the secretary has overlooked—that is, the cedar. I was not aware, myself, until this last summer, that it was possible to get it to present such a fine appearance—not until I had an opportunity of visiting the farm of Mr. Dawson, in the county of Kent, about a mile from Chatham, There I saw cedars carefully trimmed and pruned to the most beautiful shapes. Of course, we know that if we allow a tree to grow as it will, without any pruning or shaping, it is not likely to present a very attractive appearance. The cedar is a tree that could be used for hedges. I do not say that it would be a lasting tree, but I have known it to last as a hedge for twelve or fourteen years. I saw a hedge of that sort on Mr. Dawson's farm. Near my own place a large orchard is partly enclosed by a cedar hedge, and it presents a very nice appearance. Then, too, I think the Secretary has hardly placed the spruce in its proper position as an ornamental native evergreen. The spruce, in my opinion, is one of the very finest native evergreens. Its color is very pleasing, and without giving it any attention it will grow into a very nice shape. I fully agree with what he has said in regard to the hemlock. The white pine also is a tree that can be pruned into shape. I have seen a very nice little arbour made by planting four or five pine trees in a circle, and then trimming the inside and the outside. This can be seen on Mr. Dawson's farm. I am disposed to think it would pay just at present to plant the white ash for commercial purposes, because it is a tree that is growing in considerable numbers in various parts of the country already.

MR. BEADLE.—Is it the red cedar you are speaking of?

MR. DRURY.—No; it is the white cedar—the *abor vitæ*.

MR. BEADLE.—It is the *arbor vitæ*, but not the white cedar; what is known by botanists as the white cedar does not grow here. The *arbor vitæ* would make a very pretty hedge, and bear trimming as you have said.

MR. BEALL.—Questions have very often been asked me within the last year or two as to what size the black walnut will attain in a given number of years. I have been endeavoring to find some answer to the question, but I have not succeeded very well. I am hoping, however to get more correct information from England on that subject. I think the probabilities are that there are English authorities more reliable than anything we have in this country as to our Canadian black walnut. We find that the Canadian black walnut was introduced into England in 1656; and I know of one tree that is about 153 years old, standing in England at the present time. That tree it now upwards of five feet in diameter. It is at Fulham Castle. It is now in a perfectly healthy condition.

MR. DEMPSEY.—We have in our neighborhood a black walnut tree—I could not tell you the age of it, but it is very little less than two feet in diameter at the base of the trunk. The limbs branch low—probably six or seven feet up. I asked the present owner of the property how old it was. He said, "Oh, I don't know; it must be about 120 years old, I think." I asked him how he knew. "Why," he said, "it was planted by my grandfather." "But," said I, "the county has not been inhabited more than seventy years." I think it was probably planted about seventy years ago. There is another tree I took Mr. Beall to look at, it is planted in another part of our county, which would make about two standard sawlogs. That tree also must be about seventy years old. There is a hickory tree that stands very near my house on a neighbor's premises, which forty years ago I saw an uncle of mine pruning up. It was a little bigger than my thumb at that time. That tree has more than twenty inches of diameter of trunk now. The whole tree is not standing; it forked, and in a heavy gale of wind it split down, and half of it has failed. I fancy that the black walnut or hickory could be brought up in thirty years—perhaps twenty years—to quite a commercial size, and I believe it would be profitable if properly cultivated; but it would be necessary to cultivate close so that the branches would not lie too low.

THE LUMBER TARIFF.

The Chicago *Northwestern Lumberman* of Jan. 27, says:—On Monday of this week, during the progress of the debate on the tariff bill in the Senate at Washington, the duty on lumber was discussed, mainly by Mr. Conger, of Michigan, and Mr. Van Wycke, of Nebraska. The Michigan senator, of course, favoured a continuance of the present duties on lumber, and the gentleman from Nebraska voiced the opinions of his prairie constituency. It is to be remarked that Mr. Conger held that there was still timber enough in the country to last 50 years, which hardly comports with Mr. Sargent's eight-year theory, that he is so industriously circulating in eastern journals. Neither does it accord with the position taken by the stumpage owners a year or so ago, when they desired to bull the market for both raw and manufactured material. There is a peculiar mixture in the motives of the pine interest these days, mainly owing to the tariff question. Before it came up in the present Congress there was scarcely a a stumpage owner to be found who did not predict the early extinction of the pine forests. That cry was on the wrong track as soon as the commission began to use palace cars and the club room at the hotels. It was then discovered to be logical that if our pine supply was becoming rapidly exhausted, free Canadian lumber would supplement it, and for that reason the consumers, especially in the timberless regions of the west, would have a right to clamor for the removal of duties on the Canadian product. Hence we find the pine interests blowing hot and cold nowadays—Mr. Conger, the Michigan valiant, stoutly maintaining in the Senate that the supply will last 50 years, while the lesser lights, like Mr. Sargent and his agents, and individual pine owners, who have not yet "got on to the racket," are still insisting that the pine forests of the country will have been utterly slaughtered in eight years.

The fact is that few outside the Saginaw valley interest, which Mr. Conger represents in the Senate, care much about the duty on lumber, for the reason that Canada lumber can never come into lasting and serious competition with the product from Lake Michigan westward. New York, New England and the Canadian Northwest will absorb the larger share of Dominion lumber, and there will be but little need for the mill men and merchants over the border to come west in search of customers, except in instances where there is special demand or local scarcity.

The success of Mr. Ingalls' motion to amend the bill so as to admit squared timber and sawed boards free of duty, was certainly a triumph for the advocates of free lumber, so far as the Senate is concerned. The action of the house in the matter, and the final fate of the amendment, will be awaited with much interest by all who are interested in pine.

FANCY WOODS.

The development of taste in matters relating to the internal woodwork of houses has of late years spread to floors, and parquetry floors have become the fashion. It may be expected that future taste will extend to the selection of coloured woods for the making of floors, and ere many years we may see such woods as mahogany, ebony, rosewood, walnut, teak, greenheart, birch, &c., bleuded together for the production of an artistic floor.

Judging from the direction public taste has of late followed, we should say that the business of the "fancy" wood merchant will develop in future years, and that instead of coloured woods being as now to a very great extent exclusively employed for cabinet purposes, they will be made very general use of for the internal woodwork of better class dwelling-houses. When the practice of introducing coloured woods into houses becomes generally adopted, the business of the "fancy" wood merchant will enormously develop, and then the tropical forest of Central America will be called upon for new large supplies.—*Timber Trades Journal.*

SOUTHERN PINE FORESTS.

The *Lumberman* will be much oblidged to one of its many readers in the south, providing he knows, if he will explain the absence of small pine trees in so many of the the yellow pine forests. This state of things is remarked on by every observer who visits the yellow pine woods. Several reasons have been given, but to the *Lumberman* they are unreasonable reasons. One is that the hogs, which are so abundant in the southern woods make food of the roots of the small trees as soon as they are old enough to have roots, and another is that the annual burning over of the forest lands destroys the young trees. When traced up, the hog theory is a poor one, for if yellow pine trees sprang up in the southern woods as white pine does in the white pine regions of the North, all the hogs would be kept very active, even if they set about to make the killing of the little trees their life work. The other theory is fallacious from the fact that in forests that are not burned yearly there are no young trees. The writer of this has ridden over thousands of acres of forests in the South that were so devoid of any kind of underbrush that it was difficult to get enough branches with which to decorate the horse's head. In the Northwest small trees are so plentiful that thousands, and probably millions, of them are cut annually when making roadways. The lumber business is a comparatively new one in the South, and considering the small number of infant trees found in the forests there, it is at least interesting to speculate as to what extent the forests, when once cut off, will reproduce themselves.—*Northwestern Lumberman.*

Managing Belts.

A mechanic gives the following directions for managing belts. He says: "I have for the last twenty-five years, on every Saturday evening, turned the inner side of my engine belt outside, let the engine run slowly, and washed the belt well with warm water and soda, applied with cotton waste. Next I take a piece of sheet metal and scrape the belt well, then wash with clean warm water and dry off. I collect the waste off from the shafting and apply as much of it to the belt as possible. The washing must be done as quickly as possible, so as not to dissolve the glued parts. I let the belt stand on the pulley till Monday, then give another scraping and turn the belt as before. I keep the pulleys very clean. I have long been surprised at the economy I have affected with very little trouble. I have not bought a new belt for the last ten years. There is an engine near me 14 inches by 36 inches (mine is 12 inches by 36 inches.) I have nearly double the shafting and belt, and my neighbor cannot run with less than 38 pounds of steam when all the belts are on loose pulleys. Mine will run at full speed with five pounds."

Art in Furniture.

In art furniture this country is steadily advancing. Cumbrousness has long been banished from our homes. Our furniture makers prove themselves fully equal to the production of the stately and picturesque furniture of the Elizabetian period; in addition to original designs free from all incongruousness effects. This country is rich in furniture woods, beautiful in grain and exceedingly diversified in color, ranging from the palest maple to the deepest and most lustrous hues.—*American Lumberman.*

LITTLE BY LITTLE.—The constant dropping of water will wear away even the hardest stone. So the constant irritation of a cough will so wear upon the lungs as to induce incurable Consumption. Hagyard's Pectoral Balsam will cure the worst cough, speedily and effectually.

MR. THOMAS W. RACE, Editor and Proprietor of the Mitchell *Recorder*, writes that he had a prejudice against Patent Medicines, but being induced to try Burdock Blood Bitters, for Billiousness that occasioned such violent headache and distress as to often disable him from work. The medicine gave him relief, and he now speaks of it in the most favorable terms.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Dec., and for the first 12 months of the year :—

MONTH ENDED 31ST DEC., 1882.

	Quantity. Loads.	Value. £.
Timber (Hewn).		
Russia	7,660	17,605
Sweden and Norway	24,409	39,566
Germany	16,026	46,974
United States	5,252	21,746
British India	2,499	35,210
British North America	29,550	146,065
Other Countries	35,936	40,784
Total	121,332	347,950
Timber (Sawn or Split, Planed or Dressed).		
Russia	26,747	63,543
Sweden and Norway	56,507	147,868
British North America	90,378	233,590
Other Countries	18,592	60,254
Total	192,224	505,255
Staves, (all sizes)	6,992	39,120
Mahogany (tons)	2,777	27,554
Total of Hewn and Sawn	313,556	853,205

12 MONTHS ENDED 31ST DEC., 1882.

Timber (Hewn).		
Russia	299,588	629,626
Sweden and Norway	609,187	968,906
Germany	297,031	844,425
United States	155,422	544,215
British India	39,918	512,339
British North America	277,745	1,348,564
Other Countries	339,516	429,748
Total	2,018,407	5,277,823
Timber (Sawn or Split, Planed or Dressed).		
Russia	1,178,318	2,971,737
Sweden and Norway	1,652,933	4,156,456
British North America	1,010,413	2,692,049
Other Countries	335,096	1,072,008
Total	4,176,760	10,892,250
Staves (all sizes)	125,696	647,227
Mahogany (tons)	36,004	351,000
Total of Hewn and Sawn	6,195,167	16,170,073

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* says :—The one great determining fact which stands boldly out in relief is the enormous production of sawn and planed lumber in Sweden in 1882, and which was doubtless greater by over 100,000 Petersburg standards than in any preceeding season. This is clear from the following comparative return of export for the first eleven months of the last six seasons, viz. :—

	1882 Stds.	1881 Stds.	1880 Stds.
Sawn and planed wood	715,000	611,000	632,000
Hewn wood	105,100	89,700	102,600
	1879	1878	1877
Sawn and planed wood	620,000	556,000	637,000
Hewn wood	72,500	74,000	111,000

(The hewn wood is calculated per standard of 150 and the sawn, &c., per standard of 165 cubic feet.)

Estimate of first open water stocks of sawn and planed wood in the north of Sweden :—1882, 356,252 standards ; 1883, 404,704 standards.

The above results have been rendered possible by the uncommonly successful manner in which floating was carried on in the past season, as well as by the long and favourable shipping period. This immense export could not naturally fail to bring prices down somewhat towards the close of the season from the comparatively high limit at which the larger productions were mostly sold early in the year. Importers who bought largely under the expectation of a very heavy consumption, and which was but partially realized both in France and England, may thank their stars that circumstances were against consignment shipments in autumn, otherwise prices would probably have given way sufficiently to have caused financial embarrassment to some of the younger importing firms in Britain that bought so largely.

THE *Northwestern Lumberman* says :—The Muskegon Car Works recently received from Kansas City an order for 350 freight cars, which is being filled as rapidly as possible. The company is considering an order from one company for 500 freight cars, and is negotiating to build street cars for several cities. If the Muskegon builders are not specially favored with orders, the car-building industry must be looking up,

Chips.

THE *Northwestern Lumberman* says that the snow is reported so deep in the Duluth district beyond the Northern Pacific junction that the skidding of logs has become difficult.

THE 1882 cut of pine in Michigan, Wisconsin and Minnesota will amount to about 10,000,000,000 feet, against 7,768,000,000 feet last year, and everybody wonders how long it can go on.

SINCE it has become possible to transport lumber cut in east Tennessee, the timber interests are developing rapidly. Many new mills have been built, and the supply seems almost inexhaustible.

THE shipments of forest products to foreign ports, from Puget Sound, as reported to the Port Townsend custom house for 1882, were as follows : Lumber, 59,064,000 feet ; lath and pickets, 3,869,000 ; shingles, 4,090,000.

ON the north branch of the Cedar, in Michigan, there is a log jam of four or five miles in extent. The Rust, Eaton & Co. dam was opened January 14, but the freeze-up was of a too positive character to make the move of immediate benefit.

THE pine land suit between A. J. Fair, of Detroit, and John Whyte, of Ridgetown, Ont., in the United States Court, has been settled, Mr. Whyte making a reduction of $15,750 on his claim. Fair loses about $7,000, but will resume business on a sound footing.

LEWIS SANDS, a prominent Michigan lumberman, has agreed to advance $200,000 to John Adams, of Winnipeg, for the purpose of working the latter's timber limit of 37½ square miles, near the Cypress Hills, N. W. T. It is intended to commence the erection of mills at once and push on developing the limit.

DURING the yellow-fever epidemic at Pensacola, Fla., millions of feet of timber accumulated in Covington county, Ala., and the country bordering on the Conecuh river, waiting the subsidence of the scourge to be floated down, and which is now going forward. These retarding operations will result in something of a boom.

ABOUT one-half of the stock expected to be got out on the Menominee river, Winnipeg, is now banked, estimated at 200,000,000 feet. There is about two and a half feet of light, dry snow in the woods. The weather is extremely cold, which makes hard hauling, but the operators are icing their logging roads wherever practicable, to obviate this. On the whole, the outlook is favorable for a larger crop of logs than was started in for.

THE Montreal *Gazette* says :—Mr. Senecal is reported to have purchased the lands of the Hall estate, which comprise some of the finest timber districts and agricultural tracts in the province, including the Gatineau mills and river frontage at Quebec suitable for elevators and wharhouses. The purchase, which is placed at the high figure of $2,000,000, has been made on behalf of a colonization company represented by Mr. Senecal.

THE Northern Pacific road is adapting the forestry idea to a somewhat new and practical end. It is planting trees as a defence against future snow-drifts. The company has had gangs of planters at work during the fall, and intends continuing the plan every season. Bonus is also offered settlers on the company's land grants to encourage the planting. A forest of well-grown trees will prove the most effective snow-shed possible, while it will cost less, last longer, and grow constantly in material value.

THE *Northwestern Lumberman* says :—The belief is general among manufacturers that the price of lumber the coming season will rule lower than in 1882, but with hardly an exception they are of the opinion that the consumption of lumber will be something to be talked about in after years. There are many indications that an immense amount of lumber will be sold the coming season, but there is liable to be some disappointment on the part of members of the wholesale trade in certain directions. There is a large quantity of lumber beyond the Mississippi river, and should the consumption in that territory be very large, the trade of the dealers who look to that section for customers will not bear the usual proportion to it.

Market Reports.

TORONTO.

From Our Own Correspondent.

FEB. 9.—There is little worthy of record in lumber matters to give you at present, and about the only paying business in the wood line just now is that of cordwood; owing to the severe wintry weather a thriving trade is being done by the coal and wood dealers, and lumber dealers are looking quite glum in consequence of their enforced idleness. There is scarcely anything coming in by rail, as all the railroads running into the lumbering districts are completely blocked with snow. Operations in the woods are also at a standstill in consequence of the great depth of snow, and perhaps it is just as well that the elements has done for the lumberman that which he was unwilling to do for himself, viz., curtailed the quantity originally intended to have been got out. The retailer will not have cause for complaint either, when the spring opens there will be a general rush and the building trade will resume more than its wonted activity. Some dealers have felt like trimming their sails in view of lower prices with the opening spring trade, but I for one feel positive that prices will hold up during the coming spring and summer months. Little anxiety may be felt on that score. Prices remain firm at last quotations:

MONTREAL.

From Our Own Correspondent.

FEB. 10.—Since the date of our last report we have had steady cold weather, and in some regions heavy snow storms have prevailed and fears are entertained that the snow will be so deep as to make hauling a matter of some difficulty. Business here has been very quiet, nothing reported beyond the usual retail demand, which has not been very active since the date of our last report, but this is usually the case at this season of the year. The prospects are good for the trade as soon as spring opens. We have no change to make in our quotations which are firm and steady as under, ex yard:—

Pine, 1st quality, ℔ M	$35 00@40 00
Pine, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00

CORDWOOD.

The Grand Trunk Railway, having to a great extent given up burning wood, are now bringing in a large quantity of cordwood, so that stocks are likely to be more ample, and probably will have the effect of bringing down prices, and were it not for these supplies which are coming in from Richmond, Windsor and Acton, we would this week have had to report an advance in price; as it is some retail dealers are asking an advance for long wood. The retail trade has been very dull for the past two weeks. Wood in the country is plentiful if we have not too much snow to get it out of the bush. Prices remain steady as follows:—

Long Maple	$7 50
Short "	7 00
Long Birch	7 00
Short "	6 50
Long Beech	6 50
Short "	6 00
Long Tamarack	6 50
Short "	5 00

OTTAWA.

From Our own Correspondent.

FEB. 9.—A case is now before the court here which is of the greatest importance to lumbermen. Ever since the lumbering interest of the Ottawa Valley was first developed numerous mean individuals have plied the nefarious occupation of stealing and making use of saw logs along the banks of the main river and on the streams. The number misappropriated in this manner has been enormous. These parties who would be more familiarly named as pirates of the Upper Ottawa, have made so bold at times as even to erect small mills to cut up their ill-gotten timber. The lumbermen and limit owners have united of late years and gradually the grievance is abating. Many prosecution cases have come before the courts at different times, but strange to relate the convictions of the accused by juries have not been of great number. A man named Rowan who lives in Fitzroy township, appeared before the court here a few days ago, to answer the charge of feloniously stealing a number of saw logs. Indictments were taken out against him by five different lumbering firms, among them Messrs. Bronson & Weston, E. B. Eddy, Perley & Pattee. The defendant has been committed for trial and his trial will come off at the next assizes. The lumbermen are bound to prosecute to the last all such cases that are heard of in future.

Your correspondent had a conversation to-day with a lumbermen who has just returned from the woods. He said that the prospects for a very large output of lumber this season were excellent, and almost unprecedented. The different shanties in operation—larger in number than any previous season—were meeting with much success. As to the alarming reports of dangerous diseases being prevalent in certain localities he could say that there were no grounds for such reports. He entertained a rather gloomy outlook, however, for the future of this city as a centre for the manufacture of lumber, believing that the mill owners would in a few years be compelled to follow up the timber with their mills.

The British Canadian Lumbering Co., headquarters in Toronto, have purchased the extensive saw mill near this city known as Eddy's South Shore Mill. It formerly belonged to Senator Skead, but has been operated for the past five years by Mr. E. B. Eddy. The price paid was about $100,000.

Mr. J. Poupore, Crown Timber Agent at this city, has issued a statement of the revenue accrued in 1882 classified to revenue as now divided to Quebec, Ontario and the Dominion. It is as follows:—

	Quebec.	*Ontario.*	*Dominion.*
Saw Logs	$327,378.26	$189,769.54	None
Ground Rents	41,973.95	14,587.12	None
Booms	116,208.00	3,400.00	None
From Indian Land's Ground Rents			$ 6,100
Timber Dues			79,349
Slides and boom dues			83,000.44
Total, Quebec	$ 368,315.30		
Total, Ontario	2,042,380.76		
Total, Dominion	83,854.93		

Collections for A. J. Russell and John Poupore, by H. J. Chaloner, at Quebec, after adjustment at Ottawa. Quebec, $89,249,.41; Ontario, $65,778.21. Slide and boom dues on bonds taken at Ottawa—Dominion, $30,049.68. Grand total, Quebec, $457,564.71; Ontario, $270,158.87; Dominion, $114,004.61.

BOSTON.

Cotton Wool and Iron says:—Operations are of a very restricted character in almost every department. The season is unfavorable to outside business, and consumers are only ordering as a rule what they require for their present limited wants. At the latter part of February there is likely to be a moderate start-up in trade. At the sheds of the different railroad corporations there is a large stock of lumber on storage. Good grades seem to be held pretty steady, with calls slow and irregular. Furniture manufacturers are beginning to make inquiries for hardwoods, in anticipation of active operations, and prices for desirable grades seem to hold their own quite well. Pine is quiet but fairly steady. The prospect is that building operations will be pretty active the coming season if prices are favorable. There is quiet a demand for medium and low cost houses in the city and suburbs.

CHICAGO.

The *Northwestern Lumberman* says:—Yard men are purchasing next to no lumber for the coming season's sales. The manufacturers on the east shore are still in possession of their stocks, with the prospect of having plenty of dry lumber on hand next June. The wholesale dealers of this city expect to see this lumber coming to the docks here in heavy volume after the opening of navigation, and are preparing to give it a regular white-bear pounding when it does come. The manufacturers themselves acknowledge that there is a prodigious stock of lumber in the country, and are openly predicting a lower range of market values next season. The markets of the interior are watching the attitude of the Chicago Exchange, and whenever a change is made in the list here, it will be quickly followed at other points. All over the Northwest lumber is selling at an average of about $1.50 below the various printed lists, with the exception of the one at Stevens Point, Wis., and possibly others at unimportant points.

The prospect of the abrogation of the lumber tariff has excited the manufacturers of Michigan and eastern Wisconsin districts to a considerable degree, and an effort to stir up and bring to bear an effectual opposition to the measure, has been made in the Saginaw valley and this city. The agitation of this question just now serves to intensify the uncertainty in regard to the near future of the lumber business.

The intensely cold wave, which for the past two weeks has demanded all the energies of the dwellers in the northern states in the effort to keep warm, has militated against the shipment of lumber to Chicago as well as elsewhere, the receipts of the past week being only about 50 per cent. of the amount received during the corresponding week of 1882, while the total receipts of the month show a falling off of 25 per cent. in lumber and 13 per cent. in shingles in the comparison between the two years. The larger part of the lumber received during the winter is of hardwoods and southern pine, although a small proportion is of special bills of white pine which have been sawed to order.

Receipts and stock on hand of lumber and shingles, etc., for the week ending Jan. 18, as reported by the Lumberman's Exchange:—

THE LIVERPOOL TRADE.

We take the following from the annual review of the *Timber Trades Journal*:—After reviewing the course of business in the timber trade for the past year, we can hardly avoid coming to the conclusion that it must be regarded as a disappointing one. The building trade has been in a most unsatisfactory condition, as the numerous failures of builders testify, and with the long credit given by the trade, even to the lowest class of consumers, some of the merchants have unfortunately figured in the lists of creditors with a frequency most disheartening. That this long credit system is not shortened is a fact that is admitted by every one, excepting perhaps the buyers; but it is certainly a state of matters to be greatly deplored that no joint action is taken by those most deeply interested to bring about some considerable curtailment of what is known as "Liverpool terms," *i.e.*, six months' credit. But such is the keenness of competition that, if such an arrangement were entered into, doubtless some one would be found to "keep the word of promise to the ear and break it to the hope," and the evil would again spring up in form as rank as ever.

Amongst the most striking features of the trade during the past year has been the extensive employment of steam tonnage in conveying not only cargoes of deals across the Atlantic, but pitch pine timber from the ports in the Gulf of Mexico, to which reference is made in more detail below under their separate heads.

Turning now to the details of the most important articles of our trade, we commence with

CANADIAN WOODS.—The importation of Quebec yellow pine, including both waney board and square timber, has been about 36,590 logs during the past year, against 30,594 logs in 1881, and 48,147 in 1880. There has been a very steady demand throughout the year, although prices have been high in comparison with previous seasons, and there is evidence that prices quite equal to, if not in excess of, these will have to be paid in future.

The stock on hand now is only 292,000 ft. of square and 275,000 ft. of waney, as against 348,000 ft. of square and 353,000 ft. of waney last year at this time, or a decrease of nearly 20 per cent., and as the cost of production is increasing year by year, owing to the high prices demanded for labour, the greater distance from which this timber has to be drawn to the rivers,

and other expenses in like proportion, we need not expect to see prices any lower, especially as the past season opened with freights at a very moderate rate.

The quantity of St. John, N. B., yellow pino imported, shows a slight increase over that of last year, but is below that of the previous one; but this favourito wood has now become so difficult to procure that it is confined to very few hands.

Red Pine Timber, which once formed a considerable item in the Canadian imports, has become a very insignificant factor, owing to the better sizes, cleaner growth, and above all the lower price at which pitch pine can now be had, in point of fact it bids fair to supersede it in most directions. The stock on hand has accumulated from 26,000 ft. last year to 65,000 ft. this year, whilst the consumption during December, 1882, amounted only to 3,000 ft.

Canadian Oak has been in fair demand during the year, notwithstanding the high cost of importation, and prices have not fluctuated greatly, the range being from about 2s. 11d. to 3s. 2d. per foot for prime qualities of ordinary average size. The consumption of this wood for waggon-building purposes is, however, becoming year by year interfered with by the growing favour in which scantling, cut to the exact sizes required, is now asserting itself. The stock on hand is about the same as that of last year, viz., 335,000 ft., against 347,000 ft. in 1881.

Birch has throughout the year maintained a high average price, and as there has been a steady and at times a strong demand for this wood, most of the importations have gone rapidly into consumption as soon as landed. The stock is very moderate, being only 102,000 cubic feet, and as advices from St. John, N.B., point to a continuance of high cost of production, there is every likelihood that we shall not see any fall in value for a long time to come.

Pine Deals show a decrease in the quantity imported during the two previous years, the quantities, including Quebec spruce and red pine, being in 1882, 1,128,480 pieces; in 1881, 1,268,513 pieces; and in 1880, 1,767,366 pieces; and, as the imports of Quebec spruce and red pine have been in excess of the usual quantity, the decrease in pine is in reality larger than it would appear from the figures above quoted. The stock on hand of Quebec deals includes, as do the figures of import, also all the Quebec spruce and red pine deals, and as these are estimated at about 1,000 standards, it brings down the actual stock of yellow pine deals to less than that of last year, when there was but a limited quantity of Quebec spruce and red pine deals on hand. The demand throughout the year has been fair, but the prices obtainable here have not left much margin for profit, and consumers of these goods have no causes to regret their purchases during the past season.

Spruce Deals.—The import for the past year has been 5,413,005 pieces, against 4,660,126 pieces in 1881, and 6,130,917 pieces in 1880, that is to say, it has been an average of the two previous years. We commenced the year with a moderate stock on hand of only 16,000 standards, about one-half the quantity held at the commencement of 1881, and although there was a fair demand, prices did not advance during the first three months of the year to a point satisfactory to shippers, and as might naturally have been expected looking at the exceedingly light stock held at the end of March, when it had dwindled down to only 10,400 standards. Any hope of a rise in the market was about that time shattered by the sudden engagement of large quantities of steam tonnage at very low rates of freight, which had been released from its ordinary employment by the stoppage of shipments of grain from the United States, owing to the action of a "ring" who tried to "corner" that market. We then saw the unusual sight of large steamers of 1,200 to 2,000 tons register discharging entire cargoes of spruce deals, and then even these were surpassed in size by the engagement of Messrs. Geo. Warren & Co's. steamers Kansas, of 3,455 tons, and Missouri, 3,331 tons register, each vessel carrying 1,400 to 1,500 standards of deals. Under the pressure to sell consequent upon this state of matters prices gave way until the beginning of July, when the grain market in the United States suddenly demanded its more than usual amount of tonnage, to carry off its accumulations, and this not only rid the timber trade of all its steam tonnage, but drew largely upon the better class of sailing vessels, and in consequence thereof freights went up with a bound of over 15s. per standard on previous rates, with the natural result that by the beginning of August our market displayed an amount of animation to which it had been a stranger, and a corresponding advance in prices soon manifested itself, so that St. John, N. B., deals sold in cargoes at £8 10s. per standard, or an advance from the lowest rates of about 25s. per standard. This state of matters did not, however, last long, as by tho commencement of the last quarter of the year prices began to decline under the increased importation, chiefly consisting of Lower Port goods, and, as this has been well kept up, the market has steadily weakened, until the rates at the close of the year are below what they were at the beginning, and we end with having a stock of spruce deals of all kinds estimated at about 22,000 standards, or about 25 per cent. more than we had at the end of 1881. The failures of two houses engaged largely in the importation of these goods, viz., Messrs. Peter Sutherland, jun., & Co., and Messrs. Carvill Brothers, have no doubt contributed greatly to this result, as both firms towards the termination of their business naturally pressed their goods on the market with great force.

Pitch Pine.—The importation has been very large, reaching the enormous quantity of 86,435 logs, compared with about 68,000 logs in 1881, and 59,000 logs in 1880. This is a startling increase, which should be duly weighed by the shippers of this wood in the United States, for it is quite evident that, large as are the resources of the Liverpool market, there is a limit even to its capacity for swallowing gigantic supplies such as those in question, and it might be said, without wandering far from literal accuracy, that cargoes have been sent into port without cessation for the whole of the past year.

With regard to North of Europe woods, the import of fir timber has been light, only 12,290 logs being landed, against 13,043 in 1881, and 33,757 logs in 1880. Trivial as this may appear, it has proved more than enough for the demand, as the stock on hand is now 59,000 ft., against 50,000 ft. last year. That such goods as Memel and Dantzig fir are rapidly losing the position they once held becomes every year more apparent, as neither in price nor in dimension can they compete with pitch pine, which is now being extensively used as a substitute. There is very little disposition to buy for spring shipment at the present f.o.b. prices asked by the Baltic houses.

Redwood Deals.—These have been imported in much larger quantities than in the previous year, and slightly in access of 1880, the figures being 772,886 pieces, 248,059 pieces, and 715,664 pieces respectively for the years 1882, 1881 and 1880, and a very large proportion of this increase has been in Finland goods, the low prices at which Uleaborg, Tornea, and similar have been sold proving a ssrong temptation to this market, where there is always a demand for cheap goods. The stock, however, of deals and boards together is about 47½ per cent. more than that of last year, when it consisted of 3,311 standards, whereas it now stands at 4,894 stds.

Norwegian Flooring has been unduly pressed upon an already well-supplied market, and prices, especially towards the end of the year, have given way. For cargoes of all white, with a large proportion of 3rds and narrows, shippers are now asking £8 10s. per standard, c.i.f. for 1st whito 6½ and 7×1, other qualities and dimensions with tho customary additions and reductions; but the price, moderate though it may appear, is not obtainable for f.o.w. shipments. This stock too is largely in access of last year, say 2,861 standards now, against 1,693 standards in 1881, or 60 per cent. additional.

American Black Walnut Wood has been imported very extensively, and although prime qualities have realized high prices, they have not always been satisfactory to the shippers, for not only is there a strong market for this wood in the United States, but the Continental markets, especially the German ports have, with few exceptional times, offered better inducements than this country.

JONES & SON,

Wholesale Lumber & Timber Dealers

39 Broadway, NEW YORK.

Oak, Ash, Cherry, Black Walnut, Poplar, Butternut

And all other Kinds of HARDWOOD LUMBER.

White and Yellow Pine Lumber and Timber.

PERRY DAVIS'
VEGETABLE
PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

PARRY SOUND.

The *North Star* says:—Extensive improvements are being made in the Parry Sound Lumber company's mills. In the water mill, the location of some of the gangs is being changed and fresh rock-bolting and strengthening is being done. The steam mill is being entirely rebuilt and refitted, and when completed will make one of the most convenient mills in Canada.

The Parry Sound River Improvement Company are applying for incorporation under the provisions of the Ontario Joint Stock Companies' Letters Patent Act. They propose to operate all rivers and streams between Moon River and Shawanaga River.

Snow is so deep in the woods now as to materially interfere with lumbering operations.

Smallpox in the Lumber Camps.

St. Paul, Minn., Feb. 8.—There is great excitement in the lumber camps in the upper Mississippi country on account of the spreading of smallpox. A committee has arrived from Aitken, to urge the importance of grappling with it at once. At Caldwell's camp, in Big Fork, there have been eleven cases and eight deaths. Three Indians caught the disease and carried it to Lake Winnebagoshiah, where the deaths already among the Indians number thirteen. It is almost certain that fatality accompanies the disease among the Indians. Cold Devil Camp is broken up. The lumbermen travelled 100 miles in the deep snow, the temperature below zero, being refused accommodation by the way. There are 2,000 lumbermen in the lumber regions in the upper Mississippi, and a stampede is feared which will spread the disease widely.

The Longest Bridge in the World

China possesses the longest bridge in the world It is at Langang, over an arm of the China Sea, and is 5 miles long, built entirely of stone, 70 feet high, with a roadway 70 feet wide, and has 300 arches. The parapet is a balustrade, and each of the pillars, which are 75 feet apart, supports a pedestal on which is placed a lion, 21 feet long, made of one block of marble.

Good Advice.—If our readers will accept proffered advice, they will always keep a bottle of Hagyard's Yellow Oil at hand for use in emergencies, such as Burns, Scalds, Wounds, Lameness, Croup, Chilblains, Rheumatism and all varieties of aches, pains and inflammations. It will ever be found reliable.

PLANTING FORESTS TREES.

At the annual meeting of this year or the Ontario Fruit Growers and Forestry Association:—"The best variety of forest trees to plant for ornament and for profit" was then considered. Mr. Gott spoke of the many beautiful varieties of trees which were proper for shade and ornament, among others being mentioned French spruce, white walnut, the different varieties of pine, basswood, Canada balsam, etc.

Mr. Reesor, while endorsing mainly the suggestions of the preceding speaker, dissented from him so far as the Canada balsam was concerned, as he considered it a most worthless tree.

Mr. Arnold spoke in favour of the magnolia, walnut, and Austrian pine.

Mr. Roy spoke of the beauty of the Austrian pine as an ornamental tree. He also recommended the cultivation of walnut trees both as ornaments and as a paying investment.

Mr. Smith recommended the growing of the poplar both as a shade tree and for its pecuniary value, as it was used very extensively in pulp mills for making paper.

Mr. Bucke stated that, independent of its beauty, the basswood had great economic value. In the Georgetown mills more than half the pulp used in the making of paper was produced from basswood, which was now worth from $4 to $5 per cord.

Mr. Wright stated that besides its beauty the basswood was very valuable as bee pasture, which was a very important consideration in a northern country, where they could not grow such a variety of flowers as in more southern sections.

Rev. Dr. Wild, being present, was requested to address the Association. He stated that he was deeply interested in trees, and had a very extensive collection himself in his orchard. He considered that the destruction of forest trees in Canada was a very serious evil, and had an injurious effect even so far as climate was concerned. He read everything relating to tree culture as carefully as he did matters relating to theology, and thought that man's moral and social condition was affected in no remote degree by his surroundings, among which none were more favourable for a development of taste for the beautiful than trees. The doctor, in conclusion, wished the Association success in their deliberations and gave them his hearty sympathy in their efforts to encourage the cultivation of ornamental and useful trees.

Mr. Dempsey thought that if the legislature enacted a law by which a fine of $10 would be imposed for defacing or destroying trees growing by the roadside it would prevent an obstacle to their growth much more serious even than the destructive attacks of cattle.

Mr. Drury, M. P. P., spoke of the Act recently passed by the legislature relating to the planting of trees by the roads. The effect of such growth of trees in enhancing the value of land and increasing the beauty of the country was ably remarked, and in conclusion the speaker expressed the opinion that within a year many municipalities all over the country would take action upon the bill, and encourage by all possible means the planting and cultivation of trees. If the meeting of the Association resulted in nothing else but in awakening a public interest in tree planting it would have accomplished much.

It was then moved by Henry Slight, seconded by W. Pemberton Page, "That the Fruit Growers' and Forestry Association protest strongly against the reckless way in which the telegraph companies unnecessarily destroy trees, in our street in towns and on the country roads; and that the Dominion Government be memorialized in relation to the matter.

FREE LUMBER.

The Port Huron *Times* says: "Senator Conger fought hard to prevent the senate from voting to put lumber on the free list, but did not succeed. To take off the tariff on lumber will be to raise the price of lumber in Canada and lower it but slightly here. The benefit will be almost entirely to the Canadians, and very little or none at all to consumers in the United States."

The above is most certainly a forced construction of the effect of the free lumber section of the tariff bill, at least so far as this country is concerned. While that clause, if finally adopted, might raise the price of lumber somewhat in Canada, yet the inevitable result would be to lower the price not only of lumber itself in this country, but also of labor, to correspond with that of Canada. It is fraught with the most serious results to about one million men, who are dependent upon the lumber industry for support for themselves and families. It is certainly unjust to the American manufacturer to admit Canadian lumber free into the United States while the Canadian government retains a tax on lumber imported into Winnipeg and other portions of the Dominion where there is at present a demand for the same. It is virtually passing over the control of the lumber market in the east to the Canadian producer. It also enables them to lay heavy hands on the western market, because they are enabled to exclude the American product from the places alluded to by a tax, while their own lumber may be sent there free from any such obstruction.—*Lumberman's Gazette.*

HOW CLOTHES-PINS ARE MADE.

A writer thus describes a clothes-pin factory: The process of making the pins is a very interesting one. The wood used is mainly white birch and beech. The logs are cut and hauled to the shores of the lake or streams emptying into it, whence they are floated down to the mill. As fast as required they are hauled into the mill by a windlass and chain, worked by steam power, and sawed into lengths of sixteen or twenty-two inches, the former to be made into pins, and the latter into boards for the boxes required in packing. The sixteen inch lengths are next sawed into boards of the required thickness by a single machine, then into strips of the proper size by a gang of twelve circular saws, and finally into five-inch lengths by a gang of three saws. The logs have now been cut up into blocks about five inches long and three-fourths of an inch square. Falling as they leave the saws on to an elevator belt, they are carried into an upper story, and, returning to the first floor, are deposited in troughs, whence they are fed to the turning lathes, of which there are several, each being capable of turning eighty pins per minute. They are then passed to the slotting machines, in which a peculiar arrangement of knives inserted in a circular saw gives the slot the proper flange, after which they are automatically carried by elevator belts to the drying bins on the second floor, where they are subjected to a higher temperature, generated by steam pipes, until thoroughly seasoned. There are several of these bins, the largest of which has a capacity of 100 boxes (72,000 pins) and the smaller ones fifty.

The pins are now ready for polishing and packing. The polishing is accomplished by means of perforated cylinders or drums, each capable of holding forty bushels, in which the pins are placed and kept constantly revolving until they become as smooth as if polished by hand with the finest sandpaper. A few minutes before this process is completed a small amount of tallow is thrown in the drums with the pins, after which a few more revolutions gives them a beautiful glossy appearance. The polishing drums are suspended directly over the packing counter on the first floor of the mill, and being thus immediately beneath the ceiling of the floor above, are readily filled through scuttles from the drying bins on the second floor, and as easily emptied upon the counter below, where they are sorted into first and second grades and packed in boxes of five gross each. The sorting and packing are done by girls; 250 boxes are packed per day.

The London *Timber Trades Journal* says:—Complaints have reached us of the lengths of several cargoes of deal ends running some inches short. It is most important that shippers abroad should carefully attend to the cutting of the ends to their proper and specified lengths, as not only is the loss of wood a serious matter, occurring as it does in ends so frequently, but the loss of labor in selecting out and laying aside the short lengths seriously adds to the cost of using them.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

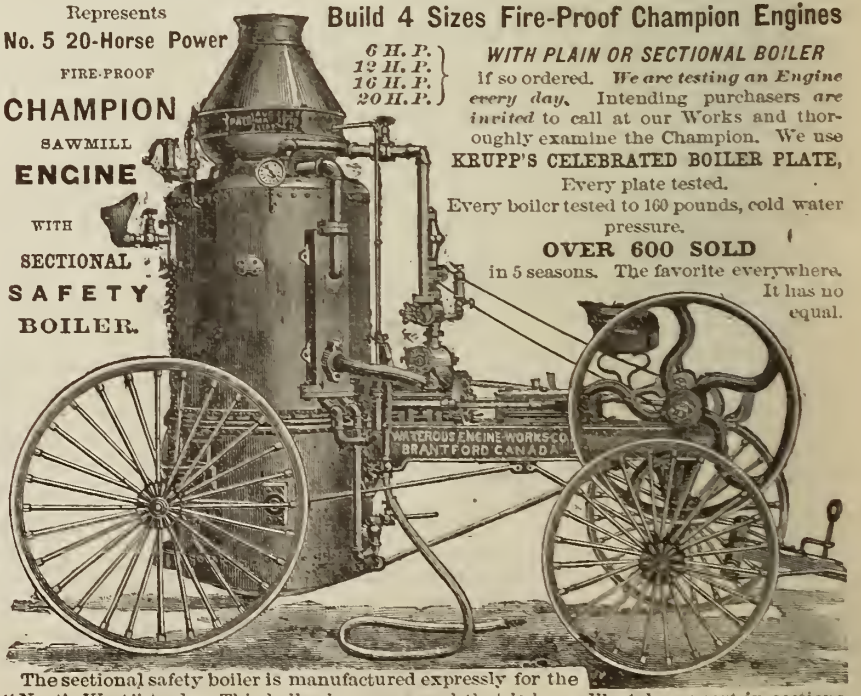
CHAMPION SAWMILL ENGINE WITH SECTIONAL SAFETY BOILER.

Build 4 Sizes Fire-Proof Champion Engines

6 H. P.
12 H. P.
16 H. P.
20 H. P.

WITH PLAIN OR SECTIONAL BOILER if so ordered. *We are testing an Engine every day.* Intending purchasers *are invited* to call at our Works and thoroughly examine the Champion. We use KRUPP'S CELEBRATED BOILER PLATE, Every plate tested. Every boiler tested to 160 pounds, cold water pressure.

OVER 600 SOLD in 5 seasons. The favorite everywhere. It has no equal.



The sectional safety boiler is manufactured expressly for the "North West" trade. This boiler is so arranged that it is readily taken apart in sections enabling purchasers to clean thoroughly every part of it and prevent burning out. *We know from experience this is absolutely necessary with the alkaline waters of the great Western prairies.* Largely used by the Pacific Railway Company and all the large Colonization and Ranche Companies.

FREE LUMBER AND FOREST PRESERVATION.

There has been abroad in the land for a few years a number of people who have gone daft with the idea that the forests of America are being denuded at a tremendous rate and that if something is not instantly done the continent will speedily become a sahara of desolation. The idea popped up in the senate the other day as an argument in favour of placing lumber on the free list. The thought of the statesman that introduced it seemed to be that it would be altogether generous and politic for the United States to admit Canada lumber free, and encourage the people of the Dominion to destroy their country by stripping it of its forests. It never seemed to have occurred to the Deleware Senator that it was quite as important to preserve the Canadian forests as the forests of the United States, the former exerting rather more influence upon the climate of the continent than the latter. Ingalls, of Kansas, a state whose forests were destroyed centuries ago, or never existed, but which seems to be progressing pretty well without them, caught on to Bayard's notion that "there was a striking inconsistency in keeping upon the statute book a law offering a bonus for the cultivation of timber and at the time keeping out foreign lumber by a duty." He thought it plethoric of wisdom, but it is rather a catch-penny notion, after all. Preserving the pine forests of Michigan, Wisconsin and Minnesota would not clothe the prairie states with the shelter of trees needed to make them more acceptable and delightsome as places of residence. Removing the duty on lumber would not justify the stoppage of forest culture. Michigan is not suffering from the destruction of her forests. If other states are, let them pay a bounty for tree planting, if it will pay. The duty on lumber is justified by the duties on iron, steel, woollen goods, sugar, tea, coffee, etc., and the general policy of protection, and it should stand or fall with them. Whether at some future time there will or will not be a dearth of pine in the United States cannot affect the question. The development of Michigan will not be stayed by any consideration of that kind. Billions of feet of the best timber that ever grew has been reduced to smoke and ashes in the progress of clearing Michigan and other States, and the operation will go forward until the utmost extent that can be reduced to cultivation has been reached. The pine and other woods of Michigan will not be preserved by rendering their conversion into merchantable shape unprofitable. When the axe of the lumberman can no longer be lifted up against them at a profit, the axe of the settler will fell them and the clearing fires sweep them away. Should the competition of the Canadian lumbermen become so sharp that as to induce the curtailing of operations in the Michigan lumber woods, there would be but little saving of timber for the future. Let some of the eloquent advocates of forest preservation go through the woods and view the havoc made by the fires of 1871, and they will be less urgent on the subject. The destruction of the Huron peninsula in 1882 is another illustration of what a fire in a forest can accomplish. The pine forests of Michigan are more and more subject to such visitations, and before such encroachments and the axes of the settlers they are sure to go down, whether lumbered or not. Indeed, if abandoned by the lumbermen they would the sooner disappear. The hardy settlers are among them engaged in pushing the wheat line northward. They will not cease their efforts on account of arguments advanced by the advocates of forest preservation, until Northern Michigan is covered with cultivated farms. If there is any argument in favor of protective duties upon anything whatever, it applies equally to lumber. Forest cultivation is another matter, in no way complicated with the duty on lumber.—*Lumberman's Gazette.*

TIMBER CONTRACTS ON WALPOLE.

The Wallaceburg *Valley Record* says :—"The Indians on Walpole Island are greatly excited over the sale of the balance of their standing timber. Mr. Tennant, of Malorytown, some time ago contracted for the white oak timber measuring less than 16 inches at the butt, and has removed nearly all, his time being almost up. In December he offered $7,000 for the larger timber, but as Mr. Hiram Little and others offered more, his offer was raised to $10,000. On Tuesday last the Indians were assembled to vote on this offer, Mr. Watson, of Sarnia, the Indian agent, being present. Meantime, however, Mr. Little increased his offer to $14,500 and a new dock and warehouse, and he further agreed to pay for the tops of the trees, when cut, at a rate which he claims would give the Indians a further sum of over $5,000 for work and timber. The offer of Mr. Tennant was that the small timber that he has not yet removed should be allowed to revert to the Indians, in addition to the $10,000 paid in cash, but it is claimed by Mr. Little and many of the Indians that the small timber referred to is worth less than $500, and if not removed at once by Mr. Tennant it will revert to the Indians. On the other hand it is claimed that no legal tender was made by Mr. Little, though 100 printed copies of his offer were circulated on the Island and placed in the hands of the Indian agent before the voting on Tuesday, on which day a majority of 14 voters approved of Mr. Tennant's offer, the vote being 67 for and 53 against. Mr. Little now claims that a large majority of the Indians were opposed to the bargain, but that they were bribed, and yesterday he secured the affidavits of about sixty Indians to prove this and is now adding very largely to the number. He has also engaged counsel and telegraphed for Indian Superintendent Dingman, of Strathroy, who will be here in a few days to investigate the matter. It is claimed by Mr. Tennant's agent that no bribery was practiced until Tuesday morning, and that then it was not resorted to until it was found necessary to checkmate the actions of their opponents. He further states that affidavits are already in the hands of Indian Agent Watson, proving bribery on the part of those opposed to the offer of Mr. Tennant being accepted by the Indians. Mr. Little's tender was never voted on, the Council on Tuesday being called to accept or reject the offer of Mr. Tennant. We give this week only a brief outline of the situation without comment, but as the matter in question is an important one it will receive attention in future issues of the *Record.*

FOREST DESTRUCTION IN THE STATES.

The *Mail* says :—The following article from the New York *Bulletin* calls the attention to some facts of very considerable interest to our cousins across the line ; and if it be the fact that the situation of lumber in Canada is not very much better than it is there, the article is of little loss interest to us than to them :—

In a recent article on the lumber industry of the United States in 1880, as reported by the Census Bureau, attention was called to the rapid destruction of American forests now in progress—so rapid indeed that it appears to be a question of but a few years when, at the present rate of cutting, the domestic supply of merchantable timber will be quite exhausted. We have now another bulletin from Mr. Sargent, the special agent in charge of the forestry section of the census, which sets forth in even a more striking light the extent of the slaughter of the small timber of the country for fuel.

The total value of the products of the lumber industry in 1880 was $233,367,720, more than half of which represented the destruction of white pine—a rate that it is calculated would practically use up the supply within eight years from the census year. The other portion of the total products represents, presumably, a less rate of cutting in proportion to supply, but yet sufficient to indicate a lease of life not much greater than in the case of white pine alone. And then, too, when the pine is gone the saws will be put into the other timber.

But the lumber industry by no means brings forward the whole, or even the larger part, of the forest destruction that is going on. The total value of cordwood consumed in the United States for fuel in 1880 amounted to $312,962,373, and that to at an average valuation of less than $2.25 per cord. Taking this into consideration, and the fact that cordwood is a lower grade of wood than lumber, it will be readily appreciated that the total value of the consumption for fuel represents a much greater destruction of trees than does the lumber industry ; certainly twice, perhaps three times as much.

The map accompanying the bulletin indicates a very small area of the country in which the use of coal for fuel predominates. The area is not a continuous one, but is represented by spots, some of a considerable size, contiguous to the large cities lying about the 41st parallel of latitude and extending all the way from Massachusetts to Nebraska. These areas are separated into two groups, eastern and western, by the intervening wood consuming region of Indiana and Western Ohio. Following this line and enclosing these areas is a wider belt in which wood only is used for fuel to any extent. Grouping the returns by states into sections, we have the distribution of fire wood consumption in 1880 as follows :—

	Cords.	*Value.*
New England	3,780,878	$ 14,934,629
Middle States	20,625,790	57,376,183
Southern States	67,296,340	112,188,505
Western States	43,352,207	96,837,368
Far Western and Pacific States	5,482,224	25,513,055
Total domestic use	140,537,439	$306,950,040
Total, other consumption.	5,240,698	15,012,333
Total consumption	145,778,137	$321,962,373

This total is further increased by an item of $5,276,736 for wood put into charcoal. No estimate is given of the amount of standing fire wood, and it is, therefore, not possible to say at what rate the consumption is encroaching upon the supply and annual growth. But everyone knows that in most of the Eastern and Middle States this source of fuel has been practically exhausted ; far enough, at any rate, to make wood dearer than coal. The area of complete destruction constantly widens with the area of dense population. It is evident, therefore, that in the course of another generation or two the forests of the whole country will be in the condition they are now in at the East. It is beginning to be considered certain that these changes are having a material effect upon our climate and upon our crops.

It is this phase of forest destruction that appeals to the thoughtful agriculturalist in behalf of tree culture. For the purposes of fuel and many minor uses, it is quite practical to plant trees and get satisfactory profits in comparatively few years. Many kinds of trees grow rapidly. Even some of the hardwoods do—as walnut, cherry, &c. The long-leafed pine is a very rapid grower. The late Governor Ross, of Delaware, one of the most prominent and successful agriculturalists of that State, seeded a portion of his fair acres in long-leafed pine when in middle life. It was not done broadcast, but in rows some thirty feet apart. The result was a source of continuous pride and satisfaction to himself and to the community. He lived to see a beautiful little forest of stately pines. Trees planted in this way admit of other crops between the rows for many seasons, and wood can be taken in a few years by thinning out in the rows as the growth requires. And it need hardly be added that the study of trees, and their adaptation to climate, soils, &c., is in itself a pleasant and wholesome recreation.

POLISHING WOODS.

A correspondent of the *Scientific American* asks : 1. For the best way to polish fancy woods ? A. Soft woods may be turned so smooth as to require no other polishing than that produced by holding it against a few fine turnings or shavings of the same wood while revolving. Mahogany, walnut, and some other woods may be polished by the use of a mixture as follows : Dissolve by heat so much beeswax in spirits of turpentine that the mixture, when cold, shall be about the thickness of honey. This may be applied to furniture or to work running in the lathe by means of a piece of clean cloth, and as much as possible should be rubbed off by using a clean flannel or other cloth. Hard woods may be readily turned very smooth ; fine glass paper will suffice to give them a very perfect surface ; a little linseed oil may then be rubbed on, and a portion of the turnings of the wood to be polished may then be held against the article, while it turns rapidly around, which will in general give it a fine gloss. You may also try alcoholic shellac varnish, 2 parts ; boiled linseed oil, 1 part : shake well before using. Apply a small quantity with a cloth, and rub vigorously until the polish is secured. 2. To make paper-hanger's paste ? A. First heat water to boiling, then add flour with constant stirring. To prevent the formation of lumps the flour may be passed through a sieve, so as to insure its most equable distribution ; agitation is continued until the heat has rendered the mass of the desired consistency, and, after a few moments further boiling, it is ready for use. In order to increase its strength, powdered resin in the proportion of one-sixth to one-fourth of the weight of the flour is added. To prevent its souring, oil of cloves, or few drops of carbolic acid is added.

A STRANGE COMMUNICATION

We have received in an envelope bearing the postmark "Dublin," and the name of the Shelbourne Hotel, Dublin, surmounted by a Viscount's coronet, the following production, It is satisfactory to learn that we are safe on this side of the Atlantic, and that we owe this additional benefit to our great agricultural and lumbering industries :—

THE END OF THE WORLD.

TO THE INHABITANTS OF PLANET EARTH.

When Fires refuse to burn
Our God doth then appear,
Continents He will turn
Into a Hell this year.

The winds will cease to blow,
There will be Drouth and Heat ;
Corn for Food will not grow,
Nor will Oats, Pease, or Wheat.

British Isles 'scape alone
An Angry Iron Rod,
On them descend the throne
Of King Jehovah-God.

Sinners who will repent
Can now obtain the keys,
Which save from punishment,
Found only on their knees.

For the purpose of obtaining a large supply of Grain, Timber, and Lumber for the British Islands, Canada and the United States will be exempted from calamities this year. J. G. SWORD.

City of Dublin, Ireland.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

Office Orders
Office Receipts
Office Blank Books
Office Ship Account Books

And everything necessary to a complete office outfit.

All PRINTING done in the Highest Style of the Art, and at Lowest Living Prices.

BOOK-BINDING of every Description got up in a very Neat and Superior manner.

Account Books Ruled and Bound to any desired Pattern.

For Schedule of Prices address, describing the kind and quality of work desired,

TOKER & Co.,

"THE CANADA LUMBERMAN,"

PETERBOROUGH, ONTARIO.

EMERY WHEELS FOR SAW GUMMING.

EX INUTILI UTILITAS
TRADE TANITE MARK

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

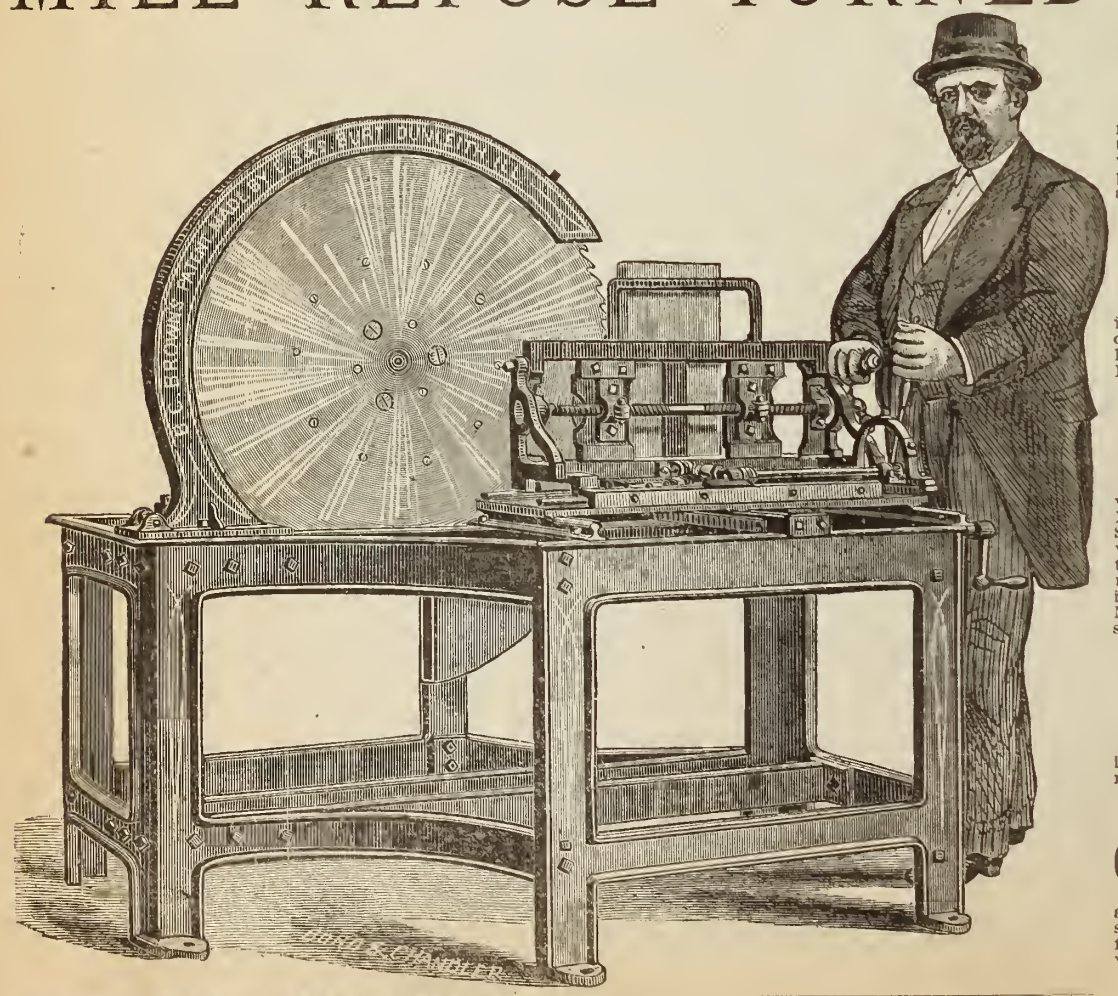
MILL REFUSE TURNED INTO MONEY



BY THE USE OF

Brown's Patent Spalt and Shingle Mill,

for making Shingles, Barrel Heading, Box Stuff, &c., from spalts, board trimmings, slabs, and mill waste generally, turning material otherwise worthless into valuable products. I have made arrangements with the patentee to manufacture and sell for the Dominion; have made and sold a good number of these machines which are giving excellent satisfaction and can give the best of references.

Our Steam Feed for Circular Mills,

is now the Best Feed where Steam is the motive power. It is easily operated, is simple, rapid, and seems never likely to wear out; sixteen 16 ft. boards, or eighteen 12 ft. boards, have been cut by it in one minute. It is the established feed for steam mills; I make a specialty of its manufacture; will guarantee satisfaction.

Our Patent Twin or Span Circular,

with Steam Feed for Steam Mills, and Rope or Rack Feed for Water Mills is fast coming into general estimation and is used in place of Gang Slabber in our best Canadian Mills. One of our Span Circulars which will slab logs 25 inches in diameter down to 7 and 8 inch stocks, will do the work of three slabbers, with an immense reduction in first cost, running expenses and labour. Two of these machines can be seen at work in Messrs. Gilmour & Co's Mill, Trenton, and Georgian Bay Lumber Co's Mill, Waubaushene and Port Severn. ☞ I am also introducing a new style of Mill Engine, neat, substantial and simple, with Corliss Frame and Balanced Valve, all carefully designed and honestly made.

Covel's Automatic Saw Sharpener,

is now well-known and highly appreciated, when placed at work in the mill it sings out its own praise; I keep it constantly on hand, ready for immediate shipment.

Our Standard Circular & Gang Mills & Machinery,

are too well known to need any reference, any further than to say that I spare no pains or expense to have my work all first-class and give satisfaction, and as I make Heavy Saw Mill Machinery a specialty, any party wanting a First-class Mill will find it to their advantage to give me a call

FOREST GROWTH ON COAL FORMATION OF NEW BRUNSWICK.

(BY EDWARD JACK.)

Dr. Bell in the report of the progress of the geological survey of Canada, for 1879-80, states that hemlock "is scarce near the eastern sea coast of New Brunswick." The doctor is mistaken; some of the very best hemlock lands in New Brunswick are to be found on the east side of the Intercolonial, between Newcastle station and the crossing at the Richibucto river, indeed, so far from being scarce, hemlock is very abundant on both sides of this railway in the location above mentioned.

The eastern sea coast of New Brunswick is largely embraced within the bounds of the carboniferous rocks, and where these occur in that Province hemlock is usually in great abundance; where it is usually of large size with rough and coarse bark, the wood being commonly shaky and of infirm quality; on the immediate sea coast hemlock is not usually found, the growth there being most always white birch and poplar or stunted spruce. The rocks of the coal formation underlie about a third part of New Brunswick; the country where they occur is usually level, ridges where they occur being generally low and of gradual elevation. On the heads of the streams there are extensive heaths and bogs, some of these have evidently been at one time lakes over which vegetation has spread and which has acquired such consistency as to allow persons to walk over it. This is especially noticeable on the head of the Canaan river where there are ponds of great depth in the middle of the barrens, the water in these being bright and pure. The original growth upon the coal formation consisted largely of spruce, pine, hemlock and Tamarac, hardwoods being less abundant and of inferior quality. As the carboniferous formation was largely in the track of the Saxby gale, the timber which once stood upon it has been for the greater part blown down and burnt, but a young growth, especially of white pine, is springing up in many places, which if protected will be of very great value.

Large quantities of second growth white birch are also making their appearance, and, as this is a wood of quick growth, it will not be many years before it will be of value. Very much of the soil on the coal measures is nearly worthless for agricutural purposes, but very well adapted to the growth of the white and red pine. The streams by which the carboniferous area are intersected are free from stone and easily driven, in many cases logs could be rafted immediately to the sea from the place where they have been cut, so that we have here just the country for the purpose of experimenting in forest cultivation. About the only thing to dread is fire, to which the plains of this district are much subject. Not only could pine and birch be grown to advantage, but also tamarack, which is a wood of rapid growth springing up around swamps and places where the ground is low and damp.

PROTECTION WHICH DOESN'T PROTECT.

WILLIAMSTOWN, January 27, 1883.—The following letter has been published:—Our revenue for the present fiscal year is estimated at $400,000,000, a sum altogether beyond onr needs in a time of peace, an unreasonable burden upon the people, and a temptation to extravagance and recklessness in expenditure on the part of the government. The people are asking for a diminution of this excessive revenue by the lessening or the removal of some of the taxes imposed upon them directly or indirectly, and by means of which the revenue is secured. And now that Congress is considering how to re-adjust the burdens of taxation, what duties or taxes may be lessened or remitted altogether, we venture to suggest that one important article which should go upon the free list is lumber. If there is one thing in which all are interested, from the boy who wants a stick suitable for the exercise of his propensity to whittle to the man who wishes to build a house or a factory, it is lumber, and especially that which is the product of our white pine trees, the noblest trees of the forest. So valuable is this lumber, because it is adapted to so many uses, and so great is the consequent demand for it that the domestic sources of supply are being rapidly exhausted. Formerly we derived large quantities of pine lumber from Maine, from the banks of the Kennebeck and Penobscot. Now our chief source of supply is the region comprising the states of Michigan, Wisconsin and Minnesota. And so rapidly are we stripping this region that it is estimated in the returns of the recent census, that the supply from this source will be exhausted in less than ten years. As a consequence the price of pine timber land and of lumber is rapidly advancing, enriching a few land-holders and lumber dealers at the expense of the public at large. Meantime Canada stretches along our northern border a broad belt of pine timber which she is ready to send to our markets, but which we seek to exclude by imposing upon its introduction a duty of two dollars for every thousand feet. The protection which this duty affords to our forests is, to use the words of another applied to a different subject, "such protection as wolves give to lambs, covering and devouring them." The duty amounts to a premium offered for the destruction of our forests. Our lumbermen are stimulated by the additional price of two dollars a thousand feet, which this duty enables them to charge, to cut off our forests as rapidly as possible and hurry them to market, and the people of Canada instead of cutting their lumber and giving us the benefit of it, are coming over the borders as an army with axes to hasten the destruction of our forests. It was recently stated before the committee on the revision of the tariff that as many as ten thousand Canadian wood-choppers come into the Michigan pineries in the winter and find ready employment in cutting lumber, at wages raging from two dollars to two dollars and a half per day. Thus our precious pine forests are not only exterminated the more rapidly and the cost of lumber to all of us enhanced, but we are putting into the pockets of our Canadian neighbors $25,000 a day for the aid which they give us in destroying one of our most valuable possessions. For it is to be remembered that every pine into which the lumberman strikes his axe represents the growth of a century, and that those pine forests of Michigan and Minnesota are not to be reproduced in a hundred years if at all. It will be a great loss when those northwestern pineries are no more. We have other forests indeed. We have other pine forests; but none of the quality of these. It is very desirable to prolong their existence as much a possible, and if, in any reasonable and practicable way we can lessen the demand upon them so that instead of being swept utterly away a remnant may be spared, and so treated that successive growths may be secured upon the same ground, nothing more advantageous for the country in all respects could be wished for.

May we not well, therefore, relinquish all duties upon pine lumber, and welcome freely all that Canada or any other country is ready to give? We need to protect our precious forests. The lumbermen will protect themselves. They have done so already. A prominent organ of theirs, published in the northwest, proclaims that the ownership of a pine forest and a saw mill is better than that of a mine of gold or silver. The mass of the people want cheap lumber and the interests of the few lumbermen ought not to prevent their having it.

N. H. EGGLESTON.

PINE STILL GROWING.

The *Huron County News*, of Michigan, said in a recent issue:—

It is a matter of surprise to see how large a number of saw logs continue to be taken from tracts of land supposed to be thoroughly lumbered years ago, as well as from the windfalls over which the fires have swept. From such sources the custom mills—of which every township has one or more—are again this winter being fully stocked, some having already all they can saw during the coming season.

Such a state of things is by no means new. Many tracts of pine lands are denuded time and time again. A few years ago a firm of extensive operators on the upper Mississippi gave out that all the pine was cut on lands which they owned on a tributary, and their forces were sent elsewhere. Two or three years ago, however, the same operators established their camps on this same denuded land again, and went right on logging, as if nothing had ever happened. Incidentally, it may be mentioned that one of the members of this firm helped to make the census figures which so innocently assure the people that there are but 6,000,000,000 feet of standing pine in the state of Minnesota. Possibly there are people of an inquiring turn of mind who will ask, if this man knew so little about the pine standing on his own land, how did it come about that he knew enough about the pine all over the state to be considered an authority? but, of course, the census figure-makers would at once raise the point that the question is irrelevant.—*Northwestern Lumberman.*

SOLID PIANO CASES.

The piano manufacturers of this city are discarding, in a great degree, rosewood veneered cases, and making ebonized cherry cases instead. The name of rosewood, when pronounced, is a very pleasing wood to some, but that does not prevent the wood, when laid on a piano case from splitting and blistering, which it almost invariably does, sooner or later. A rosewood case, a few years old, that looks decently, is difficult to find. The manufacturer is often cursed for it, but he is not to blame. It is the nature of the wood. A Chicago manufacturer had a large number lot of cherry sawed by Muskegon, Mich., parties, and will use it in many of the instruments turned out by him. There is no reason why a sold cherry case should not hold its good appearance until the piano is worn out. A certain class of purchasers—and much the larger class—have some regard for durability as well as style, and these are learning to let a rosewood veneered piano alone. Should the use of cherry become very general in this industry, it will open up a demand for it that has not heretofore existed.—*Northwestern Lumberman.*

MIDLAND.

The *Free Press* says:—While taking a stroll around our little village, I observed a structure being placed on the mill deck at Dollar's mill. On enquiry from our Mr. Fraser what it meant he gave me the very pleasant information that Mr. G. A. Greer, a Moutreal lumber merchant, has purchased the entire stock, (with the exception of the mill culls, which were sold previously to Mr. Kennedy, of Toronto,) with the intention of shipping it to the Northwest in the spring. Mr. Priest, Mr. Greer's agent, is placing three planing mills on the mill deck, and a rip-saw to be driven by the engiue belonging to the mill, to prepare the lumber for immediate use when it reaches its destination. We wish Mr. Priest success in his uudertaking. It is a new thing iu these parts and it is already doing good, as many of our noble lumbermen will get employment instead of walking around with faces on them as if they were going to their father's funeral.

MANITOBA LUMBERING.

The Emerson *International* of Feb. 17, says: R. J. Short, Esq., a prominent and well-known tie and timber contractor, was an agreeable caller at the *International* office to-day, and during his call, gave a reporter information in regard to his lumbering operations on the Lake of the Woods that may not be without interest to the general public.

Mr. Short has a contract for getting out 15,000,000 feet of logs and 150,000 railway ties, the latter for the C. P. R. Co. He gets his supply of timber from his timber limits on the Lake of Woods, and has eight camps. He employs 215 men and about 50 teams. Wages are as follows: choppers, $30 per month and board; hewers, $50 per month and board; teams and teamsters, $2.75 per day and found. Mr. Short was too modest of course to say anything about the excellent board he provides his men, but we know from expressions of Emersonians who have worked in his camps that he provides first-class fare for his men. The rations include fresh fish, fresh and salt beef, fresh and salt pork, tea and coffee, fresh bread, etc. Mr. Short states that that he has about thirty-five men from Emerson at work in his camps, and quite a number of teams from this point. The object of his visit to Emerson this time was to purchase and hire a number of teams. He purchased two fine teams from Mr. Wm. Coutts, and will engage a sufficient number of horses to make up a carload. Mr. Short furnishes free transportation for men and teams to the camps. He has already shipped three carloads of horses from this point.

Mr. Short states that the eastern portion of Manitoba, or the "disputed territory" is far more valuable for its minerals and its timber than most people imagine. As an instance of the supply, Mr. Short relates that from eight acres his men cut 9,100 logs and 27,000 ties. The pine is of the red and white variety. The trees are straight, and frequently 114 feet high, while some four feet in diameter have been cut.

Mr. Short is erecting a large saw mill at Rat Portage, which promises to become the Minneapolis of the Canadian Northwest. He also has very ingenuous machinery at Rat Portage, operated by steam, to facilitate the loading of ties on flat cars for shipment. Those members of the Press Excursion party that visited the Lake of the Woods last summer will remember with what interest the party watched the working of the contrivance which loads a car in incredibly short time.

THE U. S. TARIFF.

In the debate in Congress on the Lumber Tariff, Mr. Horr of Michigan, said: "Last year the State of Michigan alone manufactured 3,850,000,000 feet of pine lumber. The product of the forests in Michigan last year, including laths, shingles, staves, etc., amounted to the enormous sum of $60,000,000. The lumber product of the United States as a whole was worth the sum of $230,000,000. The value of the mills and lumber plants in Michigan alone is over $40,000,000; in the entire United States $180,000,000. The mills in Michigan employ 21,000 men at an average of $2 per day, and the camps employ 35,000 men at an average of $1.75 per day. It will thus be seen that in Michigan there is being paid out to laborers in this industry, over $100,000 per day. Last year Michigan paid on its lumber industries $17,500,000 for labour alone. The United States paid over $80,000,000. There were at work in the United States in the lumber mills 90,000 men, and in the lumber camps 130,000 men. The lumber interests of the United States last year bought and consumed $30,000,000 worth of products of the farm for food for man and beast. Last year Michigan, Minnesota and Wisconsin produced 7,500,000,000 feet of lumber. In the northwest were produced last year over 4,000,000,000 shingles. There is left in the United States to-day a large amount of standing pine. On the lower peninsula of Michigan there are 7,000,000,000 feet. There are of standing pine in Michigan, Minnesota and Wisconsin 81,000,000,000 feet; in the Southern States the enormous amount of 230,000,000,000 feet; in Canada there are only about 75,000,000,000 feet of standing pine. That imported each year into this country is less than 400,000,000 feet, the revenue from which amounts to about $1,000,000." Mr. Horr said he had given these facts to show the enormous magnitude of this interest. "The question now is why should there be a duty upon this article. The commission recommended keeping the duty on lumber where it is. The stumpage on lumber in Michigan averages about $4 per thousand. The bulk of lands in Michigan and Wisconsin were granted by the government to different corporations. In Michigan large grants were given to the canal company and four or five railroads running through the pineries. Very little, if any, of the pine of Michigan now left in the hands of mill men was purchased at Government price. The lands from which the manufacturers get their supplies have to be bought at advance rates. The taxes in Michigan are ten times as large as they are in Canada. Wages are 30 per cent higher. The price of articles is higher in the United States than in Canada. All farm products are higher, horses are higher."

In regard to the question of preserving the forests in Michigan, Mr. Horr said they were compelled to lumber their lands or lose them altogether. "All through that state settlers are building up farms. Railroads have been run in every direction. This causes large fires. When the timber is burned it has to be lumbered within one year or it becomes worthless. A worm or grub attacks the tree as soon as it commences to die. The question is not so much how to preserve the forests as how to preserve the timber when the forests are burned. With the tariff on lumber which protects against the coarse lumber of Canada, they can lumber their lands much more closely than when lumber is low. It was stated that lumber was high, but, asked Mr. Horr, "is it true that a country is most prosperous when the prices of everything is low?" He held the contrary to be true. Mr. Horr said it had been his aim to stand by from the start all the industries of the country. He had tried to rise above the mere local advantages. They had been living twenty-two years under the present tariff system and no other nation could show such general advancement. No class of men were more prosperous than the tillers of the soil. They find a ready market and a good price for all they can raise, and they fully understand that this state of things exists on account of the enormous industries that have grown up and become prosperous under the present tariff system.

DISTRICT OF NIPISSING.

TOWNSHIP OF FIELD.

The following is taken from the official report:

ST. MARY'S, ONTARIO.
December 31st, 1881.

SIR,—I have the honor to inform you that I have completed the survey of the township of Field, under instructions from your department, dated May 18th, 1881; and have to report thereon as follows:

Leaving Toronto on the 15th of June, I proceeded to the township, via Rosseau and Nipissing, crossing Lake Nipissing by the steamer Inter-ocean to Sturgeon Falls. I then proceeded by canoes up Sturgeon River to the northeast angle of the township of Springer, and having obtained on the 21st of June an observation of Polaris on east elongation commenced my survey by running the east boundary of Field on a course astronomically north, making the concessions one mile in depth, from one to six; the lots were laid out forty chains in width along the south boundary by retracing the northern boundary of the township of Springer from one to fourteen inclusive, and I found only twenty-seven chains, twenty-five links left for lot fifteen to the northwest angle of Springer, instead of thirty-seven chains as shown on sketch furnished me. From the post at the northwest angle of the township of Springer, the west boundary was drawn on a course north astronomically as per instructions. In carrying out the survey I ran the line between concession two and three from the east to the west boundary, on a course west astronomically making the lots forty chains in width to lot fifteen returning to side line between lots ten and eleven. I ran north astronomically to the north boundary. The western portion of the survey was then completed in the manner set forth in instructions, and finally I worked east completing the work at the northest corner of the township.

The latitude of south boundary I assumed as north 46° 27' 16". The variation of the needle was found to be west 6° 15'. Astronomical observations were taken frequently during the progress of the work, the details of which will be found among returns of survey.

I have to report about one-third of this township fit for settlement. The valley of the Sturgeon River, which traverses this township from southeast to northwest, is clay soil with an occasional vein of sand, which when cleared will make excellent farming land; while a fair portion of township may be described as sandy loam, the best land is along the Sturgeon River and northern or central portion of the township, the other portion being rocky and generally unfit for settlement.

Considerable white pine is scattered over the whole of the township, the southwest quarter is a very valuable limit of timber, the pine being of large growth and good quality, some very good pine was also found in the northwest quarter of the township, and the township generally is covered with a thick growth of white birch, balsam, spruce, cedar, tamarack, etc., here and there a few maples, some very good groves of cedar suitable for telegraph poles, and tamarack timber suitable for railway ties being met with.

As before stated the Sturgeon River traverses this township from northwest to southeast, eventually falling into Lake Nipissing. It is a stream about three chains in width and fifteen feet in depth, very suitable for driving purposes. The Tomiko River is the principal stream coming in from the northeast, and various creeks from other portions of the township—some of them being outlets of lakes—find their way into the Sturgeon River; a few lakes, as shown on my plan of the township, were met with.

The general character of the township is undulating, but not broken, here and there a cliff, but no very high hills are met with. The formation is granite and is but scantily covered with soil in many places, especially in the southwest, northwest, and northeast portions. I did not observe any traces of valuable minerals, and saw no rock but ordinary granite.

Access to this township is at present by Lake Nipissing and the Sturgeon River, but the Canadian Pacific Railway will doubtless afford the means of settlement at an early day.

There being no squatters in the township no Inspection Returns are necessary.

I have the honor to be, Sir,
Your obedient servant,
(Signed) H. R. McEVOY,
Provincial Land Surveyor.

RIGA GOODS.

The London *Timber Trades Journal* says that a correspondent favors it with the following extract from a letter from Riga:—"The manufacture of wood goods at Riga will during the coming season be conducted on a considerably reduced scale. In the first instance it will be remembered that last winter was highly unsuitable for the felling or transporting of timber, in consequence of which circumstance a much smaller quantity of logs reached Riga than usually is the case, which again influenced the price to a degree preventing the millowners from buying anything like their usual stocks.

"But the great check to production will come from the Fire Insurance Companies, throwing as they do serious difficulties in the way for the renewal of expired policies of sawn goods.

"It is hardly surprising that the companies should try to resort to extraordinary measures in view of the numerous and highly disastrous fires in timber yards, mills, &c., during the last years in Russia and Finland; but we find this stipulation quite prohibitory to trade, viz.:—"that the insured is to take a quarter of the risk himself." The rate of insurance has recently been raised to 3 per cent. on these kinds of goods, and the stockholder has thus actually to pay 4 per cent. on the insured amount, of which 25 per cent. is not recoverable in case of accident.

"It is rumoured that a firm of large mill-owners and shippers will give up the timber trade entirely, in order to engage in another branch of business on account of the above mentioned difficulty to insure their goods. Partly for the same reason, and partly from want of logs, two other saw-mills have stopped work, and one mill burnt last year has not been rebuilt. The above three mills turned out and shipped more than 30,000 standards. Thus this quantity will at least be less exported than last year, not counting that the rest of the mills will also have to restrict their production for reasons mentioned above."

Old Timbers.

The posts of a railing recently put up in the new office of the Sycamore Powder Company, on Market street, Nashville, are carved out of white oak timber cut about forty-five years ago, at Sycamore Mills, in Cheatham County, Tenn. The timber out of which these posts were made was used by the late Judge Samuel Watson in the construction of a mill-race, and lay immersed in the water over forty-two years, when they were taken out, and after being seasoned, Maj. Eugene Lewis, manager of the Powder Company, had them fashioned into their present shape. The wood is as sound as it was the day it was cut, and has become almost as hard as iron, and turned a very dark, almost black color.—*Southern Lumbermen.*

THE *Lumberman's Gazette* of Bay City, Michigan, says:—That the immense snowfall and other peculiarities of the weather have greatly interfered with logging operations all over the country, is undoubtedly true, and that a great shortage in the anticipated cut will result is also undoubtedly true. It may be said that the elements, by their late unpleasantness have been playing into the hands of the lumbermen, in interfering with the enormous output of logs which had been anticipated. In fact it may be stated with a great deal of truth, that the elements have conspired to prevent the average lumberman from committing business suicide.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on Jan. 30th, 1882 and 1883, and also the Consumption for the month of Jan., 1881 and 1882:—

	Stock, Jan. 30th. 1882.	*Stock, Jan. 30th. 1883.*	*Consumption for the month of Jan 1882.*	*Consumption for the month of Jan 1883*
Quebec Square Pine	284,000 ft.	258,000 ft.	99,000 ft.	64,000 ft.
" Waney Board	318,000 "	245,000 "

" Boards Flooring	1,756 "	3,395 "	137 "	344 "

AUSTRALIAN TRADE.

Messrs. Gemmell, Tuckett & Co.'s last report, dated Melburne, December 20th, says:—Notwithstanding the advanced rates for money now ruling, operations in the building trade continue as brisk as ever, and although the consumption of timber continues on the same large scale as reported by us in all of our issues during the present year, stocks are steadily accumulating, and in view of the large quantities yet to arrive we do not anticipate that present rates will be maintained, unless great caution is exercised by importers in handling their stocks. American lumber.—This line has fully sustained our ideas of an advance on last month's rates, and we believe that higher prices will be obtained at the next offerings at auction, as the trade holds stocks sufficient for requirements. We report sales ex Penobscot, Childers, Loining, and Abbie Carver. Prices realized were :—For w. p. shelving (inferior), 12 in., £9 2s. 6d. ; 14 to 15 in., £8 15s. : Michigan clear pine, 1½ in. to 4 in., £18 2s. 6d. ; 1½ in. to 2 in. Canada do., £18 to £17 17s. 6d. ; 1 in. dressed clear, 12 in. to 14 in., £16 7s. 6d. to £16 2s. 6d. ; 12 in. to 14 in. shelving, £11 5s. to £9 5s., according to quality ; Michigan clear pine, 1½ in. to 8 in., £18 10s. to £17 5s. ; dressed clear, 12×1, £16 2s. 6d. ; 12 in. ordinary shelving, £11 per 100 ft. super.

THE ENGLISH WOOD MARKET.

We take the following from Messrs. Robert Coltart & Co's. annual wood circular, dated Liverpool, January 31st, 1883 :—

Quebec Yellow Pine.—The import during the past season has exceeded that of 1881 by 24 per cent. In the early part of the year the stock of both square and waney pine was unprecedently light, and prices ruled extremely high. The arrivals during the year met with ready sale at full prices until towards the close of the season, when they became rather easier, but as the stock now held is comparatively small, consisting of only 503,000 feet, full prices are again demanded. It is gratifying to find that the trade have been able to import this wood profitably at the present high prices, in the face of the large stocks of, and low prices for pitch pine. The total consumption during the year has consisted of 1,950,000 feet, against 2,013,000 feet in 1881. The sales have been, of waney board pine, of prime quality, 15 inches average at 2s 1d per foot, 18¾ inch average at 2s 7d per foot, 19¾ inch average at 2s 7d per foot ; of prime square pine, 18 inch average at 2s 6½d per foot, and deck plank wood at 2s 6d per foot ; good fair average square, 15 inch average at 2s. 2½d. per foot, and 12½ to 14 inch average at 2s. 1d. to 2s. 2d. per foot. The import of St. John pine has consisted of 2,081 logs against 1,690 logs last year. Of Miramichi pine, sales have been made, of 13 to 14 inch average, at 20d. per foot, and of Newfoundland pine, 14 to 14½ inch average at 23d. per foot.

Red Pine.—More business has been done in this article than for several years past, the import having consisted of 135,000 feet against 51,000 feet in 1881, and the present stock consists of 58,000 feet. The sales have been—of 27 feet average at 14½d. per foot, 35 feet average at 16½d. per foot, and 50 feet average at 20d. to 20½d. per foot.

Quebec Oak.—The import has slightly exceeded that of last year, but there has been a fair consumption, and the stock on hand is very moderate. With inferior wood the market has been amply supplied and sales have been difficult to make, but the supply of prime wood has been limited, and prices have shown little variation, the sales having been—of 53 feet average at 2s. 10d. per foot, of 65 feet average at 3s. per foot, 55 to 64 feet average at 3s. to 3s. 1d. per foot, and 68 feet average at 3s. 2d. per foot.

Elm.—There has been a fair enquiry for this article at steady prices, and the consumption has exceeded the import, which consisted of 125,000 feet. Prices have shown little change, the sales having been—of 50 feet average at 23d. per foot, 54 feet average at 2s. to 2s. 1d. per foot, 45 feet average at 2s. 0½d. per foot, and 45 to 50 feet average at 2s. per foot.

Birch.—The arrivals have been light during the year, and as the consumption has been on a fair scale, sales have been readily made at good prices. The present stock is light, consisting of 72,000 feet, against 106,000 feet at the same time last year. The sales have been—of St. John, 14/8 inch average, at an average of 20½d. per foot, 15 inch average at 17⅛d. to 18½d. per foot, and 15½ inch average at 20½d. per foot. Parcels of Lower Port wood have realized 16½d. per foot for 15 inch average from Halifax, 16½d. per foot for 14 inch average from Miramichi and Dalhousie, and 13d. to 14d. per foot for Prince Edward's Island wood.

Quebec Pine Deals.—The import during the past year has amounted to 21,116 standards, against 18,930 standards during 1881. During the first few months the demand was dull and prices declined, and the early shipments being pressed forward by steamers at low freights, there was a further fall in values to a point below the cost of import, which, however, was recovered before the end of the season. The present stock amounts to 5,822 standards, being about equal to that held at the same time last year. Prices opened at from £20 to £22 10s. per standard for 1st quality, £14 to £15 per standard for 2nd quality, £9 10s. to £10 per standard for 3rd quality, from which, about June, they declined about 15s. per standard, but have since recovered to about the opening prices.

A SHORT CUT.

There is a strong probability that the cut on some of the streams will fall short of what was intended to be put in, and it is rather paradoxical that the majority of the operators are rejoicing over such a prospect. Before they put their forces in the woods they knew there was a large stock of lumber at nearly every point, and that a heavy production this season would have a decided tendency to push prices downward ; nevertheless they prepared to cut more logs than were ever cut before in one season. A few concerns, understanding that conservatism would be a jewel, pulled in their sails in part, but the others went right ahead, declaring at the same time that there would likely be an overstock, and that the only legitimate outcome would be cheaper lumber. Now that Providence has stretched out a hand to help them, albeit they would not help themselves, they grasp the hand with all the fervor of an old friend, and declare that things do sometimes come right in spite of them. One of the largest operators recently visited the *Lumberman* and stroked his beard with satisfaction at the outlook, and expressed a belief that 75 per cent. of the intended cut would put as much money into the manufacturers' pockets as the entire anticipated cut would—and without much doubt he reasoned well. The *Lumberman* has held for some time that it would be wise on the part of the saw mill men of the Northwest to regulate the supply by the demand—to avoid putting two boards on the market when the demand called for but one—and it is rather pleased to know that so many have accepted its teachings as correct, notwithstanding they have not cultivated sufficient nerve as yet to live up to them. The prosperity of the lumber industry depends largely upon steady prices, and the *Lumberman* has no sympathy with the man who would push the prices of lumber ruinously low, providing they could, and none with those who would force prices to such heights that the demand, in part, would be choked off.—*Northwestern Lumberman.*

U. S. LUMBER TARIFF.

The New Orleans *American Lumberman* contains the following communication under the heading "Unjust Discrimination :"

Alexandria, La., Feb. 12, 1883.

I notice with much surprise and regret the action of the Senate of the United States in passing a bill to take off the duties on Canadian lumber. This is an injustice to a large industry, and to many men, now being supported by it, for the following reasons :

1. There is about three hundred million dollars, and one million men engaged in the business, and a reduction if made at all should be gradual, say 50 cents per m. at a time—and not violent—such as taking the whole $2.00 off at once.

1. Careful estimates by practical lumbermen show that the forestry bulletins of the Government are unreliable, as there is a much larger quantity of white pine in the Northern States than the Government agents report.

3. There cannot possibly be any scarcity of lumber for a century after the Northern States have been depleted of their standing pine, for the reason that there are larger tracts of yellow piue in the Southern States.

4. This can be all used where white pine is now used, by using *thinner* boards for boxing, building, and most other purposes, by which the difference in *weight*, as relating to transportation will be overcome, as a yellow pine board five-eighths of an inch thick—timber—in proportion. and the duty on lumber should be retained so that our Southern States may have the benefit of northern capital to develop this vast industry, which I am afraid will not be done for years if Canadian lumber is admitted free of duty.

5. Everything to produce lumber in Canada is at least 25 per cent. cheaper than in any part of the United States.

6. The average price of lumber to the consumer is about $20 per thousand feet, and the present duty of $2 is only 10 per cent. of its selling value in the States, and as probably nine-tenths of the people who use lumber are people above the laboring classes, the duty is not in any sense a burden upon the community.

7. Consider the difference it will make to the States having these large tracts of yellow pine—Mississippi, Georgia, Florida, Louisiana, Arkansas, Missouri, and North and South Carolina—whether they are developed, or left comparatively untouched, as they certainly will be *for years*, if Canadian lumber comes in free of duty.

I would like to see some action taken by your lumber exchange, and if possible a meeting called, and the subject ventilated, and memorials circulated and sent to to our representatives, protesting against having an injury done to our infant industries. Yours,

Long Leaf Pine.

Messrs. Whitesides, of Champlain, N. Y., have purchased seven hundred cords of wood from Mr. Bachand, of Roxham, Que., at $1.50 per cord and are drawing it to their paper mills.

A new industry in the Southern States is the making of pressed wooden plates. A factory in Newbern, N. C. is turning out 100,000 per day, and there are two other factories, one at Frankford, Delaware, the other at Sunderland, Vt., for making the same articles.

The Parry Sound *North Star* says :—The Maganettawan Driving and Boom Company, has been granted Letters Patent by the Lieutenant Governor in Council. The members of the Company are : Hon. W. E. Dodge, Arthur M. Dodge, and H. Dodge, of New York, U. S. ; Jesse S. Peckham, Waubaushene, Ont. ; Henry L. Lovering, of Coldwater ; James Scott, of Waubaushene, and James H. Buck, Byng Inlet. The object of the Company is to operate the rivers tributary to the mills of the Maganettawan Lumber Company at Byng Inlet, in this district.

Lumber Drivers' Calks

For Use in Stream Driving to insure a safe footing in Slippery Places.

25 in ball and 5 in heel are the numbers usually required.

(This Engraving represents the Lungs in a healthy state.)

THE WAY IT WILL AFFECT YOU.

It excites expectoration and causes the lungs to throw off the phlegm or mucous; *changes the secretions and purifies the blood;* heals the irritated parts ; gives strength to the digestive organs ; brings the liver to its proper action, and imparts strength to the whole system. Such is the immediate and satisfactory effect that *it is warranted to break up the most distressing cough in a few hours time*, if not of too long standing. *It is warranted* to give entire satisfaction, even in the *most confirmed cases of Consumption! It is warranted not* to produce costiveness (which is the case with most remedies), or affect the head, as it contains no opium in any form. *It is warranted to be perfectly harmless* to the most delicate child, although it is an active and powerful remedy for restoring the system. *There is no real necessity for so many deaths by Consumption*, when Allen's Lung Balsam will prevent it if only taken in time. Physicians having consumptive patients, and who, having failed to cure them with their own medicine, we would recommend to give Allen's Lung Balsam a trial. *Sold by all Druggists.*

PERRY DAVIS' VEGETABLE PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat. Coughs, &c. Used externally, it cures Boils, Felous, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitteu Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

FORESTRY IN CANADA.

The following paper was read by A. T. Drummond, of Montreal, at the meeting of the American Forestry Congress at that city :

Perhaps no trade question has around it at the present time so much interest as that of the conservation of our forests with a view to the continuance of the lumber industry. This industry has once more revived, and very large demands are now being made on our lumber supplies. Public attention cannot, however, be too strongly directed to the fact that these timber supplies are not unlimited. The drain which has been going on for thirty years past on the resources of our forests, has been so vast and so continued that the questions are now being forced upon us—for how long a time CAN these resources be depended on, and what efforts are being made to provide for that supply being continuous? It is perfectly clear that under the present system of farming out the public lands, the time is near at hand when the supply of merchantable standing timber will not equal the demands made upon it, and it is imperative that means should at once be adopted to preserve and recuperate these timber lands. Those who are familiar with the localities—each year extending further northward and westward—where the lumbermen obtain their logs, cannot be blind to the fact that the area in which the pine may be expected to be found of mercantable size and in fair abundance, is not so extensive but that another few years of working the timber limits to the extent done in the past, must result in a marked diminution in our exports of white pine. It is not with timber as with other agricultural products. Reproduction cannot take place in a year or a decade. It must be recolleeted that not until the pino is from seventy-five to one hundred years old is it of good mercantable size for square timber, and that thus at least three-quarters of a century would be required to make these timber limits what they were. And what has been the experience in Maine and Michigan? The pine forests of both these States were thought to be inexhaustible, and gave employment to many thousands of men. Bangor, on the Penobscot, was one of the busiest spots in New England—so many mills lined the river banks, and so many vessels frequented the port for lumber. Now the scene is largely changed. The pine lumber manufactured there has fallen from 102,000,000 feet in 1856 to 63,000,000 feet in 1866, and to 14,000,000 in 1877, whilst the total production of pine, spruce, and hemlock boards was not in 1877 one-half in amount what it was in 1866. Again, in Michigan, the Saginaw Valley is being rapidly depleted, and to supplement the supply to its numerous mills, whose capacity is 600,000,000 feet, logs have to be brought from other large rivers long distances away. But most important of all is the fact that the lumber journals of the Western States admit that in the three states of Michigan, Wisconsin and Minnesota—the main sources of lumber supply in the West—there does not, with the present demand, remain of standing pine timber sufficient for ten years to come.

Even greater destruction has resulted from forest fires, not only by reason of the immense areas through which the fires sweep, but because both large and small trees are alike destroyed. Another incidental but most important result arises from the fact that after forest fires, the first growth always consists of poplar, birch and other trees, though whether the pine, which is of slower growth, gradually in the course of long years, asserts its position and overshadowing these in turn replaces them, is a question which observation has not yet had time to settle.

Tree planting has not yet impressed itself on the people of Ontario and Quebec as an idea necessary to carry out. Hitherto, the ambition of most farmers appears to have been to clear the land as soon as possible, and to be content if enough of wood suitable for fuel and farm use is left. Whilst lumber was cheap and the supply appeared almost inexhaustible, it would not appear necessary to most land owners to provide for the future. Besides, men are selfish, and disinclined to go to labor and expense in regard to what does not promise immediate results, the advantage of which they will not themselves reap. And yet if we revert to the condition of the Ontario Peninsula, as it was fifty years ago, abounding in splendid walnut, whitewood, pine and oak trees, nearly all of which have been cut down long since, and when we remember the greatly increased value which, especially walnut, lumber now has, we cannot help seeing of what immense benefit to the rising generation it would be had the trees, as cut down, been at once replaced by young trees of the same species. Already many of these young trees would have been of fair marketable size. The Maine Board of Agriculture in a memorial presented to the State Legislature, very pointedly refers to the duties of individuals on this question. "Men need to be taught," says the memorial, "that we have no moral right to follow blindly an instinct that leads only to present personal advantage, regardless of widespread future evils as a consequence ; that we are but tenants of this earth, not owners in perpetuity ; and that we have no right to injure the inheritance of those who succeed us, but rather a duty to leave it better for our having occupied it the allotted time. Men need to be taught to plant trees and their children to plant and love them. Owners of good lands in Maine or elsewhere will in the future learn that their bleak fields, if judiciously planted with wood to the extent of 40 per cent. of area, will produce on the remaining 60 per cent more in all kinds of crops than the whole does now or can be made to do under any other possible course of treatment. Lands well sheltered can and do produce winter wheat in Maine as well as in New England or on the new lands at the West." In accordance with this memorial, the State Legislature provided for exemption for twenty years from taxation of all cleared lands on which forest trees had been successfully cultivated for three years, and maintained a thriving condition thereafter. Nearly all of the Northern and Western United States have in this way statutes to encourage the planting and growth of timber trees, and the effect of encouragement in this respect has in the Western States been most valuable.

Prof. Sargent, of Harvard University, tells us that "as moderators of the extremes of heat and cold, the benefits derived from extensive forests are undoubted, and that our climate is gradually changing through their destruction, is apparent to the most casual observer. Our springs are later ; our summers are dryer, and every year becoming more so ; our autumns are carried forward into winter, while our winter climate is subject to far greater changes of temperature than formerly. Twenty years ago peaches were a profitable crop in Massachusetts ; now we must depend on New Jersey and Delaware for our supply ; and our apples and other orchard fruits now come from beyond the limits of New England. The failure of these and other crops in the older States is generally ascribed to the exhaustion of the soil ; but with greater reason it can be referred to the destruction of the forests which sheltered us from the cold winds of the north and west, and which, keeping the soil under their shade cool in summer and warm in winter, acted at once as material barriers, and reservoirs of moisture."

The influence of belts of trees on local climate is, in fact, very marked. They form obstructions to and ward off, on the one hand, the cold winds from the north which would lower the temperature and, on the other hand, the parching winds which would unduly raise the temperature and equally injure vegetation ; they break the effects of storms, and in the winter time cause the snow to be equally distributed over the fields, forming thus a uniform protective covering to the ground ; and if generally distributed over the western prairies they will promote the more equal distribution of the rainfall, and will prevent the streams from being dried up, as they usually become after midsummer. Observing agriculturalists have found that fields protected by belts of trees yield crops much more prolific than those not so sheltered.

In our timber regions the replanting of the pines can be to some extent left to nature, but there is every reason, since the timber limits belong to the Government, and a large annual revenue is derived from them, why the Government should, especially in the land which has been burned over by forest fires, institute a regular system of tree planting. There is all the greater reason for this because of the fact that, after a forest fire, trees of different species from those which were previously there, usually spring up. The expense would be comparatively trifling, and certainly insignificant, when placed beside the results which posterity would derive from it. To individuals there may seem little inducement to plant pineries which may not be available to the fullest extent for towards three-quarters of a century, but Governments can have no such feeling, considering that what would be done by them would be for the future benefit of the country and a source of revenue in that future as well. What the Governments can and should also do is to, as far as possible, by legislation and the insertion of clauses in their leases of timber limits, prevent the occurence of forest fires and preserve the younger trees from injury at the hands of the lumbermen. The experience which we are yearly realizing of gradually diminishing areas of timber supply and the now nearly exhausted condition of the United States pineries, makes this matter a subject of pressing national importance which, if our legislatures do not now take up, they will probably find twenty years hence that it is too late.

The question of tree planting must arise in our North-West, and the sooner it is grappled with, the better for the welfare of the future millions who are expecting to people the vast prairies west of Winnipeg. In the matter of fuel alone, its importance may be estimated from the fact that there are extensive tracts of western territory where the farmers journey from ten to twenty miles by waggon or sleigh in order to obtain fuel, or where they have to rely solely on the wood train which at intervals supply them ; and such farmers are often exposed to positive suffering when extensive snow blockades take place. The prairie farmer, indeed soon knows the value of a belt of trees on his farm, not merely as a source of fuel and fencing, but even more as a windbreak warding off the fierce blizzards in winter, and in summer sheltering his growing crops, fruit trees and stock from the strong prairie winds which, developing into storms, cause almost every season vast injury.

It is not at all improbable that the planting of forests on the prairies in Manitoba, Dakota and Iowa, will be the solution of that most embarrassing problem—the grass-hoppers—by affording obstructions to the high winds which bring these insects from their habitats farther west, and by furnishing suitable homes for myriads of birds which would keep the increase of the grass-hoppers in check.

The planting of forests will also probably solve the question of the successful growth of fruits in Manitoba and the Northwest. Fruit trees need protection alike from storms and from parching winds, and especially in our western prairie country is this necessary. It has been laid down as almost an axiom in the western States, that the forest trees must precede the fruit trees in order to afford such protection.

In Minnesota an earnest effort has been made to encourage the planting of trees. A State Forestry Association has been organized, and annually offers premiums for the largest number of trees planted on a day in May denominated Arbour Day. It is estimated that in the spring of 1877 there were 5,290,000 trees planted in Minnesota, and of these over half a million were put in on Arbour Day. During the entire planting season of that year it is believed that about ten millions of trees were planted, and of these, that about seventy per cent. have lived.

The question of tree planting is one which should be actively taken up at once in our Northwest. The Government of Manitoba could not grapple with a more pressing subject for legislation, unless it be drainage. The greatest drawbacks against which the Northwest has to contend, from an agricultural point of view, are wet lands, scarcity of timber, and liability to high winds, and, in some localities, to summer frosts. Dakota and Minnesota have equally these drawbacks. The Manitoba Legislature has taken up the question of drainage, and active efforts are now being made in some parts of the country to reclaim the wet lands. To cope with storms and frosts seems hopeless, and yet experience has found the great value of belts of trees around each farm as affording effective shields against these. What the Government there should do is to promote Forestry Associations, and to, in every way, encourage tree planting by exemption from taxation or by direct premiums or bonuses. Any such encouragement successfully followed up will be returned one hundred fold in the larger and more certain crops, the store of wood for lumber and fuel created by the growing timber, the relief from the monotony of the prairie landscape through the belts of trees dotting the scene on every side, and not least, in a more contented and prosperous community of farmers.

THE LITTLE PINES.

MALVERN, ARK., February 5, 1883.

A correspondent of the *Northwestern Lumberman* writes as follows :—

You ask, in your issue of January 27, the cause of the absence of young pines in the vast yellow pine forests of the south, and discredit the theories of their being killed off by the annual fires and by hogs. In the early summer, after a very wet spring, the hogs are troubled with kidney worms, more or less, and when thus affected they eat the roots of the young trees. Again, the fires, in a yellow pine forest of any density, are slow fires of sufficient vigor and duration to kill off trees five or six years old. Another reason is that the pine straw keeps the seed away from the soil to a very considerable extent, and it is eaten by birds, squirrels, etc. These, however, are not the main causes. The lack of light and heat is against the young trees in the deep woods, and without these the yellow pine is a dwarf in the richest soil. The observer will notice primitive forests in all the old fields of the south in nearly every stage of growth, from the infant plant to the tree of 20 inches in diameter. Here, a field of one year's growth, completely filled with trees knee high, and as thick, so to speak, as the hair on a dog's back ; another of some three years' growth, with the future forest a little marked out by the sturdy growth of, say, 10 per cent. of the little trees, the smallest beginning to show the effect of the shade ; then another of five or six years' growth, showing the effect of last fall's burning over—all the little ones entirely burned off and one-half of the larger ones killed, leaving enough to shade the ground perfectly ; still another field presents a clearer demarkation of the future timber land, all the trees having an appearance of being the same age, yet only about one-third of them promising more than a stately sapling.

The young pine growth in stumpage clearings bids all fear of a lumber famine to "gie awa :" and although it is true that the same soil will not produce the same kind of pine where the loblolly has grown, it is not true of the long-leaf, the yellow pine par excellence of the United States. This variety reproduces in the same soil with increased vigor, caused by the more regular fires of the settlers, who are sure to be found where the saw mills have been—who burn off the woods every year to improve the range and prevent forest fires, thus keeping the young forest thinned out, admitting air, sunshine and heat. —W

PULP MILL IMPROVEMENTS.

The *Northwestern Lumberman* says :—The Umbagog Pulp Mill Company, of Livermore Falls, Me., has been making improvements. A canal has been dug, and general changes made, which are thus outlined by a local paper : The main building has been removed down the river 220 feet, and a heavy wing dam extended from the main dam to the mill. The mill is now 36x70 feet in size, with an L of 25x30 feet, three stories high, used for boiler, store and finishing room. The flume of the mill is laid on the solid ledge. The material is of the best pine lumber bolted together in the most thorough manner, and the iron required for making bolts and rods for the flume is estimated to weigh 6,000 pounds. The flume is 50 feet long, 12 feet high and 16 feet wide on the inside, with an extension on the front to receive the bulkhead, in which are five gates, each 5x6 feet. The flume, with the extension, is 28x16 feet on the front. The driving power will be supplied by six water wheels of the most im-

proved pattern, under about 18 feet head. Four grinders will be placed in position at once· The log will be taken from the river, pass over a large circular saw, which will cut the bolts into right lengths for use. They will then be carried by a belt to the barking-machine; from thence to the double splitting machine, which will require four men to run it, and thence to the grinders. After leaving these, it is conducted below, into steam cylinders, and pumped by power, on the wet machine, so called, where the fiber is separated from the water, and taken off in sheets of clean. white pulp, suitable for making into paper, paper boxes, etc. It is then packed in bundles of 100 pounds each for market. When the mill is fully equipped, it will furnish employment for about 40 operatives.

Importance of Small Industries.

Speaking in Congress the other day of the need of encouraging certain relatively small industries, Senator Miller referred to the city of New York, the greatest manufacturing city in America—he might have said in the world—and "yet she has not a cotton mill, a blast furnace, or a rolling mill within her borders. Her manufactories are small," he said, "but they employ more than a quarter of a million people."

It is worthy of notice in this connection that while recent patents have much to do with the means and methods of the great staple industries, such as steel and iron production, iron milling, cotton and woolen manufacture, and the like, the smaller yet in the aggregate immensely important industries are almost wholly based upon and due to the development of recently patented inventions.—*Scientific American.*

The Tariff Question.

The *Northwestern Lumberman* says:—The tariff question still broods like a cloud of doubt over the lumber business, especially at the East. A correspondent from Nova Scota writes that an unusual effort is being made in that province to get in a large log crop. It is possible that the operators have an eye to the removal of the lumber duty, and intend to be ready for the main chance as aginst Ottawa and the Georgian Bay. It is noteworthy, however, that wages in Nova Scotia are higher than in previous years, and that labor is scarcer. It is barely possible that lumber cannot be produced any cheaper in the Dominion than on this side of the line, which would equalize the value of forests products on both sides as naturally as water finds a level.

Red Lake Pine.

Jhe Gaand Forks *Plaindealer* says that the men interested in the growth of that place still have their anxious eyes on the Red Lake pine, and do not intend to be put off their gaurd because there is silence regarding the Washburn bill. The *Plaindealer* asserts that the pine of the Red Lake region is tributary to Grand Forks, and that city has the enterprise and capital to obtain and manufacture it into lumber, which can be furnished to the country to the westward at prices lower than are paid at Minneapolis. Every move is watched, the friends of Dakota in Congress are kept posted as to the wants of the territory, and it is hoped that the schemes of the Minneapolis men will be baffled.

The Tariff and Hemlock.

The Saginaw valley lumbermen are especially exercised about the effect of the tariff bill on hemlock lumber. One of them is said to have reported that the vast quantity of hemlock in Michigan is just coming into market, but if the duty on foreign lumber is removed, the Wolverine hemlock cannot compete with the Canadian product in Eastern markets. The country in northern Michigan is being cleared up, and the hemlock will be burned up if it cannot be cut and marketed. For this reason it is thought that placing lumber on the free list will particularly damage the hemlock interest.—*Northwestern Lumberman.*

The U. S. Tariff.

The *Northwestern Lumberman* say:—The opponents of free trade in lumber have bestirred themselves since the senate act in placing lumber on the free list, and thousands of names have been forwarded from all parts of tho Northwest in opposition to the measure, while the promoters of the petition movement at Chicago have been flooded with correspondence urging, in nearly every case, the holding of a convention. As, however, it is deemed certain that the question will not be settled by this congress, or, if reached, will be defeated, it is not considered advisable by the Chicago committee to call a convention at this time.

A THOROUGH dosing of raw turpentine will clear hickory of the ravages of worms, destroying those already at work in the timber. It is a good expedient for carriage makers and others.

A GRAPE-SHOT has been found imbedded in a pine tree in Jackson county, Ala., seven miles west of the Apalachicola river. It is supposed to be a relic of one of Gen. Jackson's Indian fights in the Seminole war.

THE *Northwestern Lumberman* says:—There was lately cut at F. N. Wright & Co's. camp, a little north of Stanton, Mich., a forked tree, which turned out 31 logs, but one having been rejected, 30 sound logs were obtained from the tree.

THE *Northwestern Lumberman* says:—House & Bros. are buying bird's-eye maple in Ogemaw county, Mich., to be shipped to New York city for veneering purposes. They will have shipped from Ogemaw county, when they have done, 50,000 feet. They are paying $11 a thousand.

WHAT is called the boss cherry log of the country was recently got out at Potter, Pa. It was cut by James McNultv on Bingham's land at Ellison's pond, was 18 feet long, sound and clear, and scaled 1,550 feet. The scaler pronounced it the largest and finest cherry log he had ever seen. It was all there was in the tree, weighed 10,850 pounds, and was worth $150.

JAMES HARRIS, of Rising Sun, Ind., while engaged in sawing veneering from a walnut knot, discovered in the twisted fibres of the wood a perfect delineation of a spaniel's head. The lines are said to be as accurately drawn as if from the pencil of an artist, and so true is the semblance that even the expression of mute intelligence one often sees in canine visages is readily seen.

IT is stated there are now more hemlock logs in the Allegheny river, Pa., between Condersport and the State Limits mill than there ever was before. The sleighing has been good and the streams frozen over. On account of unfavorable hauling conditions, it is said there was two years' supply of logs back in the woods at the opening of the present season. There is estimated to be 40,000,000 feet of logs in the water.

THE *Northwestern Lumberman* says:—The Flint & Pere road, in Michigan, is running about 15 log trains. The quality of the logs brought out is said to be better than those of last year. The Harrison branch of the road will be extended 12 miles beyond Harrison, which will increase the product of the road about 500,000,000 feet, while the branch built last fall from Coleman will open up about 700,000,000 feet.

Letter from Member of Congress.

HOUSE OF REPRESENTASIVES,
Washington, D.C., Feb. 19, '82.

GENTLEMEN,—Inclosed find $1, and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a had cold, as has almost every one else here, but cannot find the Elixir, which I used frequently at home and consider a most valuable medicine; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GROUT.

LITTLE BY LITTLE.—The constant dropping of water will wear away even the hardest stone. So the constant irritation of a cough will so wear upon the lungs as to induce incurable Consumption. Hagyard's Pectoral Balsam will cure the worst cough, speedily and effectually.

WALTER LINTON, of Waterloo, writes that Hagyard's Yellow Oil has done great good in his family, his wife being cured of Callouse lumps that other medicines failed to remove, he he also states that a neighbor was promptly relieved of Rheumatism by the same remedy.

The American Hotel,
BARRIE, ONT.
Collier Street, Adjoining the Market.

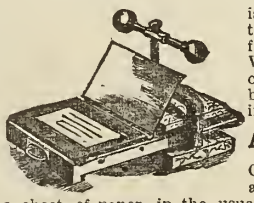
ZUCCATO'S PAPYROGRAPH


is a new invention for the rapid production of fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.
Autograph Letters
Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet
500 COPIES PER HOUR
may be printed upon any kind of dry paper, or other material, in a common Copying Press.
This is the Most Simple, Rapid and Economical Process yet Discovered.
THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.
The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.
For specimens of work, price-list, etc., address with stamp.
THE PAPYROGRAPH CO.,
43 and 45 Shetucket Street, Norwich, Conn.

Office, Wellington Street, OTTAWA. 1Ltf

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once, Costly outfit and terms free. Money made fast, easily, and honorably. Address TRUE & Co., Augusta, Maine.

EARS FOR THE MILLION
Foo Choo's Balsam of Shark's Oil
Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.
This Oil is abstracted from peculiar species of small White Shark, caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has Existed among the Chinese People. Sent, charges prepaid, to any address at $1.00 a bottle.
Hear What the Deaf say!
It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.
"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. MARCH 1, 1883.

AN Ottawa correspondent says :—The timber cut on the Mattawan this year will bo an unusually large one.

THE demand for California redwood in the east is increasing. It takes a good finish, and presents a good effect.

ARKANSAS claims to possess more valuable hardwoods than any state in the Union. Her forests are attracting considerable attention.

A TREE was recently cut in Hemstead county, Ala., that measured 26 feet in circumference. It took six men, working contantly, half a day to foll it.

THE throne to be used at the Czar of Russia's coronation has been ordered. It is to be made of black oak, richly carved in antique Slavonic patterns, and will cost over $8,000.

THE *Northwestern Lumberman* tells us that it is said that T. B. Walker, of Minneapolis, Minn., sends logs into Manitoba, and has them sawed there. He thus escapes the duty on sawed lumber, and makes well on the scheme.

ACORNS from America are in demand in Europe, for the propagation of oak forests. A special agent for the forestry department recently shipped 300 bushels of red oak acorns and 120 bushels of pig nuts to England and Germany, where they are to be planted next spring.

THE *Northwestern Lumberman* says that Robert Jackson and a Canada party talk of building a mill at Depere, Wis., for the purpose of sawing a quantity of Menominee pine that he owns. The logs will be towed on Green bay to Depere. They intend to saw 10,000,000 feet this year.

THE Ottawa *Citizen* says that parties down from the Kippewa say that the timber cut there this season will be considerably larger than that of the preceding year. The snowfall has been such as to render the work more easy than in general. Some forty shanties are in operation, worked by well-known Ottawa firms and jobbers.

THE floods have been doing an immense amount of damage through various sections of the country, particularly in Ohio and Pennsylvania. A recent estimate for Ohio placed the lumber carried away by overflowing streams at 25,000,000 feet, and shingles at 15,000,000. The damage has been heavy since these figures were made.

THE Hon. William H. Stiles, of Franklin county, Vt., in a recent address, stated that he was somewhat surprised at the size of spruce logs that were recently taken from land that was cleared of that kind of timber down to trees 12 inches in diameter 30 or 40 years ago. The logs now taken off are, some of them, 16 to 18 inches in diameter.

ENGLISH milling engineers are introducing square rope belts, which are said to be very suitable for transferring power. They are made in strips with "step" joints, screwed together; the sides of the rope leaving the pulley groove without loss of power. It is stated that 1½ inch rope, at 4,000 feet a minute, has driven over 100 horse power.

The *Wood-Worker* says :—It is predicted that the prices of walnut lumber will rule somewhat lower the coming season. The reasons for this belief are the extensive additions to facilities for cutting and transportation, in the way of new mills and tramways through herotofore inaccessible sections. Yards havo full stocks of this lumber, with a dull markct and weak prices.

THE Tennessee Lumber Company has built a large new mill at Cincinnati. The building is 50x100 feet, and two stories. Several railroads have access to it. A tunnel reaches from the mill to the Ohio river, by means of which logs are driven on a truck direct. The mill will be well equipped. The company has another mill at Chattanooga, and one at Hinch Mountain, Tennessee.

THE *Monetary Times* says :—It is the opinion of lumber dealers that a shortage in production is to be expected this season in the Northern Ontario district—with which may probably be included the Western Peninsula—equal to 20 per cent., under an averago soason's product. The excossive depth of the snow has kept operations back, and the increased cost of lumbering has deterrod some oporators. American buyers have not appeared in this market as yet; a feeling of uncertainty as to the pending action of Congress on the Tariff probably keeps them back. Meantime the feeling here in lumber is firm and some lines of dry are likely to be scarce.

THE St. John, N. B., *Telegraph* says :—Lumbermen in this province report that the present winter has been a most advantageous one for their operations. There is plenty of snow in the woods for hauling, while it is not over deep; the crust has not been hard and the brooks have kept woll frozen, the weather having been clear, cold and steady throughout, Considerable business is being done in ship knees and futtucks, which are bringing better prices than have been obtained for many years. Most of this class of timber at present being got out, goes to the United States market, whore the demand for it is very strong. The season has been very favorable for digging the roots, the frost not having gone very deep into the ground.

THE SOUTH VS. CANADA.

The New Orleans *American Lumberman* discourses as follows :—The Chicago lumber dealers represented by the Chicago Lumber Company, effected an association a few days since. They favor free lumber from Canada, and to that ond they agreed upon a heartrending petition to Congress to admit lumber free from Canada. After alluding to the census statistics, which they presume are incorrect, from the fact that they believe there is enough white pine standing to supply the country for twenty-five years, they then quote the prices of lumber in 1878 and 1883, to show that the advance in the lower grades has been from 45 to 65 per cent. They continue: "The upper grades of lumber have advanced in still greater ratio, showing plainly that unless new markets of supply be opened, lumber in the future will be a luxury only attainable by the rich, while all improvements and settlements in the new states and territories must cease."

Their panacca is free lumber from Canada, but seeing at once that this alone is an argument of no special value, they turn tail and bid for the support of their opponent in the following manner: "In fairness to the men who object to free lumber, from a feeling that it will greatly and suddenly depreciate their property in pine lands and logs, we call your attention to the fact that the entire present capacity of the saw mills of Canada is not of sufficient volume to materially lower prices, and it is not so much to lower prices as to guard against continued and ruinous advances in the price of building material, so essential to the development and progress of our country, and the total extinction of our white pine forests, with all its deplorable consequences, placing the citizens of our country at the mercy of foreigners, who control the only available white pine accessible to our country."

If this association would exhibit as much zeal in getting fair rates of freight from the South to Western points, as they do in getting lumber from Canada, they could easily find a sufficient supply of the best of lumber—which is not rated a luxury, by a good deal. Let them help to develop the forests of the South first, then they may turn their attention to Canadian interests.

KNOCK-DOWN HOUSES.

The Bay City *Call* calls for somebody in that wood-working city to engage in the manufacture of houses in the "knock-down," and suggests particularly the probability that a good business in this direction can be done in furnishing ready-made houses for summer resorts. The suggestion is a good one. It has come to be such a fashion for people of independent means —and some whose means are not so very independent— to "resort" to the eligible sites on the shores and islands of the great lakes for a summer sojourn, that there is a great demand for light structures in which to live during the season of relaxation. Doubtless many more people than hitherto would seek a summer retirement if a handy means of obtaining a neat and comfortable pavilion were provided. A ready and sufficient supply always creates a demand greater than would otherwise exist were there no such supply. Now that the summer-resort boom has grown to such considerable proportions, it seems as if the furnishing of ready-made cottages on a large scale could be made a profitable business. The same scheme might embrace the supply of necessary light, portable furniture. Then a resorter could order his out-fit of the knock-down house factory, have it shipped to the designated locality the same as he would his trunk, and in a day or two after arrival he would be living comfortably under his own roof by the lakeside. If the scheme were once under full headway it would become very popular, and develop an important industry in the preparation of portable summer cottages.—*Northwestern Lumberman.*

UNITED STATES TIMBER LANDS.

Congressman Valentine proposes to make the woodsman spare the tree by law. He lately introduced in the house a bill, the provisions of which direct the secretary of the interior to withdraw from market the fine timber lands remaining undisposed of, which are chiefly valuable for fine timber of merchantable value. It furthsr directs him to employ a sufficient number of examiners skilled in woodcraft to make an examination of the pine lands already surveyed, and report a full description of them, giving the quality and quantity of pine and other timber growing thereon, the distance from navigable streams and railroads, and such other matters tending to fix the value of the land. It provides that a copy of this report shall be filed at the local land office, and a copy with the secretary of the interior. It makes it a crime for any examiner to file a false report, punishable by fine and imprisonment. After the making and filing of the reports the secretary of the interior is authorized to offer the lands for sale in the manner now prescribed by law, but the notice of sale shall contain a description by legal subdivisions, and the quality and merchantable value of the lands. The reports of the examiners are to be at all times open to inspection. Any land offered for sale and remaining unsold shall thereafter be subject to sale at private entry at their appraised value.—*Northwestern Lumberman.*

THE NIPISSING DISTRICT.

We have given at full length the reports of two of the most important surveys in the District of Nipissing, and we must be content with extracts relating to the remaining townships.

TOWNSHIP OF DUNNET.

Mr. R. A. McEvoy, P. L. S., says :—There is some valuable pine timber in the township, the best being in the central part as shown by timber map. A small area of maple was found on lots four and five, concessions four and five. The remaining green bush is balsam, spruce, tamarac, cedar birch, and poplar. On what is known as brule, a thick growth of white birch, poplar, cherry, etc., has sprung up.

TOWNSHIP OF HUGEL.

Mr. W. O. Johnston, P. L. S., says :—The greater portion of this township has been overrun by fire and the timber destroyed. Some of the north part has also been burnt again last year. The northwest corner of the township, however, is green bush and contains a considerable amount of good pine, but the other timber is not of marketable value, being mostly white birch, small spruce, balsam, tamarac, and some poplar.

TOWNSHIP OF RATTER.

Mr. F. Bolger, P. L. S., says :—The township is generally level throughout and contains little good land. The face of the country is rocky and stony, with light sandy soil, the prevailing timber being white and red pine, balsam, poplar, white birch, with scattered groves of hemlock and tamarack.

Towards the centre of township pine predominates of a merchanteable quality. The westerly part of the township has been burnt over, all the timber being utterly destroyed, about one sixth of the township has thus been devastated.

TOWNSHIP OF KIRKPATRICK.

Mr. C. D. Bowman, P. L. S., says :—Nearly the whole of the township has been burnt over, there being only about eighty chains of unburnt land found along the lines run, the balance being thickly grown up with small poplars, birch, alder, etc., with occasionally the trunks of large dead pines, while in some places there was no trace of the original forest left.

There being no squatters or improvements in the township no inspection returns will be required. The whole of township with the exception of about twenty chains on the west boundary and a few chains on the front of the sixth concession, being brule, no timber plan will be nccessary.

TOWNSHIP OF HAGAR.

Mr. F. Purvis, P. L. S., says :—Bush fires have destroyed nearly all the timber. The only pine, or in fact any timber worth mentioning, is on lots one and two, concessions, one, two, and three. There is a small island of timber at the junction of the northwest branch with the La Veuve River, and another in lot eight, concession five. That portion of the township lying south of the river is a brule, with scattered red and white pine, with some tamarac, balsam, and white birch, aud is covered with dense undergrowth and fallen timber.

TOWNSHIP OF DRYDEN.

Mr. F. O. Bolger, P. L. S., says :—Its timber timber resources are very limited, the greater portion of it having been destroyed by fire. Along the northern boundary—in several instances extending over the sixth concession—some good pine exists, either in groves or in a scattered form.

The only stream calling for notice is the Wahnapitae River, which has a large and constant flow of water, admirably adapted for the driving of logs and timber, although much broken by falls and rapids.

TOWNSHIP OF WILKES.

Mr. J. W. Fitzgerald, P. L. S., says :—That part of the township lying south and east of Tea and Manitou Lakes and north concession ten can only be described in a general way, as a

tract more or less broken by ridges of hardwood and mixed green timber separated by swamp valleys in which the prevailing timber is tamarack. In the uplands where maple, beech, and birch predominate the land is stony in many places to such a degree as to render cultivation impossible.

The timber is very mixed and mainly consists of hemlock, spruce, tamarack, white birch, poplar, balsam, etc., mostly under average size. There is but little pine scattered over this part, although tamarack and spruce of fair dimensions are occasionally seen.

It may be worthy of remark here that although the country for miles north, east, south, and, I believe, west of this township, has been lumbered over for thirty years years or more, not one stick has yet been cut in it for that purpose.

The township also is singularly free of fallen timber. Excepting along the north shore of Long Lake on the south boundary, and for a distance of about half a mile east of it no evidence of fire or fallen timber to any extent was met with on the survey.

SPRUCE AT LIVERPOOL.

The *Timber Trades Journal* of Feb. 10 says: Our Liverpool correspondent, referring to the article of spruce deals at his port, last week, wrote:—"The consumption for this month has been nearly four and a quarter times as great as that of last year. From this it might be inferred that the case-making and building trades were in a most flourishing condition, but he would be a bold man who would assert this to be the fact; but if we look a little further we shall find that much of this excess is attributable to the increased imports, which are 1,150 standards in excess of last January, and this has been forced of by auction at low prices, in addition to the ordinary cousumption through private sales." Another factor which has operated to increase the recent consumption of spruce deals, or rather to draw from Liverpool for consumption inland, was that when spruce deals were selling at over £8, as they were some three months ago, inland buyers relied as much as possible upon their stocks, aud bought only what they actually required for immediate use, and which their stocks would not supply them with. Consequently, stocks inland became seriously reduced, and on the arrival of the new cargoes, which were offered at moderate figures, the opportunity for re-stocking was made use of. Whether, when stocks are made up to the average, the present rate of consumption of spruce will continue appears to be doubtful.

MIRAMICHI PINE DEALS.

The following letter appears in the London *Timber Trades Journal*:

SIR,—The paragraph in a colonial contemporary directing attention to the remark which appeared iu this *Journal* some time back anent the rapid decay of Miramichi pine deals when standing in the pile, has induced me to seek for the cause which produces the effect. That Miramichi deals do decay more rapidly than Quebec deals is certain. It would appear that the wood possesses constituents which encourage or provide for fermentation, for when the deals are piled with any insufficiency of air space fungus almost immediately forms. Dry rot in any case attacks Miramichi deals that are kept long in stock, and this fact makes holders always anxious to quit them.

The cause of the rapid decay is unquestionably of a chemical nature. and I should say it is the presence of vegetable acids peculiar to the material which gives to the wood this unfortunate character.

My observations, I should add, have not been made in London, for I have no experience of the wood trade there.

HEMLOCK BARK.

The *Shoe and Leather Reporter* says that the tanners of this country are periodically treated to prophetic warnings that the time is not far distant when they must seek some other tanning agent than hemlock bark, as the forests are becoming rapidly denuded. This hue and cry of short supply is not confined to bark alone. The reminders are quite as persistent that as there has been no epidemic in South America during the past year, all must run short of nips for upper leather. Forebodings of scarcity of hides and of bark have been so often repeated that they would receive little heed now, even if there were any ground for them. The bark supply shows no sign of diminution. Dealers did for awhile scare consumers into putting up prices from $9 to $13 per cord in Woburn and Peabody and other tanning towns in Massachusetts, but that set the peelers at work in such a lively way that the tracks at the large distributing points were crowded to excess to accommodate the heavy shipments, and hundreds of cars incumber the side tracks. The market has weakened; contracts have been closed for large quantities at $11.50 per cord, and the tendency is still downward. In the meantime, with high-prieed hides and bark, and low-priced leather, the tanners are having a bad siege of it. There may come a period when bark will be a scarce article, but it is too far in the future to have any place in our present calculations.

THE ENGLISH TRADE.

Messrs. James Smith & Co's. circular says:—For the year now opening much will depend on the action of the trade on this side, as well as on the demand from the Continent, the Colonies, and the United States, all of which are now becoming very large consumers; and as the cost of production of timber is everywhere becoming enhanced, through scarcity of men, higher wages and cost of provisions, and longer distances to haul the logs, prices generally may be considered much too low, and without firmness and caution in buying and shipping no good result can be looked for this season to shippers or receivers. As regards the freight market, the class of wood vessels, usually brought into this trade is fast disappearing by loss, and is not being replaced, except by steamers, which are, so far, not so convenient and workable as sailing vessels, and the rates for which cannot be so reliably calculated, being more susceptible to severe fluctuations. There is no doubt that the various ports will soon have to meet this great change, as the present dock system is far from being applicable to steam carrying for the wood trade. Rates are slightly firmer than last spring.

HEMLOCK IN THE STATES.

The *Northwestern Lumberman* says:—There is a firm feeling that there will be a decided decline in Pennsylvania hemlock lumber this season. The facilities for getting it have never been so large as they will be this year. Railroads have been constructed recently that tap extensive hemlock forests, and will give outlets that heretofore have been closed. One thing is in favor of the manufacturers of hemlock lumber—it can be produced cheaply under favorable conditions. Stumpage can be bought very low, and the price is made still lower when the sale of the bark obtained from the trees is taken in consideration. If a man has a mill with plenty of hemlock surrounding it, and can load the lumber on cars right in his mill yard, many dollars per thousand are not required to give him a good profit. We hear of efforts to sell at from $2 to $3 per thousand under prices of a year ago. Possibly, however, the flood in the Susquehanna will change the aspect of things somewhat.

Breaking Up.

It has been stated in several newspapers that the camps on some of the streams were breaking up, with a probability that all work would come to a standstill. Such stories are usually very fishy, and should be so considered. A force that has been obliged to quit creates a great commotion on reaching a settlement. Because these particular men and teams are out of the woods, of course everybody else is breaking camp and will be right down. It's a rare season when there is not more or less breaking up before spring. When the hauling is hard and the expenses run up unexpectedly, it is as natural for the small jobber to get weary and fall by the wayside as for water to run down hill. Occasionally the principal will advance funds to keep the fainting man on his feet—this depends somewhat on what kind of a heart the principal has, and how he looks at the case financially. To help the man along he may consider will be cheapest in the end. There are others who stop work, not for the lack of money, but because if they work at all they are obliged to spend too much of their time among treacherous swamps.—*Northwestern Lumberman.*

Great Tree Planting Contract.

By directions of Sir Henry Loch, K. G., Her Majesty's Commissioner of Woods and Forests, a large extent of Crown land in the Isle of Man is about to be planted with forest and ornamental trees. About 500 acres are now being so planted on the mountain called Archallagan, where cabins have been erected by the contractors for the accommodation of the men. Messrs. Little and Ballantyne, Knowsfield Nurseries, Carlisle, have been entrusted with the contract (one of the largest of the kind ever entered into in Great Britain), and already the first instalment of a quarter of a million of young trees has been shipped from the Carlisle nurseries for the work.

Spruce Gum.

The *Northwestern Lumberman* says:—The loggers of Maine are far removed from society, but they do not neglect to put in their spare minutes in a way that tends to make the ladies happy. They gather all the spruce gum they handily can. Every spruce tree is not productive of gum, but when one is felled that is, the loggers profit by it. Occasionally a live Yankee, with a stock of socks, mittens, etc., wanders up through the woods, and swaps his goods for the gum that the men may have secured. The gum in the woods brings from 30 to 45 cents a pound, and is worth $1 in Portland. In this city it is worth, at retail, $2 per pound.

Notice to Contractors.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Newcastle Harbor Works," will be received at this office until WEDNESDAY, the 14th MARCH, next, inclusively, for the execution of

Works at Newcastle Harbour,

ONTARIO,

according to a plan and specification to be seen on application at the office of the Town Clerk, Newcastle, where printed forms of tender can be obtained.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque, made payable to the order of the Honorable the Minister of Public Works, *equal to five per cent.* of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS.
Secretary.

Department of Public Works,
Ottawa, 19th Feb., 1883. 3d46

FOR SALE!

The MURRAY BAY LIMITS

COMPRISING ABOUT

330 SQUARE MILES.

These limits control the whole territory on the Murray River. The limits are very valuable, heavily timbered with Spruce and Pine, interespersed with valuable hard woods, Poplar and White Birch. Apply to

D. C. THOMSON,

MINNESOTA

PINE LANDS

FOR SALE.

THE SUBSCRIBER OFFERS A TRACT OF

8,000 ACRES

Of PINE LANDS, in St. Louis County, Minnesota, carefully selected and estimated to cut **FORTY MILLION FEET**, well located on good driving stream, tributary to Duluth.

A. McCALL,

6L1 Lumber Merchant, Simcoe, Ont.

NOTICE.

SEALED TENDERS addressed to the Superintendent General of Indian Affairs, and endorsed "Tender for Indian Supplies," will be received at this office up to noon of SATURDAY, 10th MARCH, 1883, for the delivery of the usual Indian Supplies, duty paid, in Manitoba and the North-West Territories, consisting of Flour, Bacon, Groceries, Ammunition, Twine, Oxen, Cows, Bulls, Agricultural Implements, Tools, &c.

Forms of tender and full particulars relative to the Supplies reqnired, can be had by applying to the undersigned or to the Indian Superintendent, Winnipeg.

Each Tender must be accompanied by an accepted Cheque of a Canadian Bank for at least five per cent. on the amount of the tenders for Manitoba, and ten per cent. on the amount of the tenders for the North-West Territories, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to do the work contracted for. If the tender be not excepted the cheque will be returned.

The lowest or any tender not necessarily accepted.

[No newspaper to insert without special authority from this Department through the Queen's Printer.]

FORESTRY REPORT.

We take the following from the report of the delegates appointed by the Ontario Commissioner of Agriculture to represent the Province at the meetings of the American Forestry Congress at Cincinnati and Montreal :—

The delegates, in view of the information obtained at the several meetings of the American Forestry Congress, beg leave to make the following recommendations :

I. That such of the public lands as are more suitable for the growing of timber than for agricultural purpose, be retained by Government as a part of the public domain.

II. That within this timbered tract scattered portions be leased to persons suitable to act as forest police, to protect the timber lands from trespass, guard against fires, remove fallen timber, and act under instructions.

III. That no trees shall be cut, whether pine, spruce, hemlock, or hardwood, on any of the public timber lands under fourteen inches in diameter at the stump.

IV. That no cattle, sheep, or swine be allowed to roam at large in any of the public woodlands.

V. That the lighting of fires in or near any woods from May to October, inclusive, be prohibited, under severe penalties.

VI. That a general stock law be enacted, prohibiting cattle, sheep, and swine from running at large in any part of the Province, unless the municipal council of any municipality shall pass a by-law authorizing their running at large within that municipality.

VII. That encouragement be given to farmers to plant timber lots of not less than ten acres on each farm of one hundred acres, and maintain the same as a timber lot, from which cattle must be faithfully excluded. Such encouragement may be given by exempting the timber lots from taxation so long as the same are maintained and properly cared for.

VIII. That encouragement be given to farmers to plant and maintain shade trees along the public highways and the boundary lines of farms, by granting out of the Provincial treasury, a sum of ten or twelve cents for each tree so planted and maintained in a healthy and growing condition for a period of five years, provided the municipal council of the municipality in which they are growing shall have granted a like sum.

IX. That hereafter it be a condition in all sales or grants to settlers, that not less than twenty-five acres in every hundred shall be forever kept as woodland, under penalty of forfeiture of the whole, and that the covenant be made to run with the land.

X. That scientific and practical instruction in forestry be given to the students at the Agricultural College.

XI. That a competent conservator of forests be employed, with a sufficient staff, and clothed with adequate powers to see to the proper execution of all laws relating to the cutting of timber, lighting of trees, running at large of animals, etc., etc., within the timber lands of the Province.

XII. That as soon as practicable the management of the public forests be assumed by the Government, and all timber be cut and sold, trees planted, pruned, and cared for, and all matters relating thereto be conducted under the supervision of a chief forester.

XIII. That the grounds of the several public institutions be utilized as far as practicable as experimental stations, by planting thereon timber trees that promise to be of practical value, and testing their adaption to these several localities.

XIV. That Government cause accurate maps to be made of each County, shewing the area that has been cleared off, that has been destroyed by fire, and that is yet covered with timber, and indicating as far as practicable the quality of the standing timber.

XV. That a forest of acclimation be established at the Agricultural College, Guelph, in which shall be planted such forest trees of other countries as may probably become acclimated in this country, and prove to be valuable for economical or ornamental purposes.

All of which is respectfully submitted,

D. W. BEADLE,
WM. SAUNDERS,
WM. BROWN,
P. C. DEMPSEY,
THOS. BEALL.

PRESERVING RAILWAY TIES

In Austria, Germany and France there are some 80 roads that use treated ties, and 33 of them have records of successful processes of treatment. The chloride of zinc method, or burnettizing, takes the preference for several reasons. Its practicability is the best established, the objections to its use are few, and the cost is slight. When applied, it is diluted 99 per cent. Kyanizing, or the use of corrosive sublimate, a poison, is dangerous, the workmen who use it running great risks. Convicts are usually employed for the purpose. Creosoting dates back in its use to ancient Egyptian history. Creosote and cedar oil were employed for embalming mummies, and for general purposes of preservation. The common refined tar used contains one per cent of creosote. When timbers are saturated with this they are highly inflammable, but the process is not particularly dangerous to the workmen. There are, in all, some 60 methods of treating timber, only a few of which have borne out a practical test. Pyroxyline of iron is used by repeated application by means of a hole in the timber, the agent dissolving itself and becoming diffused through the vascular tissues. Soaking in salt, using a solution of gas-tar, rosin and linseed oil ; charring the surface to protect the body ; steaming with creosote, to prevent dry mold ; applying sulphate of iron and sulphate of copper, are processes that have met with more or less satisfactory results. A beech fence has already stood 26 years, with sulphate of copper. Where dampness gathered around the spikes or nails driven into the material, a chemical action resulted which induced decomposition. The expedient was adopted of dipping the spikes in tar. There are several solutions employed for petrifying, such as carbonate of lime, alum and potash, steaming with cloride of lime and diluted sulphuric acid, etc., but common or Glauber's salt seems as feasible an agent in this way as any that has been tested. In the German experience, creosote costs eight times more than chloride of zinc. There a tie is treated at a cost of 6 cents, while the Houstan & Texas Central road finds its creosoting process to cost 60 cents per tie. Superheated steam is also held to weaken the wood by destroying the vascular tissues. By simply dissolving old zinc in acid, chloride of zinc can be made for about 2½ cents per pound, or it is furnished in tanks at 3½ cents. The patentee figures the cost of impregnating ties, with the apparatus in proper operation, at about 8 cents each. The average life of a tie is found to be about five years, while preserved ties can readily be made to last, as they have in Europe, 25 to 30 years.

The Royal Railroad Company, of Hanover, Germany, has sent several specimens of burnettized timber by the patented process, as follows: Part of the middle of a pine tie which served on the road from 1852 to 1879 : a piece from the centre of a beech tie which lay in the road from 1854 to 1879 ; a piece from the centre of an oak tie which lay in the road from 1854 to 1879 ; and other specimens. E. Buesch, of the Grand Ducal Railroad, and author of a German work on the subject of timber-preserving, makes some statements of the same character. He tells of pine ties lying in a road from 22 to 25 years, and when taken out, because of damage to the road, they were undisturbed so far as decomposition was concerned, being made into fence-posts and used in other ways. C. Shaler Smith, city engineer of Omaha, Neb., states that the treatment of wood diminishes its tendency to swell or contract, as observed in timbers put into a bridge at St. Louis, the amount of expansion depending on the wood used. He further says : "I used sweet gum, a wood which rots in four months and swells one inch and a half in 16, as the best wood to experiment with, as it could be had at $10 per thousand. The bridge pavement is nearly two years old, is in first-class condition (the traffic is so great that the average life of a three-inch plank was only four months), and out of 1,800 square yards I have had to relay only 260 yards on account of hammocking, and this on the first batch laid; with cedar, oak, pine, ash or elm there would have been no hammocking at all. It is easily prevented by dipping the blocks in coal tar after treatment, or laying them diagonally. I laid the bridge blocks with one-fourth inch joints. Hereafter I will immerse the blocks in liquid asphalt or creosote, and without any joints at all.—*Northwestern Lumberman.*

GERMAN FORESTRY.

At the meeting at Cincinnati last year of the American Forestry Congress the following communication from Richard Von Steuben, Royal Chief Forester of the German Empire, was read.

FALKENBURGH, near Dommitzsch,
District of Torgau,
March 11, 1882.

MOST HONORED SIR,—I thank you most sincerely for your cordial invitation to the opening exercises of the National Forestry Association. It is, however, to my greatest regret, impossible for me to accept the same. Irrespective of all personal considerations, I am bound here by the onerous duties of my position as an officer of the King ; for a trip so far and time consuming, I would have to crave leave of the Minister, which I cannot do so soon after the long leave of absence given me last fall, especially not during the planting season, when the superintending officer can least be spared.

I regret most exceedingly that I cannot attend the opening exercises, since it is certain that your Association will be productive of much good to the whole country. During my stay in the United States last fall I had occasion to discuss the question of the rapidly growing necessity of introducing a regulated Forest Government in order to prevent future calamities which must undoubtedly result from a reckless destruction of the forests. Even the Honorable Secretary of the Interior, at Washington, honored me with a consultation on the subject.

There can be no doubt that every country requires a certain quantity of well stocked woods, not only to supply the demands for building material and fuel, but more especially to secure suitable meteorological conditions, to preserve the fertility of the soil, and out of sanitary considerations. The ratio of the minimum quantity and judicious local distribution of the indispensable forest to the aggregate area cannot be expressed by a universal rule, but the same can only be approximated by scientific investigation. Above all things, it is essential to prevent forest destruction where such would injuriously affect the fertility of the soil. It is important, then to preserve and to cultivate judiciously those forests which stand at the head-waters and on the banks of the larger streams, because through their indiscriminate destruction fluctuations in the stage of water, sandbars, and inundations of arable lands are occasioned. It appears also necessary to preserve and properly cultivate woods in quicksands, or on the summits and ridges, as well as on the steep sides of mountains, along the sea coasts, and other exposed localities.

In Germany, and especially in my more narrow bounded fatherland, Prussia, it is regarded as of the greatest importance, not only to preserve the forests already there, but to extend them as much as possible.

In the National Appropriation Bill large sums are set apart for the purchase of such lands as are unfit for cultivation, and for utilizing the same by planting trees.

In the German Empire 25.7 per centum of the aggregate area is occupied by forests—that is, 13,873,065 hectares out of 53,074,041 hectares. In Prussia the percentage of wooded land is 23.4 per centum of the entire area—that is, 8,124,520 hectares out of 34,750,903 hectares. Of the Prussian forests about one-third belong to the State, to wit, 2,648,892 hectares, which produce a gross income of about fifty five million marks. The Government foresters come within the province of the Minister of Agriculture and Forests. At the head of this department is the Chief Master of the Forests ; in each governmental district is the Forest Master, who serves as a member of the Governmental Commission, and the entire forest area is divided into 680 principal forest districts. Each forest district is separately valued, and for each separate part regulations are devised, which are strictly followed, thus attaining the chief object, of so regulating the annual amount of wood-cutting that a continuous gain in material and money is secured, and even increased. The forest government is devised with the minutest detail, and may well lay claim to being termed exemplary ; it strives not only to utilize the forest as a source of income, but rather are the Government forests used to continually satisfy the requirements of the country.

In order to obtain a situation as Government officer of the forests, a course of study of sever-

al years at the Forest Academy is required. After which follows about ten years' preparatory service before a definite engagement can be made, the qualifications for which must be proved by several examinations even for the minor positions in the Forestry Department; several years' apprenticeship and considerable preparatory service connected with the military service in the Hunters' Corps, and two examinations are required. Besides the real Government forests there are the forests of the Faithful Royal Veterans, Community Forests, Corporation Forests, &c.

The forests of the Faithful Royal Veterans are governed entirely according to the principles of the State Government. The State exercises a supervisory power over the other forests named, so that even as to these a regulated system of government prevails. It is otherwise with forests owned by private individual, for they are not restrained in the use of their forests, and may, according to their own judgment, clear the same, and till the soil, in short, do what they like, and yet there may be certain restrictions placed on the free use of the same as soon as danger to the common welfare is feared; these restrictions are prescribed by the law of July 5th, 1875, relative to forest protection.

This law is applicable in cases:

1. Where by reason of the sandy nature of the soil, adjoining lands, or public grounds, natural or artificial courses, are in danger of being covered with sand.

2. Where through the washing away of the soil or through the formation of cascades in open places on the ridges of hill and on hillsides, the arable lands, streets or buildings lying below are in danger of being covered with earth or stone or of being flooded; or the lands or public grounds or buildings lying above are in danger of sliding.

3. Where through the destruction of the forests along the banks of canals or natural streams riparian lands are in danger of caving, or buildings hitherto protected by the woods are in danger of iceflows.

4. Where through the destruction of forests rivers are in danger of a diminution of the stage of the water.

5. Where through the destruction of forests in open places and near the lakes, neighboring fields are seriously exposed to the detrimental influences of winds.

In the cases above mentioned, which have been copied *verbatim* from the statute book, the manner of use as well as the culture of forests may be legally ordered, in order to prevent those dangers where the dangers to be averted are considerably in excess of the damages which would result to the owner by reason of the restrictions.

Excepting the restrictions prescribed by this law, the owner may dispose of his woods as he pleases.

Finally, permit me to remark that the larceny of wood and other products of the forests is punishable according to a law of April 15, 1878.

It is evident that these Prussian regulations are not at all applicable to the United States, as circumstances are so entirely different there. Unfortunately I am uot sufficiently familiar with them to venture an opinion as to judicious measures to be taken for the protection of the forests, and it would have given me great pleasure to have informed myself on the grounds and to have taken part in the deliberations.

I trust you will grant me the favor to inform me of the result of your sessions, and consider me always ready to give all desired information concerning, as well as our forest arrangements, as our usual mode of planting and cultivating trees; indeed, to give information of all kinds and at all times.

Permit me now, my dear sir, to thank you most heartily for your friendly invitation and to express my sincere regrets at my inability to accept the same. Give my kindest regards to the gentlemen of the committee. I wrote to Mr. Adolph Strauch a few days before the receipt of your letter. I thank you for your friendly wishes, and return mine most heartily.

I am, with greatest respect,

RICHARD VON STEUBEN,
Royal Chief Forester,

THE GLASGOW TRADE.

The *Timber Trades Journal* of January 20, says:—Prospects of the timber trade for the year now entered upon, though not in all respects promising, are of a generally favourable character, its main support being in the great and growing activity of Clyde shipbuilding.

YELLOW PINE.—The stock of Quebec waney board-wood amounts to about the same quantity as last year's, but much of it is of 2nd quality and not easily moved at prices now required. Rates about 2s. 2d. to 2s. 8d. Of square yellow pine, the stock is light comparatively; demand is quiet meantime, its high price being a check on the consumption; other goods at cheaper prices coming into competition. The market is bare of first-class deck-plank yellow pine.

RED PINE.—Stock comparatively moderate; good wood of large dimensions saleable. Recent prices 1s. 3d. to 1s. 7d.

OAK.—The year's import of Quebec oak is about 1,200 logs over that of 1881, and the consumption shows an almost corresponding increase. As a good deal of the stock at present on hand is not of the prime quality it is not so easily moved. Prices from 2s. 6d. to 3s. 5d., varying considerably according to quality. There have been large arrivals throughout, the year of oak-planks and scantlings from the States, per steam liners.

ELM.—Demand at present is quiet. Recent prices 1s. 8d. to 2s. The stock, it will be observed, is little more than half the quantity held a year ago.

BIRCH.—The stock on hand is unusually light. Prices have advanced considerably, especially in the latter part of the year. For Quebec wood, 15½ in. square, about 20½d. may be quoted; and for lower port about 17d, is the average rate, more or less, according to size and quality.

ASH.—The past year's import was light compared to that of the previous year, and the consumption shows a falling off, though not to the same extent. Present demand is fair; pure white wood in especial request. Prices range about 1s. 9d. to 2s. 2d.

WALNUT.—The import during 1882 from the States and Quebec is short of the previous years. Prices for good wood, medium and large sizes, range from 5s. to 5s. 6d., but drop considerably for small and inferior descriptions. The supply of walnut has not been sufficient for the wants of the market.

DEALS.—Quebec yellow pine. There is a comparatively small stock of 1st quality. Rates 2s. 3d. to 3s. 6d.; broad dimensions have brought high prices, 2nd quality are not readily sold. Prices of 3rd quality, the import of which (mostly per steamer) has been excessive, have undergone little change. Prices for 11×3 about 13½d. to 14½d., broad deals bringing a considerable advance. 4th quality, 11×3, sell at about 1s. Quebec spruce deals, 11d. to 13d.; lower port spruce, 10d. to 12d. Not many American spruce deals have been sold in the latter part of the year, the large import of deals from the Baltic coming into competition.

Alcohol and Paper From Wood.

The *Oesterreihischer Liquer Fabrikant* states that Messrs. Bochet & Machard now prepare both alcohol and paper from wood: 2,000 kilos. of wood shavings are treated in wooden vats with 8,000 kilos. of water and 800 kilos. of hydrochloric acid for 10 to 12 hours, steam being passed in the whole time, so as to keep the mass on a constant boil. When this operation is over the acid liquid is run off, neutralized with chalk, and fermented at at a temperature of 21°—25° C. The ligneous residue in the vats is washed and dried and worked up for paper.

Our Neighbors' View.

The *Lumberman's Gazette* of Bay City, Michigan, thus discusses the question of the United States lumber duties:—The lumber interest is thoroughly awakened at the attack made on the prosperity of this industry, and Congress will be besieged next week with powerful delegations representing $9,000,000 of capital and more than 1,000,000 American laborers whose prosperity is also imperilled in order to benefit Canadian industry. It will be strange if Congress refuses to deal justly with this class.

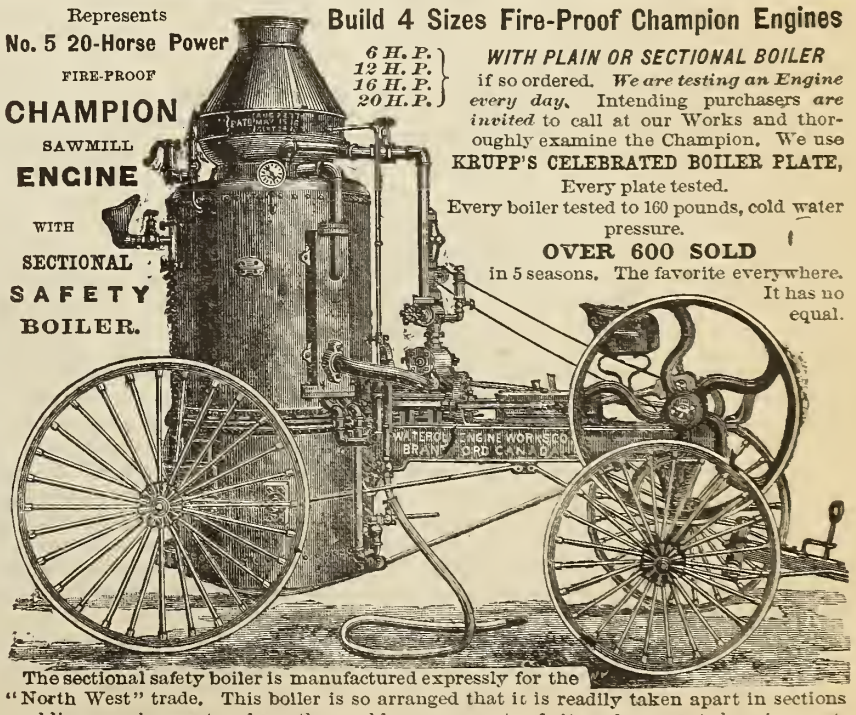
Build 4 Sizes Fire-Proof Champion Engines

6 H.P.
12 H.P.
16 H.P.
20 H.P.

WITH PLAIN OR SECTIONAL BOILER if so ordered. *We are testing an Engine every day.* Intending purchasers *are invited* to call at our Works and thoroughly examine the Champion. We use KRUPP'S CELEBRATED BOILER PLATE, Every plate tested. Every boiler tested to 160 pounds, cold water pressure.

OVER 600 SOLD in 5 seasons. The favorite everywhere. It has no equal.



The sectional safety boiler is manufactured expressly for the "North West" trade. This boiler is so arranged that it is readily taken apart in sections enabling purchasers to clean thoroughly every part of it and prevent burning out. *We know from experience this is absolutely necessary with the alkaline waters of the great Western prairies.* Largely used by the Pacific Railway Company and all the large Colonization and Ranche Companies.

Market Reports.

MONTREAL.

From Our Own Correspondent.

Feb. 25.—Although prices as a rule have kept very firm during the past two weeks, business has been very quiet, and very little lumber, and that only in a retail way, has been changing hands. Very little movement is looked for till the spring trade opens which will be about the middle of Mach. We have no report as to how things are progressing in the lumber regions. The weather has kept very cold and without much snow falling. We repeat our last quotations which are ex yard as follows :—

Pine, 1st quality, ⅌ M	$35 00@40 00

LIVERPOOL MARKETS.

The consumption of lumber during the month of January has been moderate. Spruce deals were sold by private bargain at £7 2s. 6d. and £7 5s., and by auction at £7 3s. 9d. to £7 5s. 3d., while some from Tetamagouche averaged only £6 17s. 6d The stock of Canadian lumber on hand for the month of January, 1883, with comparative figures for 1882 and 1881 was as follows :

	1881.	*1882.*	*1883.*
Quebec square pine	848,000	284,000	258,000
" waney "	812,000	318,000	245,000
Red Pine	60,000	30,000	58,000
Oak, Canadian & N. S.	500,000	337,000	304,000
Quebec deals	10,478	7,253	8,035

Wholesale quotations are as follows :—Quebec square white pine 1s. 7d. @ 2s. 5d. ; Quebec waney board pine 2s. 3d. @ 2s. 8d. ; St. John pine 18 inch average 1s. 10d. @ 2s. 4d. ; Quebec red pine 1s. 3d. @ 1s. 8d. ; Quebec oak 1st quality 2s. 10d. @ 3s. 2d. per cubic foot ; 1st quality Quebec pine deals £21 @ £22 per standard ; spruce boards £6 5s. @ £6 15s.

CORDWOOD

TORONTO.

From Our Own Correspondent.

Feb. 21.—Trade stands much about the same here as when I last wrote you. Owing to the continued severe weather building is at a complete stand still. The wholesale dealers, however, make no complants ; dealers from Manitoba have turned up here in formidable numbers during the past week, all seemingly in the best of spirits and evidently manifesting strong faith in the future of their adopted home, and the quantity of lumber likely to find its way there from the Georgian Bay, during the coming summer, will form no inconsiderable portion of the total manufacture in that locality. It is true some of the dealers from that western province are a trifle shy of purchasing at present prices, believing that the opening of navigation will see a fall from present values. My own impression is that in this respect they will not find their expectations realized, and, indeed, they may have to pay higher prices on the first day of May than those at present demanded ; and in support of this view I would point to the extreme difficulty now being experienced both in the lumbering states of Michigan and Minnesota, as well as north of this place, owing to the great depth of snow ; many operators indeed have entirely suspended work in the woods ; the horses in numerous instances being entirely used up, so that it is doubtful if the total crop of logs, west of the Ottawa lumbering regions, will sum up as heavy as that of last season.

Lath still continues extremely scarce and to advance in price ; and shingles have a slightly downward tendency, although the latter are still quoted at the yards at figures formerly given you :

BOSTON.

Cotton, Wool and Iron of Feb. 24, says :—The weather continues to average unfavourablo for both inside and outside building operations, especially the latter. There is, however, more or less inquiry for moderate amounts of lumber for repairs, and for the most necessary operations now in progress. New business is rather backward and cautious, but there are prospects for the starting of a good average amount of fresh building enterprises as soon as the weather becomes spring-like and somewhat settled. Indeed, a number of new contracts are already offering or have been placed. John W. Leatherbee & Co. have been awarded the contract for spruce for the city of Boston the coming year at $15.75 per thousand. Among the other new contracts in the city are a school building for the Institute of Technology ; a business block for the Ames estate, on Washington street, corner of West ; a large building corner of Pearl street and Atlantic avenue, and a large structure started at Hamilton place.

In soft woods there is no particular change in values, and the demand is quiet and moderate, with quite full stock at the railroads. Southern pine shows a rather better and firmer tone. The furniture factories are starting up lively, which will improve the demand for hardwoods, which are moving steadily for desirable stock.

CHICAGO.

The *Northwestern Lumberman* of Feb., 24, says :—The lumber business at large begins to give premonitory signs of the spring revival. Reports from the points of heavy supply in Michigan show that the buyers are beginning to feel around among stocks with a view to purchases. At Saginaw and Muskegon dealers begin to put in an appearance, and though transactions are not yet very numerous, the nature of the enquiries denote an intention to purchase at a not distant time. The number of the inquiries also indicate a heavy volume of trade when the season fairly opens. At Saginaw there is but slight disposition openly manifest to make concessions on anything but coarse stocks, yct little is known of the prices obtained, such transactions as have taken place being kept very quiet. At Muskegon as well as other manufacturing points in west Michigan, the holders of lumber seem to be indifferent to the general clamor about cheap lumber, and are generally holding stocks at last fall's prices. They meet enquiries with evasive answers, shrewdly concluding that questions put at this early period mean nothing more than a feeling around for information. The mill men over the lake appear to be simply holding their stocks for the spring demand, and do not mean to manifest any anxiety to sell before the demand fairly begins. It is likely, too, that considerable is hoped from the distributing trade movement that has been given a breeze at that point. The scheme at Manistee to combine in an agreement to limit the mill output, shows that the manufacturers intend to make a stand against the expected onslaught of the jobbers on prices. Other indications are at hand pointing to the same determination. Some jobbers in this city begin to doubt the future possibility of purchasing another stock very much cheaper than the one they now have on their foundations, and distrust the good policy of an over anxiety to sell what they have on hand at extremely weak prices. It is true that there is a disposition both in this city and on the Mississippi to scale down price-lists, some markets having taken that step already. The meeting that will be held by the trade in this city, February 27, will be one of great significance, for the tone then manifested in regard to prices will have a widespread effect. Though the Chicago price-list has fallen into disrepute under the influence of last year's defection in the ranks of the Exchange, and the cutting of prices that has prevailed, the markets of the Northwest still look to Chicago as the barometer of trade, for the reason that it is the heavier repository for lumber, and influences values throughout the country whatever may be the general opinion as to the integrity of the price-list. Throughout the Michigan producing region there is a present looking for indications, and in the meantime the holders of primary stocks are keeping quiet, with no disposition to force events. The wholesale trade in the Northwest is clearing its decks for the spring contest with values, and more or less concession to customers is the consequence of the jobbers desire to sell.

Trade is generally pickiug up in Illinois, Iowa and the west of the Missouri. In Ohio and Indiana it is somewhat hindered by the break in railroads, cansed by floods. In northern Wisconsin and Minnesota extreme winter weather still holds a firm grip, and trade is duller than in milder climes. At Winona, Minn., the price-list has been reduced 50 cents on common boards, from 50 cents to $1 on scantling, and from $1 to $3 on timber.

There is little change in the condition at the East. Trade is moderate at New York, while at Boston and New England points the indications are better, the demand having somewhat revived. A steady railroad demand at Albany is reported. Yellow pine at New York still maintains the slight improvement hitherto noted. The demand is increasing at Toledo, Ohio. There are enquiries at all markets, indicating a lively demand early in the spring.

The virtual settlement of the lumber tariff question by the refusal of the house of representatives to put lumber on the free list, has inspired manufacturers with more confidence than they felt when the matter was in doubt. They no feel that they have a basis for making a fight to maintain values, which no doubt has entered to their more recent determination to preserve a firm attitude.

Receipts, and stock on hand of lumber, shingles, etc., for the week ending Feb. 21, as reported by the Lumberman's Exchange :

RECEIPTS.

	Lumber.	*Shingles*
1883	1,396,000	2,524,000
1882	8,035,000	780,000

FROM JANUARY 1, 1883, TO FEBRUARY 21, 1883, INCLUSIVE.

RECEIPTS.

	Lumber.	*Shingles.*
1883	17,587,000	11,723,000
1882	40,176,000	9,890,000

GLASGOW.

The *Timber Trades Journal* of Feb. 10, says : The imports of wood to Clyde ports and also to Grangemouth from abroad during the past week have been extremely limited, consisting of parcels of staves and a few walnut and maple logs, etc. So far as the year has gone the additions to stocks have been few, the only full cargoes yet arrived consisting of teak timber, of which there were three cargoes imported last month. In the absence of pitch pine imports the consumption will speedily tell on the heavy stocks shown in the annual statement to be on hand. It is understood that not many vessels are offering for freights from Pensacola.

There are no public sales to report this week. At those that have been held since the beginning of the year—five in number—a disinclination to stock was shown by dealers, they having, it is said, a difficulty in obtaining a profit off consumers meantime, especially for the better descriptions of wood goods.

The market presently for birch, walnut, and mahogany is bare, and presents a favorable opportunity to importers.

LIVERPOOL.

The *Timber Trades Journal* of Feb. 10, says : There is apparently a little more life in our trade, although it is still in a languid condition : but as the imports of spruce deals and pitch pine, to which the supplies of this market are confined at this time of the year, are much below those usually made, there is every indication that prices, especially of the first-mentioned goods, will advance, seeing that the quantity held on importers' account is small, and that the engagement of tonnage so far is very limited. There is as yet no movement in pitch pine timber, and the majority of the merchants here appear to be disinclined to import until the present stock is materially reduced, notwithstanding the comparatively low prices that are being asked by the shippers.

There is more enquiry for oak cut into scantling suitable for wagon work, but without any material advance in price, and we may here remark that this descriptiou of goods holds a most anomalous position in the market, since prime selected wood cut to size is being sold at considerably less than the raw material. It is

difficult to see how this position of matters can continue in its present state, but for the present it would seem that buyers have the best of the market at the prices now going.

The only auction sale during the past week was Messrs. Farnworth & Jardine's sale of mahogany, &c., which took place on Friday, the result of which was not known until too late for publication in this issue.

TYNE.

The *Timber Trades Journal* of February 10, says :—The only arrivals of sawn goods to hand during the last seven days have been a parcel of staves from New York, and some small lots per Gothenburg steamers. With regard to the former, it is of interest to note the gradually extending importation of manufactured wood goods of every description from America ; not only doors, windows, &c., but staves ready to form into a barrel, and so packed that they can be immediately put together, are daily coming forward, and certain trades apparently have all they can do to hold their own in the race.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* says :—The rate of consumption in Great Britain is fairly satisfactory, and if exporters will but practise a policy of abstention for a month or so, such patience will doubtless be rewarded. Sawing for the season has, it is true, commenced earlier than usual at many of the mills, but this fact is more than neutralized by the circumstance that the rivers up the country are nearly clean of logs. I have already drawn the attention of importers to the latter point, and the danger it may involve if importers' stocks of Swedish goods are allowed to run low.

The letter which you published in your last issue from Quebec is very reassuring to all those interested in north of Europe whitewood, and holds out a legitimate hope that we may expect before long to see prices of these goods approximate more nearly to those of Swedish redwood. In the controversy which has been going on for some time in your columns, those interested in the spruce trade on the west coast of England seem to me to have given too little heed to the fact that a silent but effective natural law has been more responsible than the system of credit in causing the unsatisfactory result complained of. Importers in Liverpool have paid too much for their goods under pressure of a heavy demand from the home American markets, as compared to what they have been able to obtain in the inland markets of England in competition with Baltic goods. The great increase of population and wealth, taking and likely to take place in the United States and Canada, will, in my opinion, cause the spruce trade and the trade in other cheap woods from these countries to the west coast of England to diminish in volume. The east coast ports, notably Hull and Grimby, will probably not fail to benefit by what Liverpool loses in this respect.

Kippewa.

FEB. 13.—It is probable that the cut of timber and saw logs on the Kippewa will be somewhat larger this winter than last.

The number of shanties owned by the various lumbermen is as follows: Sherman, Lord & Hurdman, 2 ; Bryson Bros., 1 ; Edwards & Co., 2 ; Perley & Pattee, 2 ; Booth & Gordon, 2 ; Gilmour, 4 ; Latour, including jobbers, 5 ; David Moore, including jobbers, 4 ; A. Grant, 8 ; giving a total of 30. In addition to these Mr. Grant has about 7 or 8 more on his upper limits, but all this timber will be taken down by Temiscamingue. I only consider as Kippewa shanties, those in which timber or logs are made actually on the Kippewa itself or its tributaries.

The thermometer went down to forty below zero last Saturday, the 12th Feb.

Reciprocity.

A Canadian correspondent of the *Northwestern Lumberman* says :—There is scarcely any doubt but that the removal of the American duty (it being the first inflicted, therefore it should be the first removed) would lead also to the removal of all obstructions to the free entry of American lumber to Canadian markets. My case is summed up thus : It would be a thousand times better for the American manufacturers to agree to the termination of this duty on the condition that the Canadian government should also repeal the duty on American-made lumber. This would give to them an immense market in the western Canadian provinces, and, according to their own statements, they would bo as able to hold their own in the old markets as they ever have been.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Jan., and for the first month of the year :—

MONTH ENDED 31ST JAN., 1883.

Timber (Hewn).	*Quantity. Loads.*	*Value. £.*
Russia	566	691
Sweden and Norway	15,872	25,056
Germany	3,218	13,309
United States	2,542	10,829
British India	3,322	45,268
British North America	3,570	16,692
Other Countries	34,850	42,202
Total	63,940	154,047
Timber (Sawn or Split, Planed or Dressed).		
ussia	4,767	12,105
Sweden and Norway	24,041	60,633
British North America	27,058	63,355
Other Countries	5,489	22,073
Total	61,355	158,166
Staves, (all sizes)	2,315	15,876
Mahogany (tons)	1,683	17,638
Total of Hewn and Sawn	125,295	312,213

Gleaning Pine.

A local newspaper says that two farmers within two and a half miles of Ludington, Mich., have hauled to mill this winter 100,000 feet of pine, all secured from land that had been cut over before—that is, the big operators had skimmed the cream from it, and thought that what was left was of no account. But the two farmers, probably in clearing the land, picked up a little matter of 100,000 feet, which they sold for $7.50 a thousand, or an aggregate of $750. Probably after the great operators have "exhausted" the pine in Michigan, the farmers, small jobbers and pocket mill men will make themselves rich gleaning up the scattered pine, and furnishing the local supply for years to come. —*Northwestern Lumberman.*

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle,

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

CONSUMPTION
POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humhug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,
20L24 **360 Fulton Street, Brooklyn, N. Y.**

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O. ; W. EDGAR, Kilroy, P.O. ; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

C. NORSWORTHY & CO.,

HOW TO FIRE STEAM BOILERS.

Young engineers, if not some more experienced ones, will find some useful hints on a very important subject in the following article from the *Milling World*:

"By the application of a little skill and care, very unusal results may not unfrequently be attained by ingenious mechanics. This is especially the case with firing steam generators when the fuel used is salt or saw mill offal. Careless firemen fill the coal haphazard, as long as any can be got into the fire box, causing great volumes of dense, black, unconsumed smoke to issue from the stack, giving evidence to all who see it, and know anything about what is going on, that a large percentage of the fuel is being thrown broadcast into the air, not only wasting the money of the owner, and the labor of the fireman, but contaminating the atmosphere for the use and and enjoyment of the public.

Nothing would seem to be to be more plain than that it is the duty of the fireman, for his own sake, if not for that of his employers, to use as little fuel and labor as possible, to do his duty a little better than any one else. To effect this, only a little care, combined with such knowledge and skill as may easily be acquired by any fireman, is necessary. In burning coal, the grates should be much nearer the bottom of the boilers than in burning saw mill offal, the fire should be much more spread out, and kept shallower, and in feeding coal the lumps should be broken up to hickory nut size, and only a small quantity thrown on at once and well spread on, so that the flames may attack it on every side and thoroughly consume all the carbon and bitumen of which ordinary coal is composed. It is of vital importance that all the air needed to thoroughly burn the fuel up should be applied under the grate as directly as possible, and as hot as it can be made. Not a little of the waste in fuel is caused by too much air passing through the furnace in various ways, all of which consume heat in unnecessary quantity. The furnace walls should be as near airtight as possible, and no useless air should be allowed access except through the proper spaces, otherwise the draught is injured and much of the fuel is wasted.

The back ends of the grate bars ought to be several inches lower than the front, that the air going up to consume the fuel may not meet with so short a curve. It is also best, in many cases, to leave the ashes banked up in the back of the ash pit and at the sides, that the air currents may be concentrated into a steady stream, carefully avoiding all eddies. The best method for each separate furnace can only be ascertained by trial and experimental tests, which the fireman must make for himself, and which he will be sure to do if he wishes to excel in his business.

A fire room should always be kept closed up tight, be kept as hot as possible, and free from cold air currents and blasts. It is very poor economy to spend labor and fuel to make steam only to condense and lose it before it is used. The boilers ought to be completely covered with an air and heat tight casing. Formerly it was supposed that the boiler would be injured if the flames had access to the steam space in the upper part above the water, but this long ago been proved to be a great mistake. Where the boilers are fired inside, mineral wool covered over the exterior flagged with wood or metal is excellent as long as it is kept dry. A boiler thus covered can be touched by the hand without any unusual or uncomfortable heat being experienced. Even in warm climates, boilers ought always to be well protected under weather proof sheds or buildings covering up perfectly tight all the rear parts, even using a bulkhead or partition just at the front, outside of which the fireman may stand if the heat is too much for him. It must stand to reason that a boiler room cannot be made too hot, or kept so, for economy and efficiency. How to do so cheapest and easiest, is the problem which both employer and operator should unite in striving to attain.

Not long ago the writer saw a portable saw at a fair, that burned only 2¼ lb. of coal per horse power an hour. The coal was broken up chestnut size, screened and washed, and fed into the furnace a pound at a time, being carefully spread over the bed of glowing fuel in the fire box. No smoke could be seen issing from the stack, and the object, that of entirely consuming the fuel, seemed to be attained. But this is not practicable in ordinary use, though it may be approximated more nearly than it is, in almost every case.

The use of steam in very minute jets in front of the fire box inside may be made to contribute largely toward heating up furnaces and consuming smoke, when intelligently and skillfully used. But when applied in excess it dampens down a fire and does much more harm than good.

Water, it is well known, is composed of two highly combustible gases, oxygen and hydrogen. When steam is injected into a very hot fire, the water of which it is composed is decomposed, or separated into these gases, which add greatly to the heat of the furnace.

These suggestions are made largely for the attention of firemen and engineers, who can readily see what a margin for improvement is before them."—*Scientific American.*

AID OF MACHINERY TO LABOR.

Labor is a natural burden upon humanity; yet it is the key which unlocks the storehouse of wealth, convenience and luxury. By the use of invented and applied machinery muscular work is greatly relieved, and results cheaply and extensively obtained. In all this, however, intelligent skill is not supplanted; but rather there is a wider field created for the same, and more and more does it come into demand as the facilities for production multiply. Man, of course, may exist as our forefathers did, living in a rude and limited way on the necessaries of life, and even these secured only at the expense of oppressive toil; but as improvements are made, and varied and enlarged benefits flow therefrom, he rises in the scale of being, and the sphere of life is extended. The easy supply of wants in any direction only begets efforts in others; and as matters thus progress, instead of the demand for useful industry being diminished, there is more and more inducement to laborers to employ themselves with the exercise of every faculty.

It is a mistaken view, therefore, to imagine that there is the least tendency in the use of machinery to supersede the necessity of workmen, and take from them all opportunity to labor. Their skilful hands, discerning eyes, and intelligent brains are surely destined to find an ever widening field. Of course, the worker must not remain stationary, content to live and die an antiquated fossil, while all the world about him is changing and progressing. What he once did painfully and slowly with the hands alone he must now more abundantly accomplish through the agency of labor-saving devices and tools. Society has need of more production, and will only be satisfied with still more and more. With its prosperity and progress the laborer shares; and to-day he has more of the comforts and luxuries of life than were enjoyed by kings a hundred years ago. The prejudice against improvement, and the jealousy against capital and associations in their efforts to manage and direct production into more efficient and beneficial channels should disappear. As changes occur, old ruts should be promptly abandoned. By adapting himself to circumstances as they are thrust upon him, there is not a man who cannot succeed and find a market for his labor far beyond his ability to supply.—*Dubuque Trade Journal.*

THE U. S. MARKETS.

Saginaw, in one seuse, is the key to the lumber business in the country at large. It occupies a position midway between the prairie interior and the seaboard, and was from an early period the centre of the most important pine-producing region in the country. Though West Michigan, and its great market, Chicago, have of late years exceeded the Saginaw valley in producing and distributing capacity, the complexion of affairs at Saginaw points must still be counted on as paramountly significant of the true condition in the country at large, East and West, because of its relation to all the trade south and east, and to a certain extent to the westward. Hence it is, that when the report from Saginaw comes, as it does this week, that never since the panicky times of 1873 was there so little inquiry for lumber as now, it must be taken as a very important statement bearing on the present condition of the lumber trade. It shows conclusively that at the present time lumber merchants in all the territory tributary to the Saginaw sources of supply have all, or nearly all, the lumber they want. The reason of this apathy about further purchases is not hard to reach—an overstock all along the line, and an uncertainty concerning the future both in respect to the volume of next season's demand and the value of lumber.

When we seek corroborative evidence bearing on the same point from other sources outside of Saginaw, there is a striking unanimity. Wholesale dealers in this market have neglected the questiou of future supply all winter, their anxiety to sell what they have on hand overbearing all other considerations. At Albany, Buffalo, and minor eastern points, the same quietude is observable, and Mississippi markets are dormant. Undoubtedly the exceptionally severe winter and the snow blockades have intensified the sluggish condition, but that does not really put a better face on the matter, nor inspire any hope for the immediate future. Though there is an excessive stock being carried over this winter, if the cold season had been more favorable to building operations and the movement of lumber, a larger volume would have gone into consumption, and the stocks been more reduced than will now be the case. In all the large cities the excessive and long-continued inclement weather has nearly stopped building, and has thus very seriously reduced the yard trade.

This adverse condition, added to an overstock, has put the lumber trade into even a worse shape than the most hopeless individual feared early in the winter. The possibility of it was foreshadowed by the *Lumberman*, though the brighter view was also presented of the opposite extreme. But the seasons carry with them their effects in spite of hope or fear.

There are few lumberman sanguine enough at the present time to predict that prices in 1883 will equal those of 1882. It is now settled beyond a doubt that they will be scaled lower, but how much it remains for the opening spring to determine. As a matter of fact, values now are considerably below those prevailing last year at this time, when there was a veritable boom in demand, and prices were tending upward. The question now is as to whether they will fall materially lower, and how much, and as to where they will stop, and when become settled. In respect to these very serious matters to the trade every body at present is at sea.

Bearing on the general situation are the probabilities of the log crop and the early or late starting of the mills in the spring. The deep snows are seriously interfering with work in the woods, and it now seems likely that the output will not be as large as was first intended. This may prevent an overabundaut supply, as earlier in the season seemed probable. Besides, there is a prospect of a late opening of the streams, and a consequent late coming down of the logs and starting up of the mills. Navigation may also open late. If these maybes all become realities they will defer the opening of the re-supply season, so that if the demand for stock to go into consumption should be active as soon as the building season begins, the condition of oversupply may be somewhat modified. The *Lumberman* is not now making such a prediction, but only indicating what borders on the probability. In the present locked-up state of affairs this is about all that can be done.—*Northwestern Lumberman.*

Joinery for England.

The London *Timber Trades Journal* says:—With regard to the joinery trade, the business seems to be divided between the work done at home and the importations from Sweden and America, which goes on, side by side with fluctuations, America having apparently the biggest share.

Referring to a circular before us issued by a large American branch firm on this side, we observe that there has been a falling-off in the imports of ready-made doors, both from the United States and Sweden, to an extent that is corroborative of the dull trade of the past year, and to which we made special allusion in reviewing the importations of 1882 in last week's issue.

Dye from Poplar.

The young growth of the poplar tree yields a dye which may be extracted as follows: The young twigs and branches are bruised and boiled for twenty minutes with a solution of alum (ten pounds of wood requiring one pound of alum), in three gallons of water. The solution is filtered hot and allowed to cool, and after standing some time is again filtered from a resinous deposit. On exposure to air and light it develops a rich gold color, and may be used directly for dyeing orange and yellow shades upon all classes of goods.—*Buffalo Lumber World.*

A Soap Producing Tree.

In the temperate region of Southern Chili, of which it is a native, grows a tree which promises to be an acquisition to any country where it can be acclimated. It is called the quillai tree, and belongs to the botanical family Rosacea. It grows to a large size in the ravines of the spurs of the Andes and the coast range of hills. Its value is in its bark, which contains an alkali of extraordinary saponaceous virtue, and for washing and cleansing wool or silk has no equal as a detergent which thoroughly cleanses without injury.

FORTUNATELY Valvular disease of the heart is not very common, its disturbed action may be due to indigestion, liver irregularities &c. A Stomach disturbed with wind, or indigestable food will cause pain and fluttering by crowding on the nerves of the heart. Burdock Blood Bitters will speedily remedy all such difficulties.

WORTH KNOWING.—A Fact Worth Knowing. The best household remedy known for Coughs, Colds, Bronchitis, Asthma, Whooping Cough and all throat and chest troubles tending toward Pulmonary Consumption is Hagyard's Pectoral Balsam, to be procured of any druggist.

GOOD ADVICE.—If our readers will accept proffered advice, they will always keep a bottle of Hagyard's Yellow Oil at hand for use in emergencies, such as Burns, Scalds, Wounds, Lameness, Croup, Chilblains, Rheumatism and all varieties of aches, pains and inflammations. It will ever be found reliable.

MR. THOMAS W. RACE, Editor and Proprietor of the Mitchell *Recorder*, writes that he had a prejudice against Patent Medicines, but being induced to try Burdock Blood Bitters, for Billiousness that occasioned such violent headache and distress as to often disable him from work. The medicine gave him relief, and he now speaks of it in the most favorable terms.

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery, decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Proprietors, Toronto, Ont.

Chips.

A NEW YORK firm recently purchased fifty thousand feet of bird's eye maple timber in one of the northern Michigan counties.

THE *Northwestern Lumberman* says that nearly 200,000 hop-poles have crossed the St. Lawrence from Brockville to Norristown, N. Y., this winter.

THE Emerson *International* says that about 2,500,000 feet of timber will be floated down the Red River the coming season by Mr. McKay, of Morris, who has quite a force at work at his camp in Minnesota.

S. L. LANDERS, of Mt. Carmel, Ill., has made provision for his wife and children by planting 100,000 walnuts, which he expects will produce trees 15 inches in diameter in 20 years, and yield an independent fortune.

SMOKE will soon be at a premium. From 2,800,000 cubic feet of smoke given out by say 1,000 cords of wood, it is said that 12,000 pounds of acetate of lime, 200 gallons of alcohol, and 25 pounds of tar may be obtained,

PHILIP RITZ is fencing a 7,000-acre wheat field near Ritzville, W. T, There will be 12 miles of fence in all, requiring 50 car-loads of poles and cedar posts, which are being got out in the timber region of Pen d'Orielle lake.

AN Ottawa correspondent says that advices from the lumbering districts state that the winter has been a very favourable one for lumbering operations. Throughout the winter the snow always fell just in time to prevent the shanty roads getting worn.

THERE is some excitement among the Indians on Walpole Island, the report having been circulated that a recent timber sale was consummated by means of bribery. There were two bidders for the timber, and both claimed that the other party resorted to unlawful acts. Indian Agent Watson is investigating the affair.

THERE comes a muttered threatening of danger to the peace of Oka from Seminary sources. It appears that the Okas are cutting wood on the lands sold by the Sominary to the settlers, also that the Okas are in a starving condition, and that their temper is rising. Friends of the Okas say they have not heard of the threatened trouble.

THE Western Union Telegraph Company has estimated the durance of telegraph poles as follows:—Cedar, 16 years; chestnut, 13: juniper, 13; spruce 7 years. Cedar, chestnut, and spruce are used in the Northern States; juniper and cypress in the Southern States, and red wood in California. Poles cut in the summer will not last as long as those cut in the winter by five years. Soil and climate, of course, making a difference with the life of poles.

THE *Lumberman's Gazette* of Bay City, Michigan, says:—Senatorial action in refusing to place lumber on the free list will undoubtedly be instrumental in restoring confidence, settling values, and again opening up the avenues of business between the lumber manufacturing centres and the great eastern and western distributing points. Capitalists and laborers alike have reason to thank the Senate for this timely expression of interest in the manufacturing industries of the country.

IT is understood, says the Manistee, Mich., *Democrat*, that several large lumber dealers and capitalists from the East are making effort to purchase all of the uncut pine on the Ontonagon Grant, now owned by Milwaukee capitalists. The negotiating parties are the incorporators of the American Lumber Company, who have already purchased from the Detroit, Mackinac and Marquette Railroad Company the standing pine on its entire land grant, except, Mackinac county and the east part of Chippewa county.

THE making of charcoal is a considerable industry in Michigan along the line of the Flint & Pere Marquette railroad. Kilns are built of brick that will hold 40 cords of wood, and are filled twice a month. The product is shipped to Wyandotte, Detriot, Munro and Cleveland. Twenty pounds constitutes a bushel of charcoal, and a cord of wood will produce 40 bushels. Between Munro and Wayne there are 43 kilns; five at Stony Run, two at Otter lake and eight at Sears. The cost of the wood ranges from $1.30 to $1.75 per cord.

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and **Account Books** of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

Books taken out in parts, **Bibles, Works of Art, Illustrated Works, Music Books, Magazines, Perodicals** and **Newspapers** bound in any style desired.

Old Books, Albums, &c. Repaired and Rebound.

Maps, Pictures, &c. Mounted and Varnished.

Names Lettered in Gold Leaf on Presentation Books, Bibles, Purses, &c.

THREE FIRST PRIZES FOR BOOK-BINDING AT THE CENTRAL EXHIBITION.

FIRING WITH SAWDUST.

An engineer inquires about the prevention of smoke in using light fuels, sawdust, shaving, etc. If he has a return flue or tubular boiler, let him try a five or six inch pipe, one side drilled with ¼-inch holes, one inch apart, the pipe long enough to reach through the side walls and be flush with the same on either end; put this in just back of the bridge wall, say one foot, and some four or six inches below it, the holes on top. This arrangement will increase the flame and heat, and decrease the smoke. With a knowledge of the size of grate and velocity of draft, the size of the pipe could be got nearly correct. It is best to have it large enough, and if too large it can be partially closed. If a sectional boiler, have the walls of the furnace built double, with a space of four inches as long as the furnace, and as high as the bottom of the boiler. Connect this space with perforated plates. Be careful not to put them in directly opposite, as the object sought is to get a thorough mixture of the flame and air. If the air enters directly opposite, the tendency is to produce a straight flame, while if the air of one side enters back or forward of the opening on the opposite side, eddies are produced, and a more thorough mixing of the air and flame. An opening to the space should also be left from the outside. If a blower is handy, it would be a good idea to connect the air space with that and thus get greater velocity; but if a blower *is* used, a less number of holes should be used than with natural draft. The air space should be built so it could be cleaned, as one fault of the various patent settings is the stopping of air flues, and no way to clean them; or the cracking of the same and leaving an opening for air where it is not wanted. I know of a case where a party was getting wonderful results from a popular setting, with screenings and bituminous coal or fuel, but a boiler maker being called in to do some repairs on the boiler, the air flues were found to be entirely closed, and no way of cleaning them but to tear the whole arrangement down and build over again.—*Cotton, Wool and Iron.*

The U. S. Tariff.

The *Northwestern Lumberman* says:—Since it has become evident that the pending tariff bill will not place lumber on the free list, manufacturers breathe easier. After the Senate, in committee of the whole, adopted an amendment looking to the removal of duties on rough lumber, the manufacturers felt decidedly out of mental health. They took in the entire situation—big stocks on hand, a heavy log crop, a large number of new mills, and duty-free Canada lumber. The outlook was really gloomy. But now that the squall has blown over, the manufacturers do not disguise their elation. They are now planning the next season's campaign against the bearish jobbers in good earnest. The *Lumberman* is not surprised at the outcome. It all along was of the opinion that the least danger the manufacturers had to fear was from a deluge of free Canada lumber.

MONTREAL NOTES.

The *Gazette* says:—There is still a good enquiry for the leading descriptions of hardwood for the American market, but holders are not anxious sellers, and prices keep very firm. A fair local demand is likewise experienced for both hard and soft woods at last week's prices. Advices from Ottawa state that the prospects for the output of lumber are good, and that an unprecedentedly large crop of logs will be got out. Mr. J. Poupore, Crown timber agent, Ottawa, has issued a statement of revenue accrued in 1882 classified to revenue as now divided to Quebec, Ontario and the Dominion. It is as follows:—

	Quebec.	*Ontario.*	*Dominion*
Saw logs.....	$ 327,378 26	$189,769 54	None
Ground Rents	41,973 95	14,587 12	None
Booms	16,208 00	3,400 00	None
From Indian land's ground rents.....	.....	.....	$ 6,109
Timber dues..	116,208 00	3,400 00	None
Timber dues..	.....	.....	79,349
Slides and boom dues.	.....	.....	83,000 44
T'l Quebec.....			$ 363,315 30
T'l Ontario.....			2,043,380 76
T'l Dominion.....			83,854 93

U. S. Census Returns.

Western lumber papers insist that the census estimates of the amount of standing pine in the northwest are anything but correct, and poohpooh the idea that there is only a few years' supply on hand. Nevertheless, papers published in the heart of the lumber districts of Michigan daily report that certain specified mills and sections of the country have only from ten to twelve years supply. Mr. R. D. Mallet, of Luddington, Mich., was in the city during the carnival, after a trip through Mississippi. He reports that in the country contributing to Luddiugton, there is ouly enough standing pine for teu years cut at the present rate of production. Mr. Mallet is a large operator, and has travelled extensively through the forest regions of this country, and after careful examination, he has come to the conclusion that, so far as the Northwest is concerued, the census returns may be accepted as correct.—*American Lumberman.*

Prevention of Forest Fires.

QUEBEC, Feb. 24.—The following is Mr. Lynch's resolution respecting the means to be adopted for the more effectual preveution of forest fires:—"Resolved that it shall be lawful for the Commissioner of Crown Lands to employ between the 1st of April and the 1st of November, in any year, for the more effectual prevention of forest fires, such a number of men as he may deem necessary for that end, and he may, for any portion of the Province of Quebec, appoint an officer for that purpose who shall be kuown and designated as fire superintendent."

Hemlock Bark.

In the House of Commons on Monday, Feb. 26, in reply to Mr. Bergeron, Sir Leonard Tilley said the Government had under consideration a proposal to bring forward during the present session some measure regarding hemlock bark, in view of the fact that the United States House of Representatives had recently adopted a bill imposing a duty of 20 per cent. on the bark.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. "THE CANADA LUMBERMAN,"

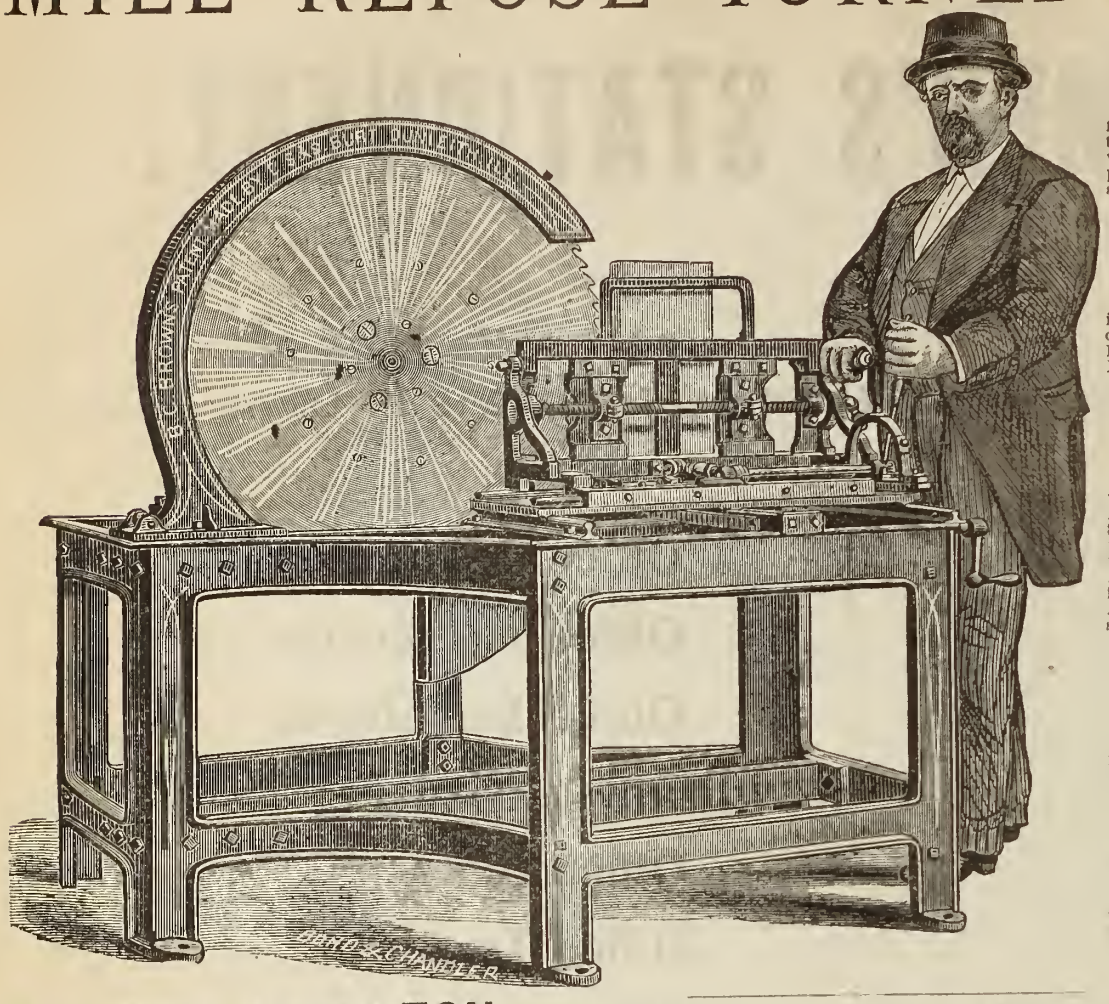
PETERBOROUGH, ONTARIO.

MILL REFUSE TURNED INTO MONEY



BY THE USE OF

Brown's Patent Spalt and Shingle Mill,

for making Shingles, Barrel Heading, Box Stuff, &c., from spalls, board trimmings, slabs, and mill waste generally, turning material otherwise worthless into valuable products. I have made arrangements with the patentee to manufacture and sell for the Dominion; have made and sold a good number of these machines which are giving excellent satisfaction and can give the best of references.

Our Steam Feed for Circular Mills,

is now the Best Feed where Steam is the motive power. It is easily operated, is simple, rapid, and seems never likely to wear out; sixteen 16 ft. boards, or eighteen 12 ft. boards, have been cut by it in one minute. It is the established feed for steam mills; I make a specialty of its manufacture; will guarantee satisfaction.

Our Patent Twin or Span Circular,

with Steam Feed for Steam Mills, and Rope or Rack Feed for Water Mills is fast coming into general estimation and is used in place of Gang Slabber in our best Canadian Mills. One of our Span Circulars which will slab logs 25 inches in diameter down to 7 and 8 inch stocks, will do the work of three slabbers, with an immense reduction in first cost, running expenses and labour. Two of these machines can be seen at work in Messrs. Gilmour & Co's Mill, Trenton, and Georgian Bay Lumber Co's Mill, Waubaushene and Port Severn. ☞I am also introducing a new style of Mill Engine, neat, substantial and simple, with Corliss Frame and Balanced Valve, all carefully designed and honestly made.

Covel's Automatic Saw Sharpener,

is now well-known and highly appreciated, when placed at work in the mill it sings out its own praise; I keep it constantly on hand, ready for immediate shipment.

Our Standard Circular & Gang Mills & Machinery,

are too well known to need any reference, any further than to say that I spare no pains or expense to have my work all first-class and give satisfaction, and as I make Heavy Saw Mill Machinery a specialty, any party wanting a First-class Mill will find it to their advantage to give me a call.

WILLIAM HAMILTON, Peterborough Foundry and Machine Works, **PETERBOROUGH Ont.**

EMERY WHEELS FOR SAW GUMMING.

EX INUTILI UTILITAS — TRADE TANITE MARK

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

September 28th, 1882. 1yL1S

THE CANADA LUMBERMAN

AND MILLERS' MANUFACTURERS' AND MINERS GAZETTE.

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

SUBSCRIPTION $2.00 PER ANNUM.

VOL. 3. PETERBOROUGH, ONT., MARCH 15, 1883. NO. 6.

A QUEBEC despatch says that Mr. P. Ouellet, of Levis, has purchased from the Bank of Montreal more than a million feet of timber belonging to the estate of the late Leandre Mohot, of Cap St. Ignace.

MR. VACHON has purchased all the lumber on the seignory owned by the Seminary of Quebec. Over one hundred men are engaged in cutting timber and building a dam on the Montmorenci river about half a mile above the natural steps.

INDIAN Superintendent Dingman has been making inquiries into the sale of timber on Walpole Island. One chief declares that he received $250 in cash and a promise of ten trees to snpport Mr. Tennant's contract, and a further sum of $100 to make an affidavit that the tenders were voted on honestly.

TIMBER, such as hickory, dogwood and persimmon, which a short time ago was almost worthless in North Carolina, is now in demand at $6 per cord, for sawing into blocks for the purpose of manufacturing them into power-loom shuttles. A factory for doing this has been started in Statesville, N. C., another at Elmwood, on the Western North Carolina Railroad, and still another at the Iredell Mills.

COTTONWOOD, like hemlock, a few years ago was regarded as almost worthless. It was principally used by raftsmen for buoying up cyprus logs, and found little or no market. Now it has come into extensive use in New Orleans and other southern cities, for the manufacture of packing boxes and is claimed to be the best wood in the world for that purpose. The milling price for seasoned lumber is $13 per thousand with prospect of an advance as the supply readily obtainable decreases. The *American Lumberman* thinks it highly probable that this wood will ultimately come into favor for ceiling and other inside work, as experiments in that line have proved very satisfactory.

A BILL has been introduced into Congress directing the withdrawal from the market of the fine government timber lands yet undisposed of, which are principally valuable for their timber, and the appointment of a sufficient number of examiners skilled in woodcraft to make an examination of the pine lands already surveyed, and report a full description of them, giving the quality of the soil, the springs and streams of water, the quality and quantity of pine and other matters tending to fix the value of the land. After the filing of the reports with the Secretary of the Interior, he is authorized to offer the lands for sale in the manner now prescribed by law, but the notice of sale shall contain a description by legal subdivisions, and the quality and merchantable value of the lands.

TO GROW FOREST TREES FROM SEED.

The following paper was read at the meeting of the American Forestry Congress at Montreal, by D. W. Beadle, of St. Catharines, Ont.:

It has occurred to me that there may be farmers who want to plant young trees, either for useful purposes or for ornamentation, and if they want to plant largely may find it impossible to get them in sufficient quantity from nurserymen, who generally confine their cultivation to fruit trees, and have not grown to any great extent forest trees for timber. But these parties can form a nursery of these trees themselves by procuring a small piece of ground and have it especially prepared and well manured, so that there will be strength in the soil for a few years, and then they can raise whatever kind of tree they want. Seeds of the elm, maple, ash and of the walnut and butternut can be found in almost any part of the Province. Thr important point in planting seeds is that they should be planted as soon as perfectly ripe. Some of our trees ripen their seeds quite early. The soft maples, the dasycarpum and rubrum and the elms, ripen their seeds in June. (Mr. Beadle here exhibited two seedlings of soft maple grown from this year's seeds.) These maples ripen their seed in June, and it should be gathered and sown at once so that you can get a tree of considerable growth before the winter season. The seed of the elms should also be sown at once; it should be sown in drills not deeply, but covered very lighly. These small seeds require to be covered with only sufficient earth to keep them moist, and they will produce plants in a very short time, and gain sufficient strength to tide over the cold season. But it is not true of all the maples that they ripen their seed so early in the season. The sugar maple ripens its seeds late in the autumn, as well as the ash-leaved maple, and unless you wish to sow them in the autumn, you have to preserve them and sow them in the spring. If you are not in a position to sow the seed at once, and wish to keep them till the next spring, they should be mixed with sandy soil and kept damp, yet not so damp as to cause them to germinate, and not be allowed to get dry. In this way you may preserve them with safty. If kept dry in papers some of them will have vitality the following spring, but many of them will not germinate next season, and the proper way to preserve them is to mix them with moist earth. Now come the butternuts, chestnuts, and walnuts; these all ripen in the late autumn, and in suitable soils may be planted as soon as gathered, and allowed to freeze and thaw with impunity, as they will not suffer therefrom, but will germinate freely in the spring. But in soils which heave out the nuts under the effect of alternate freezing and thawing, it will be better to mix the seeds with soil in sufficient quantity to keep them moist, and prevent them from moulding, and keep them until spring before planting, or they may be spread out very thin upon the ground, and covered with a sod, in which manner they will keep fresh. It is not necessary that the nuts be subjected to frost, that is a matter of perfect indifference; the important thing is not to permit them to become dry. These trees can be grown in nursery fashion, until they attain sufficient size to be planted where they are to remain, especially the elms, maples and ashes. The nut-bearing trees will make better growth if they be planted in the nut where they are to remain.

FAR WESTERN PROGRESS.

One of the most noteworthy examples of current progress is the opening up of Idaho, Montana, Oregon and Washington by railway construction. The remote regions of the Rocky mountains in Idaho and Montana, as well as eastern Oregon and Washington, hitherto inaccesssible save by means of the slow-plodding mule and the long-suffering horse, will soon reverberate with the shrill locomotive whistle and the thundering train. The vast regions thus opening to traffic are mostly without adequate timber resources, and as their mining and stock-grazing interests are developed, and towns and cities spring up, a field of lumber distribution as large as that now tributary to Chicago will be added to that which is calling on the supply.

All are familiar with the building of the Northern Pacific, which now lacks only 200 miles of completion, and will sweep across the northern part of the mountain region. The Union Pacific company is pulling out to reach Oregon and Washington aoreast of its great northern rival. It is constructing the Oregon Short Line, which leaves the main line at Granger, Wyoming, and strikes off through Idaho in a generally northwest direction toward Oregon, and is intended to connect with the Oregon system at, or fifty miles east of, Baker City. The road will be opened to Shoshoue, Idaho, on March 1, a distance of 321 miles from Granger. Shoshone is at the junction of the Wood river branch, which extends northward. The Short Line not only will connect with the Oregon system, but is striviug after Puget Sound business and this interest is spurring the Northern Pacific company to put in the projected road across the Cascade range from its trunk line to a Puget Sound outlet. Not only are these two great rival trans-coutinental companies thus reaching and straining after north Pacific traffic, but it is said that the Chicago & Northwestern company is stretching for the Pacific through a region midway between the lines of the Union Pacific and Northern Pacific, and will soon have a road completed to Deadwood, in the Black Hills. Further progress westward across the Rockies is only a question of time. These three great trunk lines will quite thoroughly open up the regions of Idaho and Montana, and each is sure to throw out branches as the two that have already penetrated the country have begun to do. It is safe to say that, within three to five years, Idaho, Montana, eastern Oregon and Washington will be as well supplied with railroads as Iowa and Minnesota now are. This, of course, means settlement, hundreds of new towns and cities, and the use of any amount of lumber.

The territory in question will derive a large part of its lumber supplies from the growths in the mountains of Montana around Lake Pend D'Oreille, the western slope of the Rockies, and on Puget Sound; but these sources of supply will not be nearly adequate to supply the demand. The white pine of the regions of the great lakes will furnish a kind of lumber that will be wanted in the mountain states and territories, and the supply will be drawn upon as long as it shall last.—*Northwestern Lumberman.*

THE NORTHWESTERN TRADE.

We learn from the *Northwestern Lumberman's* report of the proceedings at the monthly meeting of the Chicago Lumbermen's Exchange that the president called upon Major Camp, of Camp & Walker, Minneapolis, Minn., to address the meeting. After a few complimentary remarks, by way of sugar-coating a bitter pill he was rolling up for them, he launched the opinion that the prospects were that trade in the northwest would not be as good as it was last year. They should cut the same amount of logs that was cut last year, but they went in for more. Providence had kindly stepped in and saved them from the foolishness they had intended (meaning the intervention of deep snow and extremely cold weather). The demand in Dakota and Manitoba will not be as great as it was a year ago, and the prospect was a little discouraging. Yet they were working along and maintaining prices. He could say for the firm of Camp & Walker that it had not sold a foot of lumber yet below list prices. When they should find that their prices were above the market, they would reduce their figures and issue a new list. The trade of Chicago and the Minneapolis district the coming year would have to meet a heavy competition. There would be a heavy increase of production in northern Wisconsin, fully 200,000,000 feet, on account of uumerous new mills having been put in. Chicago will uot get a chance to ship to Manitoba, as it did last year, because he (Camp) would prevent it if possible. The dealers of his section would also crawl dowu iuto Iowa and Nebraska, and in those fields try to work off some of their surplus. This talk might not he palatable and eucouraging to some of the dealers present, but it was nevertheless true. When Mr. Camp had done speaking, the president adjourned the meeting.

QUEBEC FORESTS.

The Montreal *Gazette* says :—There are some interesting features in the last report of the Commissioner of Crown Lands of this Province with which some of our readers will be glad to be made acquainted. The result of the financial transactions of the Department for the year 1881-1882 is highly satisfactory. The amount realized from the sale of Crown Lands, Clergy Reserves, Gold Mines, Woods and Forests, and other resources, together with certain fees and deposits, attain a total of $818,283.11, an increase of $148,994.85 over the receipts of the preceding year. On operations so favorable it fell to the lot of no previous Commissioner since Confederation to report. They took place during the tenure of office of the Honorable Mr. Lynch's predecessor, and it is to be hoped that the satisfactory state of things which he has had the pleasure of announcing will go on improving (as they have begun) under his own administration. This large income was mainly derived from the sale of Crown Lands and, more especially, from the collections on account of woods and forests. Tho increase of ordinary revenue from timber dues and ground rents was $230,930.63. Of this sum the greater part arose from the additional dues imposed by the order in Council of November 12, 1880. The beneficial effect of this order began to be apparent during the last fiscal year and to what extent it is likely to affect the future receipts of the Department may be gathered from the statement that from the branch of woods and forests the figures for the last six months were $600,000. A sale of timber limits of comparatively small extent in October, 1880, produced $26,921, and though, greatly exceeded by a previous sale in the fall of 1880, which brought the handsome amount of $132,774, its success, with other indications, gives reasons to hope for good returns hereafter from this source of revenue. The limits thus leased by auction coveriug an area of 715 miles, situated for the most part in the eastern portion of the province (in the counties of Montmagny, Rimouski, Bonaventure and Chicoutimi), brought to the treasury an average bonus of $36.58 per square mile. This is more than double what has been hitherto obtained for limits of similar situation.

The Commissioner recognizes the obligation that presses on the Governmont, in view of the rapid denudation of timber areas in Canada, as well as elsewhere on this continent, of taking measures for the preservation, by judicious working, and, where possiblo, for the renewal of our forests. Mention is made of the evidence that the persons most concerned by business and associations in that branch of economy have taken the matter into earnest consideration, and have seen at last the expedieney of atoning, as far as practicable for the waste and neglect of the past. In this connection the Forestry Congress, which met in this city in August last, was an event of no slight importanee, as significant of a determined purpose to utilize experience and combine effort in that direction. Of the good influence of the Congress, tho recommendatien of the Commissioner to adopt its resolutions, as far as circumstances permit, is itself a proof. The Hon. Mr. Lynch gives a pithy interpretation of one of the most important of the resolutions, whose force he acknowledges as a neutralizing of so-called colonizing movements, whose real object is the pillaging of our forests. To effect that object, to distinguish between land that is fit only for forest-bearing and land that may be advantageously cultivated, he points out that it is necessary to have minute and detailed inspections of our vacant lands, and he promises that those already commenced (to ascertain the manner and extent in which survoying operations should be carried on) shall be prosecuted with renewed vigor. He is already able, he adds, through the sustained conscientious inspection of Mr. Joseph Bureau, Forest-ranger, to exercise control over all the region between the Du Lievre in the west, and the line dividing Ottawa and Argenteuil counties in the east, and from the 46th parallel towards the south to the limit of Ottawa County in the north-west. As to forest fires (tho prevention of which formed the subject of the other recommendation of the Congress) Mr, Lynch is of opinion that, in addition to existing legislation, measures more energetic than any hitherto adopted must be undertaken, if the law is to be, as in the past, more than a dead letter. It is satisfactory to know that Mr. Lynch has held conferences with some of the chief lumber merchants, who are owners of limits and equally interested with the Government in the preservation of the forests from destruetion, for the purpose of arriving at some plan of comnion action. It is to be hoped that the result will be such a system of supervision as will prove efficacious. Of course, if the organization approved of should turn out to be futile as an agency of fire-protection, there would be no use in wasting money on it. But, on the other hand, if it is possible to apply protective measures on a plan and scale which would prove largely preventive of such holocausts as have ravaged our forests in past years, the expense would be a trifle, compared with the good accomplished. At any rate, it is well to know that the Commissioner is directing his known capacity and energy to the object in question and, with all who are interested in the safe-keeping of our forests, we trust that his efforts will be successful.

ELM BARREL HOOPS.

Tho *Lumberman's Gazette* of Bay City, Michigan, says :—The manufacture of barrel hoops from olm timber dates back some 20 yoars. The pioneer in this new industry received the usual encouragement that was meted to inventors, who were in advance of the masses. The now hoop (made by a machine) was regarded with distrust, and those few who engaged in its manufacture were considered foolhardy and and only a few removes from a lunatic asylum.

The drummer of those days who attempted to place the hoops was no sinecure. He was the inventor and manufacturer as well, and his reception on the market may be imagined, when few hoop dealers would take them as a gift. However, continued perseverance and enterprise, guided by a seeming prophetic vision of the necessary wants of the near future has won, and we see in the elm hoop of to-day, one of the most important staples of the country.

The first conception of the manufacturer of olm hoops was to saw the logs into planks of the required thickness to make the hoop the required width, then by cutting from the edge of the plank into strips, the necessary thickness required for hoops.

This seemed to be tho only way that could be devised, and all the new and improved hoop machinery that were subsequently invented arrived at the original result. The log had to be cut into plank, increasing labor and cost, and decreasing value and quality by making two-thirds of the hoops bastard. With all these attending difficulties and imperfections the hoop has steadily grown in favor and the consumption is rapidly increasing.

Two years ago F. L. Wilson realizing the importance of the cut hoop and noting the growing local demand in the Saginaw Valley, conceived the idea of cutting hoops direct from the log, adapting the machine to the natural growth of the timber, and not the timber to the machine, uniformly converting the log into perfect legitimate (not bastard) hoops without the aid of saws, and so well has he succeeded that to-day may be seen at the Wilson Hoop Company's works, West Bay City, the most perfect automatic hoop cutting machine in the World.

The mechanical construction of this machine has no complicated parts to get out of order, and considering the unerring work it performs makes it one of the wonders of ingenuity, simplicity and durability.

The motor is a 10x18 engine—directly attached—no belts used.

The feed is automatic and consists of two distinct motions, viz: A rotatory, revolving the log on its axis which produces the thickness of the hoop; a horizontal, moving the log on horizontal ways by means of racks and pinions on a plan with its axis which produces the width of the hoop.

The feed of mechanism is so perfect in construction and accurate in action, the thickness of the hoop can be varied at will the one-hundredth part of an inch.

The logs are cut the required length and placed in large vats, where they are steamed from 36 to 48 hours. The bark is then easily removed before being placed in the machine. Then, after being firmly clogged, the log commences to revolve, and the hoops are removed one by one, at the rate of 90 per minute. When the log has been reduced to a given diameter it ceases to cut, and the spalt, or heart, is replaced by another. This change of logs only requires 30 seconds time. Although elm hoops have been used for a number of years, their strength and durability has never been demonstrated to such an extent as to give them a place and preference over the split or racked hoops until this system of cutting direct from the log was perfected, giving to each and every hoop uniformity of width, thickness and grain. The use of these hoops is no longer an experiment but has been fully tested, not only scientifically and theoretically, but practically by scores of our best coopers and business men throughout the valley.

This newly developed industry gives employment to upward of thirty hands, eight girls are included in this number, who find tho work agreeable and give reasonable satisfaction.

Business has been prosecuted by the company with unusual vigor and energy during the winter months, and they have now on hand a large stock from which to draw during the coming salt-packing season.

They have also secured in their boom and on the bay shore sufficient timber to enable them to supply customers throughout the year to come.

This industry has opened up to the farmers of this valley a new source of revenue—the timber that for years has been consigned to ashes in the log heap. As civilization and improvements have advanced, it has suddenly been discovered to have a value, and a ready market, giving to them a chance to contribute something more towards the wealth and prosperity of themselves and their surroundings.

This invention is a credit to the city as well as a permanent and lasting reality, the product filling a long felt need. The enterprise should be encouraged, and to that end we urge our patrons who use barrel hoop to examine for themselves.

FOREST CULTURE.

In view of the immense consumption of lumber in the United States and the rapid annihilation of the great forests, the importance of growing timber wherever it may be done advantageously cannot be too strongly emphasized. To many the first attempts at growing trees is often discouraging, and they give it up as an unprofitable business. This is especially true on the prairies, where the young trees are exposed to the full weight of the winds which sweep over them, bending, breaking and dwarfing them. Another difficulty in the west is that fencing is expensive, and too often the land set apart for growing trees is not as well protected as it ought to be from the destructive feet of cattle, which do more damage by breaking down the trees and cropping the foliage than is done by the winds. One hungry steer in a very young forest will do more injury than a full-grown hurricane. Many are too economical of their seed, fearing that they will get the trees too thick. There is not much to be feared on that score. The closer the trees are the better; the strong will make room for themselves by killing and feeding upon the weaker whenever the later are no longer of any service as shields to the bodies of the strong against heat and cold, men, beasts, insects and other foes. All the forces of nature will contribute to the "survival of the fittest."

One great mistake, especially in the prairie states, is that of appropriating the bits of timber land, after the timber on them is cut off, for agricultural purposes. If these "clearings" are let alone after the old timber is cut and removed, a new growth will spring up which will develop much more rapidly than any hand planted forest, and the second growth will be better than the first. We have seen in Kansas dense growths of young hickories, which in six to ten years after the original timber was cut, would be from thirty to forty feet high, the bodies long and straight and from six to eight, often ten, inches in diameter one foot from the ground. These young forests would produce per acre many cords of stove wood, for which they would almost invariably be cut—the owners considering the present needs of more importance to them than any investments for their children, if perchance they had any of their own to provide for.

Perhaps it is not worth while to urge upon the railroad companies the advantages that might accrue to them from scattering walnuts, acorns and seeds of other forest trees on their land bordering their tracks. The stockholders rely more largely upon the net earnings of the roads to boost the quotations of their stock on Wall Street than upon the present or prospective intrinsic value of their plant. Neverthless, there is a speculation in this suggestion of more value than may at first sight appear. The time is coming and is not far distant when wooden ties will be comparatively scarce and expensive, and iron will be worth much more per ton when the supply of wood is exhausted. The seed may now be readily secured; when the trees are consumed the supply of seed is destroyed. While it is still possible to get the seed it ought to be used. In fifteen or twenty years almost every railroad in America might have all the timber it would need to replace decayed and decaying ties. The benefits of such belts of timber would be manifold, and no more useful than ornamental. The interlacing roots would prevent the washing of the soil into cuts; the branches would afford windbreaks and shade; they would increase the moisture and check the sparks from locomotives which in dry seasons consume the fences and pastures of the farmers. Of course there would be some dangers to guard against, such as result from the accumulations of dry leaves and falling trees, but such contingencies are slight compared with the advantages to be secured.—*The Industrial Monitor.*

HOW TO TAKE OUT SCREWS FROM WOODWORK.

The following practical hints on this subject are from a long article in the London *Builder* on "The Use and Abuse of Screws in Woodwork," and may save our readers much vexatious effort, not to say profanity, in the extraction of old and obstinate screws :—

A difficulty is often experienced by persons who wish to withdraw a screw, by finding that though it will turn round under the application of the screw-driver, yet it will not unscrew out. In this case a well-grounded suspicion may be entertained that the screw in question was driven, or nearly driven, home originally by the hammer, instead of gradually by the screw-driver, and that no regular thread corresponding with the screw exists in the wood. Under such circumstances it becomes necessary to wrench off the hinge or hinges by force, at the risk of their breaking, and this often happens. When hinges have lain undisturbed for long years on old doors or other framings, perhaps for a quarter of a century or double that time, it becomes difficult to extract the screws, although they may have been originally properly driven. This arises from the screws rusting in the wood, and sometimes from other causes. Workmen themselves often fail to withdraw a screw, and are forced to break the hinge to enable them to get under the head of the screw, and wrench it out. They often split, and break too, fancy and delicate wood-work articles, in their efforts to take off hinges, locks, mountings, and other finishings, despite that simple methods exist for extracting screws that have rusted in the wood. One of the most simple and readiest methods for loosening a rusted screw is to apply heat to the head of the screw. A small bar or rod of iron, flat at the end, if reddened in the fire and applied for a couple or three minutes to the head of the rusted screw, will, as soon as it heats the screw, render its withdrawal as easy by the screw-driver as if it was only a recently inserted screw. As there is a kitchen poker in every house, that instrument, if heated at its extremity, and applied for a few minutes to the head of the screw or screws, will do the required work of loosening, and an ordinary screw-driver will do the rest, without causing the least damage, trouble, or vexation of spirit. In all work above the common kind, where it is necessary to use screws, and particularly in hinge work and mountings, fancy fastenings and

appliances affixed to joinery or furniture work, we would advise the oiling of screws or the dipping their points in grease before driving them. This will render them more easy to drive and also to withdraw, and it will undoubtedly retard for a longer time the action of rusting.

THE NEW FOREST OF ENGLAND.

The London correspondent of the Detroit *Free Press* says :—The American reader will be somewhat surprised to learn that within a comparatively easy distance of London there is a forest extending over twenty-three miles of country in one direction and eighteen miles in another and that 92,000 acres of it are the property of the British Crown.

Arrived at Ringwood the traveller will see much inferior soil, but the wild character of the country does not seem to reach its climax until after he enters the forest boundary, two miles beyond the above-named place, and then the wilderness begins to spread and oxpand on every side.

Sometimes no houses are seen for miles, save here and there a mud-wall cottage, and in the distance the cotter's pony and the cotter's cows wandering among the herbage and wearing each a color with a bell. Here it may be incidently stated that the ancient forest rights which permits cattle and horses to run upon the common have made no provision for sheep, perhaps because it was a run for deer.

As the train whirls the traveller on he sees a troop of shaggy ponies wandering about in the vain hope, as it seems, of finding something to eat. Hundreds of ponies may there be found who have reached old age and never did any work except the dreadful drudgery of being compelled to move constantly about in the often vain hope of finding something which they could eat. In some parts there is nothing to prevent them from strolling many miles—and they do so wander frequently—their owners seldom looking after them in the summer months. In situations where the horses are so very poor there are no neat cattle. They cannot live upon such scanty fare.

The commons generally cannot be said to be wanting in fertility, but in the swamps rushes does not even grow to more than half the average height, while gorse and the native heather are short in stature and grass in many parts positively a scarce commodity. Some of the most elevated parts are wilderness of sand and gravel, discolored by scrubby herbage for which the average dairy farmer would be unable to find a name. But within this wide, outlying range of desert there are some lovely spots, and heightened by contrast, the really beautiful appears more beautiful still.

It is upon these cases the forest villages are built, and are generally neat and pretty, with good soil, good water, and good roads, and almost hidden with foliage and flowers. The 'Squires' country seats are found there, it being a favorite sporting district and celebrated for fox-hunting. Not many years since 10,000 head of dear, the property of the Crown, ran wild over the desert, and every person ate venison ; but the deer are all destroyed now, principally to put an end to poaching and its attendant evils.

The forest at one period was much neglected; squatters settled on its borders and acquired possessions which they held almost as freeholds ; and when timber was required timber was had. No care was taken, and much fine timber was lost to the nation. Now all is changed ; hundreds of acres at a time are fenced in and planted, and much of the best land is bearing thriving plantations of oak and fir. In many parts the fir trees are exceedingly fine ; seldom are they found elsewhere so tall, so straight, and so clean in the bark. Very valuable to the British nation will the timber-bearing portion of the forest ultimately be. Not many, if any, decaying trees are now there, and in the parts not recently planted are many fine ones which will grow and thrive for many years to come. A visit to such historic ground as the New Forest would well repay the traveller in quest of health and picturesque scenery.

The *Trent Valley Advocate* says that Messrs. Gilmour & Co., intend establishing a large lumber yard at Napanee.

FOREST PROTECTION IN QUEBEC.

Hon. Mr. Lynch in the Quebec Legislative Assembly on March 8, moved that it shall be lawful for the Commissioner of Crown Lands to employ, between the 1st of April and the 1st of November in any year, for the more effectual prevention of forest fires, such a number of men as he may deem necessary for that end, and he may, for any portion of the Province of Quebec, appoint an officer for that purpose, who shall be known and designated as the "fire superintendent." In support he made a very powerful speech, referring to the recommendation of the Forestry Congress, to the message of President Arthur of the United States, to the opinions of Mr. Russel and of Professor Sargeant, and to many other corroborative evidences of the necessity of protecting our forests against their great scourge, fire. He referred to the diminution in the supply of white pine, and felt sure that the limit-holders, who were equally interested with the Government in the protection of our forests, would willingly consent to a small imposition for the purpose of securing this desirable supervision. He alluded to the law now in force in Ontario concerning forest protection, and spoke of the desirable manner in which it had worked. He did not know whether, if the system had been in vogue in this province, it would have succeeded in preventing the large conflagrations which we have experienced, but he looked forward in the future to the establishment of a body of well trained men, who would, at all events, be instrumental in preventing fires heretofore caused by carelessness or negligence. He would be glad of any suggestion from members of the House which would make his measure more practical, and desired particularly that the Legislature should assert the principle of adopting an effectual means, by means of no large outlay, of forest protection against fire. [Applause.]

Mr. Joly warmly supported the resolution, adding the hope that the Government would appoint as superintendents honest and useful men, and not parties recommended to their favour for political reasons, and offering a large number of practical suggestions, especially with regard to railways running through forest lands.

Mr. CARBRAY said the Government could not take too much interest in the protection of the forests. Within the last twenty-five years it was probable that more timber had been destroyed by fire in the province than had been cut for the market. He had heard, only to-day, a lumberman complaining of the laxity of the rules of the Crown Lands Department with reference to the cutting of trees measuring less than twelve inches at the stump. After the Dominion subsidy, our forests now supplied almost our only source of revenue, and he could not recommend too strongly to the hon. Commissioner of Crown Lands the great importance of taking means for their preservation, and to render effectual the present regulations of the Department affecting them. He was sure no member of the House would begrudge a reasonable amount to be set apart for this purpose from the revenue derived from our Crown lands. [Applause.]

Mr. Flynn followed, expressing the pleasure with which he had heard the remarks which had fallen on this subject, both from the hon. Commissioner of Crown Lands and also from the hon. ex-leader of the Opposition. He spoke at some length in favor of the resolution.

Mr. Beaubien also supported the resolution, suggesting, amongst other things, that the guardians who should be appointed might be employed in seeding down such portions of the bush as had been swept by fire, and were unfit for cultivation, and instancing trees now thirty feet in height, the seed of which he himself had planted. He also spoke of the waste occasioned by the manufacture of square timber, speaking at considerable length.

Mr. Marchand made some lengthy remarks in favour of the resolution.

THE U. S. FAR NORTHWEST.

Practically, the whole country between the Minnesota prairies and the Rocky mountains is bare of timber. There are little strips of forest trees along the water-courses in Dakota, but they consist mainly of cottonwood, soft maple and alder, and furnish only a scanty supply of fuel to the settlers, and are of no valuo as a source of building material. West of the Missouri there is nothing worth sawing up into lumber until the advanced spurs of the Rockies are reached—the Big Horn, the Belt, the Judith, the Big Snowy and the Yellowstone mountains. In the gorges running up their sides there is sufficient "bull pine" and spruce for the settlers' purposes and for railway ties and bridge timbers, but there are no large, well-timbered areas. On both sides of the main divide of the Rockies about the same condition is found. The pines are somewhat larger, and some cedar is met. For want of something better, the timber is of great value for local consumption, for fuel and building purposes in the neighboring valleys, but this is all that can be said of it. Not until I reached Clark's Fork of the Columbia, or the Pend d'Oreille, as it is known to the settlers, did I see any extensive body of good timber. On both sides of that stream, between she Cœur d'Alene and Cabinet mountains, lies a heavily-timbered belt of about one hundred miles in length by thirty in width, reaching down to and around Pend O'reille Lake. The trees are "bull pine," cedar, hemlock and spruce, with a little white pine. The western slopes of the Cœur d'Alene mountains and the Bitter Root mountains, which are a continuation of the same range, are moderately well timbered and furnish material for fuel, fences and buildings for a wide stretch of rich, bare country farther west. From these mountains, westward to the narrow valleys running up into the Cascade range, the country is nearly destitute of forest growth. A few stunted pines grow on the sides of the deep, narrow valleys through which the streams run. Along the lower course of the Columbia and around Puget Sound there are immense forests of fir, furnishing a practically inexhaustible lumber supply. Eastern Washington, fast becoming a great wheat-field, feels most the lack of forests. Western Oregon, including the fertile, well-settled Williamette valley, is well supplied from both the coast and Cascade mountains, while western Washington is all a vast forest, where the clearings are mere specks upon the immense expanse of woodland. This magnificent forest is destined to be a source of great wealth for centuries to come. The lumbering operations up to this time, although very extensive, have only notched it here and there at long intervals close to the water-side.—*E. V. Smalley, in the Century for February.*

REPLACING WHITE PINE.

The Chicago *Times* says :—One noteworthy fact in the lumber business of Chicago is the annual increase in the supply ot the Gulf states. By many it is claimed that this lumber will be the immediate successor of white pine in western markets, should the latter cease as soon as expected. At this time, however, the cost of transportation does not allow large shipments of southern lumber, and long timber and dressed flooring are the only grades of yellow pine sold in Chicago. The latter, being dressed before shipping, is greatly reduced in weight, and the current prices afford a satisfactory profit. Enough lumber has already been received from the south to remove any fear of a lumber famine in this city for many years, as, if it can pay present rate of freight, it will come naturally to a large market, when the south has more railway competition, which increasing wealth and enterprise are sure to supply.

Letter from Member of Congress.

HOUSE OF REPRESENTASIVES,
Washington, D.C., Feb. 19, '82.

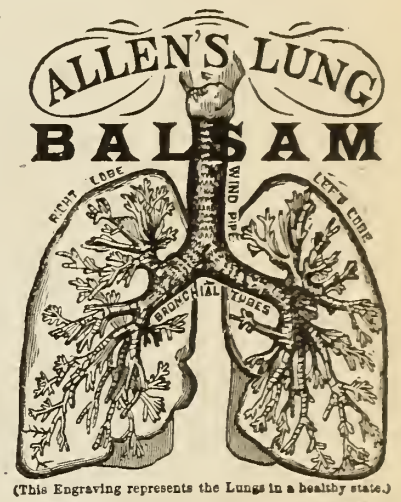
GENTLEMEN,—Inclosed find $1, and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a bad cold, as has almost every one else here, but cannot find the Elixir, which I used frequently at home and consider a most valuable medicine ; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GROUT.

GOOD ADVICE.—If our readers will accept poffered advice, they will always keep a bottle of Hagyard's Yellow Oil at hand for use in emergencies, such as Burns, Scalds, Wounds, Lameness, Croup, Chilblains, Rheumatism and all varieties of aches, pains and inflammations. It will ever be found reliable,

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery, decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars ; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto



(This Engraving represents the Lungs in a healthy state.)

THE WAY IT WILL AFFECT YOU.

It excites expectoration and causes the lungs to throw off the phlegm or mucous; *changes the secretions and purifies the blood;* heals the irritated parts; gives strength to the digestive organs; brings the liver to its proper action, and imparts strength to the whole system. SUCH IS THE IMMEDIATE AND SATISFACTORY EFFECT that *it is warranted to break up the most distressing cough in a few hours time,* if not of too long standing. *It is warranted* TO GIVE ENTIRE SATISFACTION, EVEN IN THE *most confirmed cases of Consumption! It is warranted not* to produce costiveness (which is the case with most remedies), or affect the head, as it contains no opium in any form. *It is warranted to be perfectly harmless* to the most delicate child, although it is an active and powerful remedy for restoring the system. *There is no real necessity for so many deaths by Consumption,* when ALLEN'S LUNG BALSAM will prevent it if only taken in time. Physicians having consumptive patients, and who, having failed to cure them with their own medicine, we would recommend to give ALLEN'S LUNG BALSAM a trial. *Sold by all Druggists.*

PERRY DAVIS'
VEGETABLE
PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burus, Scalds, Old Sores and Sprains, Swellings of the Joiuts, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

HEAD BLOCKS, ETC.

The head blocks must be accurate and durable, and move easily and rapidly. They should be small in construction, and of strong material well put together. For general purposes, setting to 1-16 of an inch is close enough, but in some cases they are needed to set 1-32 of an inch, as in making 1 1-16 inch boards with ¼-inch saw kerf, as in this case if the blocks set to 1 1-16 only, the sawyer would have to leave the lever at the 1 1-16 inch pin every other throw. In some cases there is an independent knee to thrown ahead of the other when a tapering log is to be cut; but a joint between the knee and the backbone is undesirable, and another way of doing the same thing is to have a strong slide which can be extended 6 inches; which will answer very well where short logs are to be cut with but little taper to them, as in the northwest. But where hard wood is to be sawed there will be need of more taper, sometimes over a foot in short logs, and in these cases the independent knee will be necessary.

It is well that the blocks be faced with steel, the facings being renewable when necessary, (say in two or three years.) To allow free passage for bark and dust, the ends of the blocks may be left open. The set shaft should be good and strong so as not to spring. In some cases the blocks are brought back by coil springs, which have the advantage that they take up lost motion,

If there be two many notches, there will be less liability of the pawl catching the right one, one or more notches being lost with a heavy log, and one or two too many being got when the log gets sawed down. Thus the first boards will be likely to be too thin and the last ones too thick; and there will perhaps be remnants on the blocks that will be of no use.

The set-work racks, where racks are used, should be of cast steel, so that no motion will be lost. If there be self receding blocks, there should be baffers to catch them. There should be a scale to show the distance from the knee to the saw, and it is very convenient to have one covering the back ends of the blocks, which will be more convenient for the setter. Blocks should be broad, heavy and strong. Pawls are best of cast steel, and should be broad.

There is advantage and economy in good sawing for every one concerned. If the trees are sold by the thousand, the seller gets more for his trees. If the mill is stocked by the job, the stocker gets more for his labor. If the sawyer saws by the thousand feet, he gets more money for sawing the same; and the mill owner gets more, too. The raftsmen like well sawed lumber, because it packs closely, there is less danger that boards outside of the grubs will wash out, and thick boards do not have to be put out to prevent this; water and mud are excluded, and the raft runs lighter and draws less water. Builders prefer well sawed lumber.

There is one thing that can be said in favor of very strong mills; that very long logs, especially if they be hewed, can be sprung considerably and thus made straighter before sawing. For this purpose there may be upon each knee a windlass with a lever and latch. Ten feet apart is a good distance for the blocks.

There are cases where once in a great while very long lumber comes in. To provide against this, the carriage may be of the ordinary length, but in two sections, doweled together so that they will match exactly, and held together by stout couplings. Then when the extra long logs come in the carriage may be opened out lengthwise and the long logs taken in.

For making stock boards it is well that the blocks have wings which will prevent the springing of the lumber as it gets thin, and will thus keep the last boards of right thickness and surface.

Modern mills have live rolls to catch the lumber as it comes from the saw, and take it to where it is needed. These rolls may be of iron, say 24 inches long and 9 to 12 inches in diamster, being hollow, and running in babbitted bearings kept well oiled. They may be driven by a counter shaft having friction bevel wheels, or a vertical shaft through the floor having either bevel gearing or a belt.

The dogs should be so proportioned that they will hold large, small, or medium logs. It is well that their points be steel bits which may be taken out and sharpened, or replaced. It is better that they hold the log or cant by its edges instead of spoiling its face.—*Lumber World.*

TREE PLANTING.

The subject of tree planting is becoming more fully impressed on the minds of western settlers as its importance becomes more fully recognized. Farmers are planting trees for windbreaks for the protection of their crops on the prairie land, and while they are serving this purpose they are constantly improving in value for the timber they produce, for which ample returns will be received in the future. The railroad companies also have awakened to the importance of this subject, and are substituting belts of timber for the fences, with which they have hitherto attempted to prevent snow blockades along the line of their tracks. These live fences have been substituted for pine fences by the St. Paul, Minneapolis & Manitoba road, with excellent results, and the Northern Pacific is also following the example, and will thus attempt to prevent the snow blockade of their tracks which have hitherto caused them such serious annoyance. It is considered that from its durability and other advantages the live fence will be much cheaper and more economical, as a pine fence to be anything like serviceable, must be at least eight feet high, and this costs in the neighborhood of $800 per mile. The necessity of tree planting on the western prairies is also recognized, not alone for the timber production, in order for its utilization for lumber purposes when it shall have attained sufficient growth, but also for the climatic effects and the increased rainfall, which many scientists maintain is derived therefrom. Whether this theory be correct or not, it is sustained by many of the foremost men, who have given their best thought and consideration to the investigation of the subject. Certain it is, also, that it has been practically demonstrated that in many prairie countries, where tree-planting has been extensively engaged in, the rainfall has been materially increased, and the surrounding country has been vastly more productive, and corn and other crops have prospered where they had previously failed. In many sections of Dakota where in former years nothing but a species of corn known as "squaw" corn would mature, since timber belts have been cultivated and matured, other grains have superseded the corn alluded to, and the territory has become prolific with crops which previous to the timber growth alluded to, were known to be if not impossible, at least very improbable of successful results. In some parts of Dakota and Nebraska in which fifteen years ago the rainfall for an entire season amounted to only six or eight inches, since its occupation by settlers who have tilled the soil and planted large tracts of young timber, it has increased very materially, running as high as 100 per cent. While some writers maintain that the increased rainfall springs from the cultivation of the soil, the more general excepted theory is that it has been produced by the tree growth and its action on the atmosphere. This view is also further partially sustained by the moisture produced in many sterile and arid sections further east, after the land alluded to had been adapted to the growth of timber as an experiment because of its complete usefulness for agricultural purposes. However it may be, certain it is that tree planting is being more extensively engaged in and receiving far greater consideration on the western prairies than formerly, and this result is doubtless superinduced by practical demonstration of the beneficial effects, not only as regards climatic influences, but also for the profits derived in the increased value of the lands and the constantly increasing value of the timber for utilization for fencing, building and other purposes.—*Lumberman's Gazette.*

DUTIES ON LUMBER.

Mr. Royal moved in the House of Commons on Thursday, March 1st, for copies of all correspondence relating to the abolition of duties on lumber imported into Manitoba and the North-West Territories. In doing so, he called attention to the very high duties which prevailed on this necessary article and the necessity of having them removed, or materially reduced on lumber imported into the North-West. It was a well-known fact that the country depended almost entirely for its lumber supply upon that brought in from the United States, and the cost on account of duty increased about $8 per thousand feet. Though the country possessed valuable pineries, they were not as yet developed, and a remission of the duty for a few years at least, till the home supply could be utilized, was very desirable.

Mr. Bowell said that the papers asked for would of course be brought down. Until they were produced and all the facts were before the House, it would not be possible to discuss the question intelligently. He might say though that the logs cut of which lumber was made and lumber in certain States were admitted free. He might also remark that a large number of logs had been purchased during the past year in the Western States, and floated down the Red River to be imported free of duty and manufactured in Winnipeg. It would be for the hon. gentleman to consider, when the papers came down, how far that interfered with the investments which had been made. He was not prepared to say that the price of lumber imported into the North-West was such as to justify the statement that the duty imposed amounted to $8 per thousand. To say that would be equal to saying that lumber purchased in Minnesota cost $4 per thousand. He was quite satisfied it would be found that large quantities of lumber were imported from Thunder Bay into Manitoba, and that ere long the north shore of Lake Superior would furnish the North-West with a very large proportion of its wood.

Mr. Blake said that if the consumer was to derive any advantage by getting his lumber from within Canada, it was clear that he must now be paying duty.

Mr. Charlton suggested to the Government the propriety of making the duty on lumber specific, instead of *ad valorem*. The duty was now twenty per cent., and the American Government imposed a specific duty of $2 a thousand, but our duty, if the price of lumber was $40 per thousand, reached $8 per thousand.

Mr. Watson (Marquette) said the price of lumber in the North-West was excessive, and in his part of the country the freight and duty together came to more than the original cost of the lumber at Minneapolis. The timber limits of the North-West were certainly being developed, but they did not half supply the demand. In view of that and the fact that freight rates were high, lumber should be admitted free. As far as Manitoba was concerned she did not require protection. Under the present policy, she had to buy her machinery and agricultural implements from Ontario, and to pay a price for them higher than she would have to pay if she could bring them from the other side. The Minister of Customs had said that logs came in free, but the hon. gentleman ought to know that the admission of logs free of duty did not lessen the price at all.

Mr. White (Renfrew) was sure the hon. member for East Simcoe (Mr. Cook) would not adopt the view of the hon. member for North Norfolk. The objects of the last speaker, regarding the lines upon which manufactured American articles should be admitted into Canada, Georgian Bay, and Lake Superior districts, were to supply Manitoba with its lumber, and the hon. member for East Simcoe (Mr. Cook) was making preparations to secure that trade for his firm. That hon. gentleman would therefore not favour the reduction or the removal of duties.

The motion was carried.

THE BRISTOL TRADE.

Messrs. King Brothers have issued their aual timber circular, being a report of the timber trade during the year 1882, which contains much interesting matter concerning the course of business at this port during the last twelve months.

In reviewing the timber trade here for the past year, they say it must be stated that the tonnage employed in the importation has been 80,248 tons register, against 68,328 tons register for the previous year. The importation in cubic feet has been 22 per cent. heavier than in 1881, 15 per cent. less than 1880, and about 5½ per cent. above the average of the last five years. The consumption, fortunately, has been slightly in excess of the importation, and 6½ per cent. in excess of that in 1881, thus showing that a fair amount of trade has been done, though generally at low values. Businesss throughout the past year was done at very close prices, and competition was not only confined to importers here, but also extended to those of the neighboring Channel ports, who sold largely in this market. We trust soon to have a fresh outlet for goods from this port by means of a new railway now prospected, which will not only be in the heart of our city, but in all probability around its quays.

Canadian Wood.—Quebec white pine.—The importation has been much below the average, consisting of but 7,320 loads, the whole of which excepting 358 loads, were for railway purposes. The enhanced prices for these goods so limit the consumption that, notwithstanding the smallness of the import, the stock carried forward for general trade is 180 loads, being only twenty loads less than this time last year. Red pine.—No import. The consumption has been 47 loads, and the stock on hand 20 loads. Oak.—The figures show a decrease in the importation of about 65 per cent. compared with last year. There has been a fair consumption, and the stock carried forward consists of 44 loads. Elm.—There has been only a sluggish demand; the importation was small, and the stock on hand is only 8 loads. Ash has been in good request; the consumption has exceeded the import, and the stock held is less than half of last year. Walnut.—No import. Stocks are quite cleared. Birch.—No import. There has been a good demand, and parcels that have been brought in coastwise have found ready buyers. The stock now held is nominal. Deals.—The importation is nearly equal to that of last year, about 30 per cent. of which came forward by the Montreal Line steamers, and included several parcels for inland dealers. Prices ruled high; there has, however, been a fair inquiry, and the stock carried forward is 37½ per cent. less than last year, consisting of 1,103 standards. Staves.—Only a small trade is now done in these goods, the consumption being so limited. Stocks are quite cleared.

New Brunswick and Nova Scotia Goods.—Spruce deals.—The importation has been larger than usual, and shows an increase of nearly 20 per cent. over 1881, whilst the consumption has been slightly in excess, thus leaving the stock on hand 2,312 standards or about 16 per cent. less than last year. Good values were obtained for these goods in the early spring, towards summer the chartering of several large steamers at low freights brought down prices, but with the withdrawal of the steamers from the deal ports freights rose, and deals increased in value until the end of September, since which there has been a gradual decline in price. Pine deals are not in favor, and have been only lightly imported. Birch, owing to the scarcity of Quebec, has been in good request, and with the exception of a small cargo now landing stocks are quite cleared.

TREES IN STREETS FROM A SANITARY POINT OF VIEW.

An interesting controversy on the utility of trees in streets and open spaces in cities has been lately going on in the Geneva journals. It arose out of a discussion in the International Hygienic Congress, which was held in Geneva in August, and Dr. Piachaud, a member of the Congress, has since contended, in the *Journal de Geneva*, that trees in streets do more harm than good; that they impede the circulation of air; and that as for the shade they afford, people who do not like sunshine have only to keep on the shady side of the street. Instead of planting more trees in towns, as some propose, he would rather, in the interests of hygiene, remove all existing trees. In reply to Professor Goret, of the University, points out that the functions of trees in streets are not limited to acting as screens for sun-shunning wayfarers; they temper the heat, and serve as a protection against dust. The evaporation from their leaves tends to keep the surrounding air cool and moist. One of the best means of refreshing the air of a sick chamber is to place in it plants and branches, and sprinkle them with water. A

like effect is produced by trees. Sunlight is necessary to health; but trees, if not to thickly planted, do not intercept sunlight; the perpetual vibration of their leaves and swaying of their branches admit the light every instant, and in sufficient measure, and serve, moreover, to protect the eyes from the noon-day glare. So far from trees impeding the circulation of air, they help to purify the air; the evaporation from their leaves determines a current from above, and the fresh air thus brought down helps to drive away the heated and dust-impregnated gases of the streets. Another useful property of foliage is that, while in hot, dry weather it moistens the surrounding atmosphere, thereby rendering it fitter to breathe, this effect, which is due to evaporation, ceases in wet weather. Trees, moreover, act as purifying agents by absorbing carboni acid and giving out oxygen. But the action of trees on the air is far less important than their action on the soil. Their roots draw up stagnant waters, and absorb the organic matters contained in the filth from which the streets of a town are never free, and which, after infiltrating the ground, are a frequent cause of fevers and infection. Trees, in fact, have the same on the sub-soil of towns as fields have on the contents of their sewers,—they act as disinfectants. Taking these facts into consideration, Professor Goret ventures to differ from the conclusions of the Hygienic Congress, strongly recommeds the planting of trees in streets and squares. But they must be planted with judgment. They should be placed at proper distances apart, and the branches should not be allowed to come in contact with the buildings near which they grow. The sorts best adapted for street planting are those which grow to a considerable height and spread out their branches. The fashion that prevails in some continental cities of cutting trees down to a uniform size is highly objectionable. The branches of trees so treated becomes so compacted together as to be impervious to light, and the shade they give, although deep, is too circumscribed to be of much use.—*Boston Journal of Chemistry.*

INDIA RUBBER DISCOVERED.

Two species of India rubber yielding trees have recently been discovered in British Guiana of a character which insures their future profit to the colony. One is a near ally of the para rubber tree, and is known to the aborigines of the country by the name of Hatie, its botanical name being *Hevea spruceana*. It is about sixty feet high, with a trunk diameter of twenty inches, and is found on the alluvial oft-flooded land of the creeks and banks of the lower parts of the rivers, where in places it is abundant. The second is not scientifically known yet, as flowering specimens of it have not been obtained. It is one of the largest trees of a forest flora peculiarly rich in large types. The trunk is four or five feet in diameter, and runs up straight sixty or seventy feet unbranched, above which the head extends many feet more. On its discovery recently a few branchlets could only be obtained by shooting them off with large shot. The bark is thick and wonderfully rich in milk of excellent quality, and the elasticity and tenacity of the rubber seem to be unsurpassed. It is scattered in individual trees over a wide area of colony. The produce of these trees has not been put in the market yet, collectors apparently being unacquainted with them. Samples, however, have been sent to England to be valued. The discovery of these was made by Mr. G. S. Jenman, Government botanist, during an exploration which he lately made in British Guiana.—*London Daily News.*

A CURIOUS FIR-TREE.

Switzerland has its old chesnut-trees on the banks of Lake Leman, and the ancient linden of Fribourg, the history of which is said to go back to the time of the royal conflicts with Charles the Bold. M. Louis Pire, President of the Royal Botanical Society of Alliaz, Canton of Vaud, which he believes to be older than the linden of Fribourg, and considers entitled to be regarded as the oldest and most remarkable tree in the canton, if not in the whole confederation. It is growing near the baths of Alliaz, at a height of about thirteen hundred feet above the hotel, and forty-five hundred feet above the sea, surrounded by a forest of firs, which it overtops by more than thirty feet. The trunk of this tree is ten metres, or a little more than thirty feet in circumference at the base. At about a yard from the ground it puts out, on the south side, seven offshoots, which have grown into trunks as strong and vigorous as those of the other trees in the forest. Bent and gnarled at the bottom, these side trunks soon straighten themselves up and rise perpendicularly and parallel to the main stem. This feature is not, perhaps, wholly unparalleled, but another most curious fact is that the two largest of the side-trunks are connected with the principal stem by sub-quadrangular braces resembling girders. These beams have probably been formed by an astomosing of branches, which, common enough among angiosperms, is extremely rare among conifers; but it has been impossible to ascertain the manner in which the ingrowing of one branch into the other has been effected. The adaption by which a limb, originally destined to grow free and bear foliage, has been converted into a living stick of timber, is a strange one, and effords a new illustration of the power of nature to fit itself to circumstances. The space between the rough flooring formed by the growing together of the offshoots, at their point of departure, and the girder-limbs, is large enough to admit of building a comfortable hermit's hut within it.—*Popular Science.*

A TIE TEST.

M. Chevalier Drolet, of Canada, last season made a visit to Paris, for the purpose of impressing on the French government the superiority of Canadian timber for railway sleepers, so that they should be employed in the immense railway schemes the government has in contemplation. The forests that have heretofore been drawn upon for sleepers lie on the shores of the Baltic, in the Danubian principalities, and in Italy. The French government expected to be able to use 6,000,000 ties a year, and M. Drolet thought it would be an excellent scheme to supply this timber from Canadian forests. He took some samples with him, and showed them to the minister of public works, a series of tests being afterwards applied to the samples. The tests consisted of severe traction and crushing, and were pronounced satisfactory. M. Drolet was about to sign a contract to deliver 7,000,000 ties, when the government was frightened out of the railroad scheme by an article written by Leon Say, and the contract fell through. The question now is, whether the government will continue the railways eventually, or hand them over to the great companies. In either event M. Drolet thinks that Canadian ties are sure of a market in France. He bases this conclusion on the fact that he was compelled, on account of the lateness of the season, to decline a contract to deliver 370,000 ties at Bayonne to be used in the construction of a railroad in the north of Spain.

Tannin in Bark.

The *Lumberman* is in receipt of Forestry Bulletin No. 24, showing the amount of tannin in the bark of some of the trees in the United States. The highest percentage, 31.04, is found in mangrove, that grows on the gulf coast. Oak ranges from 5.99 to 16.46 per cent., the latter being for the bark of the chestnut oak of the Pacific coast. Hemlock varies from 13.11 to 15.87 per cent. The lowest in the list is the bark of the yellow oak that grows on the Atlantic coast. As the bulletin asserts that the figures given "do not indicate the real value of the bark of the species for tanning which can only be obtained by actual experiments made on a large scale, other properties of the bark, besides the percentage, affecting the value of the leather prepared with it," it is somewhat difficult to determine of what practical use they are.—*Northwestern Lumberman.*

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

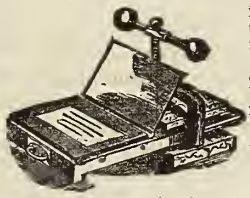
ZUCCATO'S PAPYROGRAPH



is a new invention for the rapid production of fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.

Autograph Letters

Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet

500 COPIES PER HOUR

may be printed upon any kind of dry paper, or other material, in a common Copying Press.

This is the Most Simple, Rapid and Economical Process yet Discovered.

THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.

The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.

For specimens of work, price-list, etc., address with stamp.

THE PAPYROGRAPH CO.,
43 and 45 Shetucket Street, Norwich, Conn.

EARS FOR THE MILLION
Foo Choo's Balsam of Shark's Oil
Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.

This Oil is abstracted from peculiar species of small **White Shark,** caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous,** that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!

It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:

JAMES EPPS & Co., Homœopathic Chemists,
18Lly London, England.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. PETERBOROUGH, Ont. MARCH 15, 1883.

REPORTS from Muskegon are to the effect that the crop of logs will fall very far short of the anticipated cut at the commencement of winter operations.

A chestnut tree in North Carolina was recently felled that was nine feet in diameter. It is estimated that it was a sapling when Columbus reached America.

THE Belleville *Intelligencer* says that a number of shanty men have returned home from the woods. They assert that the cut is very large and that the drive will be an early one.

IN North Carolina are 40,000 square miles of almost unbroken forests. In ten years from this time, it is estimated, these will be worth more than the present total valuation of that State.

The German Federal Council have assented to the increase of timber duties, proposed by Prussia, the new tariff being 30 pfennings and 70 pfennings on every 100 kilos of raw and sawn wood respectively.

ARKANSAS, it would appear, is not entirely devoid of large timber. A tree was recently cut in Hempstead county, in that state, which measured twenty-six feet in circumference. This would do as a companion to some of the large California trees.

AN Ottawa correspondent says:—Lumbermen are in capital spirits at the quantity of snow which is on the ground and the length of its duration. So favourable has the winter been for their operations that one team has been able to do as much as two last winter.

ABOUT 18 miles from the City of Mexico, on the road to Toluca, is situated a large area of pine forest, in which the growths are said to be as fine specimens as can be found on the American continent. No streams to float logs abound in the region, and it is thought that portable mills will have to be rolled on to cut the trees into lumber before it is removed. The American plan of constructing logging railroads would settle the question of transportation.

PETER LOUSCHER recently cut near St. Joseph, Wis., what is regarded the largest spruce tree ever felled in that region. It was designed for a vessel spar, and is 100 feet long and three feet through at the butt.

MR. JAMES BETHUNE, Q.C., of Toronto, who went to England a few weeks ago, has obtained permission to bring the case of McLaren *vs.* Caldwell before the Judicial Committee of the Privy Council. Mr. Caldwell appeals from the decision of the Supreme Court of Canada.

COMPETENT judges place the cut of Duluth, Minn., mills next season at 141,000,000 feet, and a correspondingly larger increase in the manufacture of lath and shingles. Comparing the log cut and the capacity of the mills it looks as though more mills were needed immediately.

THE lumber dealers of Chicago and Michigan City are protesting against alleged discriminations in freight charges by the railroads in favor of eastern and upper Michigan. They claim to be losing heavily in trade in consequence of the present tariff. The railroads are considering the complaint.

A KINGSTON despatch says that Messrs. Boyd, Caldwell and Co. are erecting a mill on the line of the Kingston & Pembroke Railroad, at Caldwell Lake and near Wilbur station. It will have a cutting capacity of 30,000 to 40,000 feet of lumber per day. The product of the mill will add materially to the freight of the of the railway.

The Campbellford *Herald* says:—A messenger from the woods informs a person who reports the matter to us, that at the shanties in the northern sections, the snow is six feet deep on the level. Shantymen need to study the trees they cut down to avoid accident or death, and it is sometimes "nip and tuck" work clearing themselves from the falling pines.

THE Emerson *International* says:—Wardrop & Co., one of our heavy lumber-dealing firms, have opened a branch lumber yard at Stephen. They will stock it with $5,000 worth of building material, and have commenced the shipment of stock, both by rail and by team. John Hewitt, who has been in the yard of the firm here, will have charge of the yard at Stephen.

THE *Lumberman's Gazette* says:—Washington Territory is destined ultimately to become a thriving hive of industry. A territory with 160,000,000,000 feet of standing timber within its limits, or sufficient to supply the present cutting capacity of all the mills in Michigan over forty years, with the continuously growing demand for lumber in this country cannot fail to become a prosperous and wealthy state, in the not very distant future.

A FINE stain can be imparted to furniture made of beech or pine in a very simple manner. Dissolve three ounces of permanganate of potash and three ounces of sulphate of magnesia in two quarts of hot water. Apply this to the surface of the wood with a brush, and repeat if necessary. The maganese salt is decomposed in contact with the fibre of the wood, and a fine, permanent stain produced. If the objects are small, a more dilute bath can be prepared, and the wood immersed in it for one or five minutes until it is thoroughly stained.

THE NEW YORK STATE PARK QUESTION.

The *Northwestern Lumberman* says:—The reservation of 600,000 acres of forest land in the Adirondack mountains, New York, by act of the legislature, to be perpetually devoted to sporting and sanitary purposes, does not entirely meet the views of lumbermen interested in that region. Below appears a communication from Mr. George W. Sisson, a mill-owner at Sissonville, near Potsdam, N. Y., and a prominent lumbermen in that part of the state, to a representative of his district in the legislature, which sets forth the views of lumbermen on the reservation question. The bill which Mr. Sisson opposed has passed, and hence, as an argument against it, his communication has lost its value but as setting forth the condition of the Adirondack wilderness, and the effect on its forests of lumbering operations, it is interesting and valuable. The last paragraph of the letter is very suggestive, and exactly "what's the matter" with other questions, pertaining to forestry and the lumber business, than the one considered by Mr. Sisson:

It is not a fact that the lumbermen by their operating do to any appreciable extent denude the forest of its timber so that the effect is seen in the flow of the streams or storage of moisture.

The timber cut for market is spruce and pine, and the hemlock, where the hemlock bark is accessible to a tannery, leaving untouched all the hardwoods—together with the tamarac, balsam, cedar, etc., which constitute by far the greater and prevailing portion of the forest trees. Ordinarily the lumbermen cut not more than 15 standard logs to the acre as an average, and often less. Mile-square lots, that average to cut that, are called good lots, and were it not for the occasional stumps and log roads, the timber removed would not be missed. It is folly to talk about of the lumbermen denuding the forest of timber. Where lumbering has been done eight or ten years the growth of timber has much more than replaced that which was cut. The only danger to be apprehended of forest fires, is from carelessness of sporting parties who have no interest at stake or property to suffer from their want of proper care in leaving camp fires.

There are in this, St. Lawrence county, several townships that have been entirely lumbered over for spruce and pine, and some of them the second or third time, and to-day they are well timbered with all the other native woods, in fact are well wooded lands, and furnish as great an amount of moisture, without doubt, as before an axe was struck on them.

Settlement has not followed to any extent in the wake of lumbering in the Adirondacks, neither is it likely to. If these lands had value for settlers' lands do you think the owners would have allowed so large an an amount of them to revert to the state for the small amount of taxes? One hundred years of lumbering has not worked up to the foot hills of the Adirondacks. The virgin forests still exists and is still the home of wild game in abundance—it is still as great a reservoir of moisture as ever.

It is known to lumbermen that spruce timber is dying to a large extent all through the forest, and many owners are cutting their spruce timber to save its value. Is it not for the interest of the state to have its citizens convert this spruce timber into its money value and give employment to workingmen, rather than have it become a total loss? besides these dead, dry trees endanger the remaining timber by increasing fire hazard.

I think the promoters of Senator Lansing's bill or other state park bills should take measure to prevent the construction of the Adirondack railroad through the wilderness, for the result of that would be to develop lumbering along its line, and a railroad though the woods would be quite likely to originate some forest fires and be of far greater damage than the present lumber interest.

The report shows the state to hold 600,000 acres of wild lands in ten counties. These isolated parcels of land, situated in 10 or more counties, will hardly form the nucleus of a state park, and cannot accomplish the object sought in the bill. It would require the purchase by the state from private owners of several million acres to join and connect together the parcels now held by the state. This I understand to be the plan, and I think there will be many land-owners who will be glad to pool their lands with the state for a bidder.

The demand for the passage of this or similar bills does not come from practical business men, but solely from theorists and gentlemen of leisure, members of sporting clubs and parties not in any manner competent to judge of the requirements of or advisability of what they ask for.

THE FORESTS.

The *Lumberman's Gazette* says:—The desirability of forestry commissioners in each state is fast forcing itself upon the attention of the people of this country. The rapid denudation of the timber in the country, and the entire lack of anything approaching systematic effort for timber cultivation, and the evil effects of forest removal, both in a climatic sense and in its influence on floods and drouths, has become apparent to escape the observation of those who have given any serious consideration to this subject; and hence forestry conventions have resulted and other movements have been set on foot, if possible to measurably relieve the evil effects of past injudicious legislative and other action. A national agricultural convention has also awakened to the necessity of action in this direction, and passed the following resolutions in behalf of forestry:

"Whereas, We begin to realize the lamentable wasting of the forest lands in the United States, and sad effects of their destruction upon the climate and water supply of the country, and we are forced to confess our need of the knowledge of the better management of the woodland than is now possessed by the people; therefore,

Resolved, That we urge upon the State Legislature the propriety of selecting judicious persons to act as state forestry commissioners, whose duty it shall be to instruct the people in regard to forest trees and their production and management; said officers to report annually upon the condition of the woodland in their respective commonweaths.

Resolved, That we beg of the agricultural colleges established under the land grant of congress, that they shall lose no time in planting state arboreta and establishing forest experimental stations, where all species adapted to the soil and climate shall be tested, and whence surplus seeds and plants may be distributed. Annual reports of these establishments to be made to the governors of the boards of agriculture.

Resolved, That congress be asked to establish one or more experimental forest stations upon the public domain, where the propagation and testing of useful trees shall be the leading object, with the collection of seeds and plants to be distributed by or under the direction of the United States agricultural department, to which bureau these stations should make annual reports."

The above recommendations deserve the thoughtful considerations of state governments and all of those interested in the future welfare of the country.

VERMONT TIMBER.

A correspondent of the *Northwestern Lumberman* writing from Montgomery Centre, Vt., says:—Spruce lumber stands without a rival in this section of the country for its adaptability for building purposes. It is used for square timber, studding, joist, rafters, outside boarding, inside sheathing, outside and inside casing, clapboards and shingles. The poorer, or third quality, is used extensively for packing boxes, for transporting dry goods, groceries, hardware, medicines, boots, shoes, etc. And here in the East there is no wood that is in so general use for butter packages; both in tubs and boxes. It has been in use in this country and vicinity, almost exclusively, for the past 50 years, and I think that the uniformly high quotations in Boston and other markets for many years past, of Franklin county, Vermont, butter (with St. Albans as the shipping point), is pretty good evidence of the excellence of packages when well manufactured for that purpose, for certainly no such prices could have been so uniformly obtained if the packages had not been of good material for preserving the butter. Many of these butter packages, amounting to millions in number, are annually shipped from the East to the South and West, while large quantities of sawed lumber are shipped to Massachusetts and Connecticut, and other places South.

For all the purposes that I have named, the durability of spruce lumber is all that could be desired, except for shingles, but for that purpose and others, where it is exposed constantly, or frequently, to moisture, as for fence posts, water conductors, etc., it is inferior to cedar, pine, tamarack, and some other kinds of timber. Perhaps it would not be out of the place here to say, that the spruce in this part of the country is rapidly disappearing. Everywhere

the lumber business is much more extensively engaged in than at any previous time, and I have no doubt that the prices now obtained are insignificant, in comparison to what they must be in the near future, if the business continues, even to the extent it is now being prosecuted.

Hemlock lumber is also being shipped quite extensively, as the bark is in good demand at remunerative prices for tanning, and the lumber, if not too far from the railroad, can be handled at a profit. Hemlock will, no doubt, come into more general use, as spruce advances in price, it being well adapted to many uses that the second and third qualities of spruce are used for. Basswood is also quite extensively used here for inside finish in buildings and for house-furnishing goods, and the bodies of sleighs, waggons, and in many other directions, it being a light wood, and not easily split or broken.

RESOURCES OF OREGON.

The resources of a country like this will be difficult to measure; for since it is new, its mineral resources probable are for the most part undiscovered. Enough is known, however, to say that Oregon is rich in iron, coal and timber. These three factors are certainly sufficient to make a state of immense wealth and population. Let the timber be removed from the country bordering on the Pacific ocean, as it will be to supply the greatly increasing demand of lumber for Australia, China, South America and Mexico, and there will be uncovered low hills and valleys all covered with excellent soil. To the capitalists and manufacturer of the east here is a good field. First, in the manufacture of lumber at the mouths of the logging streams; next, in bringing by a railroad running along the seashore from Coos bay on the south to Astoria on the north, carrying lumber from the shallower to the deeper outlets for export. One million feet of lumber per day is said to be the average now shipped from Puget Sound. Along the seashore of Oregon, and extending for twenty miles inland, there is an abundance of large hemlock, the bark of which is said to be much stronger in tannin than the Maine bark,

In short, here in Oregon, along the seacoast, there is a country rich in resources awaiting the development of the lumbermen, railroads, tanners, dairymen and small farmers, not yet taken up. Going east across the coast range of mountains there are a chain of valleys, the paradise of farmers, but now tolerably well settled. Going still farther east there is the Columbia river basin, the Ochoco and Kalamath counties, which are dry (but not too dry), unsettled as yet, inviting thousands of farmers and grazers to come and make for themselves homes.—*Portland (Oregon) Letter to Washington Star.*

THE CHESTNUT IN ITALY.

Sig. Schira, Inspector General of Forests, in an interesting report, says among other things that the famous chestnut tree on Mount Etna, which still lives, measures 64 metres in circumference at its base. Its age is estimated differently—some attribute to it 4,000 some 2,000 years, and recent studies give it 660 years. There are some other famous chestnut trees in Italy, notably one in Montamiata, in Tuscany. The deplorable custom of late years to destroy the forests has deprived Italy of many noble chestnuts, but it is to be hoped they will be protected by the new scheme of the Minister of Agriculture for re-wooding the denuded mountains. In the north of Italy the chestnut grows at an altitude of from 400 to 900 metres above the level of the sea; in sunny situations even at 1,200. In the south the zone of growth is between 500 and 1,200 metres above the level of the sea. Almost all the Italian provinces cultivate the chestnut, these trees occupying the total superfice in Italy of about 496,114 acres. The most are found in the provinces of Lucca, Sondrio, and Genoa. In Lucca, for example, 181.52 per thousand acres of the territory are occupied by the chestnut. The total annual produce of chestnuts (fruit) is about 5,768.436 quintals. Those of Cuneo are best both for quailty and quantity. The exportation is about 70,000 quintals, at a profit of about 2,000,000 francs. There are several methods of preserving the fruit—from sugaring the chestnuts to slightly boiling and then drying them, or laying them, when newly gathered in November, among perfectly dry sand in vases, and burying the vases in dry earth, when they will remain fresh and good till next June.

FLOODS IN THE STATES.

The Buffalo *Lumber World* says that a person of an imaginative turn of mind might be easily convinced that the elements were leagued together this season to harass, impede and embarrass as much as possible all who are engaged in the production and sale of lumber, or that the water sprites had determined to avenge the unceasing injuries done to their protectors from time immorial, the forests. Within the last month a great deal of damage has been done in various sections of the country by floods, more particularly along the Ohio valley and in the states of Ohio and Pennsylvania. The lumber business has probably suffered as much as, if not more than, any other. Cleveland lumber yards lost 23,000,000 feet of lumber and 15,000,000 shingles, the pecuniary loss to lumber dealers in this city alone being estimated at nearly a quarter of a million dollars. In other localities, saw mills have been swept away, lumber scattered broadcast over miles of flooded territory and general property destroyed wholesale. Several towns have been almost utterly ruined by the floods, though happily the loss of life has been comparatively small. In the lumbering districts of the northwest, on the other hand, the snow has been so deep in many localities as to impede logging operations to quite an extent. In now appears probable that the cut will fall a little short of what was anticipated at the beginning of the season, but doubtless logs enough will be banked to keep the mills busy during the season, together with those that have been held over.

SPRUCE IN ENGLAND.

The *Timber Trades Journal* of February 24th says:—That in the first week of the past month spruce deals touched their lowest cargo limit in the market is now pretty evident. Why they should have, since November last, so suddenly fallen in value is inexplicable, unless the theory be admitted that a scare is, in itself, a sufficient cause for some large holders of stock to press their goods to a sale at the risk of serious loss. Doubtless towards the close of last year orders were getting scarce; and the reduction made in price possibly had the immediate effect of passing some amount of wood into consumption which might otherwise have laid for a time at the ports. Unfortunately, the disturbing effects which result from excessive fluctations of prices are not always confined to the area immediately affected by them. Without doubt, the sudden and extensive fall in the value of spruce, approximating to some 12 per cent., had a most disturbing effect upon Baltic goods. We can now see that there did not exist any sufficient reason for the scare—for such we are disposed to designate it—and the probability rather is that the spruce market will quickly resume—or at any rate very nearly resume—the position it held at the commencement of the last quarter of 1882.

Pruning Trees.

In a recent French work on the philosophy of pruning the following rule is given: "The system is based on the fact that, as wood is formed by descending sap alone, a wound made on a tree can only become covered with healthy new wood when its entire surface is brought into connection with the leaves by means of the layer of young and growing cells formed between the wood and the bark. To make this connection it is necessary to prune in such a manner that no portion of the amputated or dead branch shall be left on the trunk. The cut should always be made close to and perfectly even with the outline of the trunk, without regard to the size of the wound thus made. This is the essential rule in all pruning, and on its observance the success of the operation depends."

Maple Sugar.

The sugar bushes of Vermont and western Massachusetts have changed considerably in aspect within fifty years. Formerly the iron kettle was the apparatus used for reducing the sap. The big fire of logs and limbs under the kettle would particularly on a windy day, fill the boiling sap with ashes and cinders, which, coupled with the rust on the iron, produced a rich, dark color in the syrup. To get the "settlin's" out, or make the "skimmin's" rise in order to scoop it off, milk, and sometimes eggs well beaten together, were poured in, only to burn black and make more "settlin's." The straining of the sap, the improved evaporators, and the arch of the present day were unknown. But it was not the custom then to melt up old sugar, flavor it with fresh boiled sap, and sell it for first-class new sugar, as is done by the wholesale at the present day. The sugar-making season of 1883 is expected to be very profitable.

THE TIMBER OF IDAHO.

The *Wood River Miner*, of Hailey, Idaho, thus describes the timber of that region: Pine timber is abundant on all the high mountains of the Wood and Salmon river region. Just about Hailey, at the base of the mountains, there is but little; but beautiful tongues of evergreen forest run down the mountain side three miles further up, and from Warm Spring creek, 14 miles above Hailey, through to the British possessions, is almost one unbroken forest. The best timber for mining purposes is the red fir, which is very strong and tough, and grows mostly in the lower hills. Up higher in the mountains predominates the black pine, better adapted for charcoal, cordwood, etc. Some spruce and white or balsam fir, with the red fir and black pine, comprise about all the species of the conifers growing in this section. The cottonwood, alder and quaking asp grow along the streams. That paper further says there are no Indians in the entire Wood river country, and the prospector or settler is as safe from their depredations there as he would be anywhere along the Ohio. Extensive planing-mills are wanted at Hailey. There is a vast and rapidly increasing consumption of lumber, and no planing-mill within 140 miles.

WORTH KNOWING.—A Fact Worth Knowing. The best household remedy known for Coughs, Colds, Bronchitis, Asthma, Whooping Cough and all throat and chest troubles tending toward Pulmonary Consumption is Hagyard's Pectoral Balsam, to be procured of any druggist.

WALTER LINTON, of Waterloo, writes that Hagyard's Yellow Oil has done great good in his family, his wife being cured of Callouse lumps that other medicines failed to remove, he he also states that a neighbor was promptly relieved of Rheumatism by the same remedy.

MR. THOMAS W. RACE, Editor and Proprietor of the Mitchell *Recorder*, writes that he had a prejudice against Patent Medicines, but being induced to try Burdock Blood Bitters, for Billiousness that occasioned such violent headache and distress as to often disable him from work. The medicine gave him relief, and he now speaks of it in the most favorable terms.

MINNESOTA
PINE LANDS
FOR SALE.

THE SUBSCRIBER OFFERS A TRACT OF
8,000 ACRES
Of PINE LANDS, in St. Louis County, Minnesota, carefully selected and estimated to cut **FORTY MILLION FEET**, well located on good driving stream, tributary to Duluth.

A. McCALL,
6L1 Lumber Merchant, Simcoe, Ont.

320 ACRES FREE
IN THE
Devil's Lake, Turtle Mountain And Mouse River Country,
NORTH DAKOTA,
Tributary to the United States Land Office at
GRAND FORKS, DAKOTA.
SECTIONAL MAP and **FULL** particulars mailed **FREE** to any address by

H. F. McNALLY,
General Travelling Agent,
St. Paul, Minneapolis and Manitoba Railway,
2m **28 E. Front Street, Toronto.** L2w3

Wanted to Purchase.
LARGE QUANTITIES OF
CLEAN
SPRUCE and PINE
One foot Long and upwards; three inches thick; three to seven inches wide.

S. J. MORELAND,
LUMBER IMPORTER,
And Manufacturer of all kinds of Safety Paraffin and Vesuvian Matches.
GLOUCESTER, ENG.
February 20th, 1883. 3t6

PUBLIC NOTICE
J TRADE MARKS. TESTED
Granted according to Act of Parliament and Registered in England, Germany, Canada and the United States.
J And Beam Engine Marks.

It having come to the knowledge of Messrs. Thomas Jowitt & Sons, of Scotia Works, Sheffield, in the County of York, Merchants and Manufacturers, that several manufacturers and merchants in Sheffield and in various parts of the Dominion of Canada, are pirating the above mentioned marks of J and "Beam Engine," which are the exclusive property of the said Thomas Jowitt & Sons, and which trade marks have been duly registered in the Trade Marks Registry of London, and the latter of which has been duly granted to Albert Alsop Jowitt, of the said firm of Thomas Jowitt and Sons, by the Cutlers Company of of Sheffield, aforesaid, NOW NOTICE IS HEREBY GIVEN, that legal proceedings will be immediately instituted against anyone trading in Goods of Steel or of Steel and Iron combined, whether with or without a cutting edge, which Goods bear either of the above marks, unless such Goods are of the manufacture of THOMAS JOWITT & SONS.
Dated this 21st day of October, 1882.

YOUNG WILSON & Co.,
EAST PARADE,
SHEFFIELD, ENGLAND,
Solicitors to the said 6L3
THOMAS JOWITT & SONS

VALUABLE
TIMBER LIMITS
FOR SALE,
Situated in the Nipissing District.

The following very desirable limits will be offered for sale at Public Auction (if not previously disposed of) at the
Grand Union Hotel, Ottawa, Ont.
—ON—
TUESDAY, 24th Day of April, 1883,
At 2.30 O'CLOCK IN THE AFTERNOON.

Berth No. 23, Nipissing.....36 square miles
do 43, Georgian Bay.....36 do
do 51, do .....36 do

BERTH 23 is heavily timbered and is very favourably situated for lumbering. The Canadian Pacific Railway crosses the south-west corner of the limit, and parties desirous of manufacturing lumber for shipment to Manitoba and the North-West would find this an excellent opportunity for establishing such a business. There is said to be a good mill site on the berth, with good facilities for piling and for shipping either west or east.

BERTHS 43 and 51 are adjacent limits, conveniently located for getting logs into Georgian Bay.

The terms and conditions of sale will be made known at the time of sale.

Further particulars may be had on application to Mr. W. H. Rowley, Manager of the Merchants' Bank of Canada, at Ottawa, Mr. Wm. Cooke, Manager at Toronto, or to

R. C. W. MacCuaig,
Auctioneer, Ottawa.
February, 28th, 1883. 3L6

FORESTRY IN MICHIGAN.

The following paper by V. M. Spalding, Ann Arbor, Mich., was read at the meeting of the American Forestry Congress, at Montreal:

It is not necessary to go into an argument to show that Michigan ought to be interested in forestry. Everyone knows what an element the forests have been in our prosperity. According to a late report of the Commissioner of Immigration "the aggregate value of the forest products of this State already mentioned is largely in excess of $8,000,000," and the timber product of a single year, 1879, amounted to $60,000,000, or about thirty-five per cent of the total value of the natural productions of the State for that year. Michigan produces more salt than any other State in the Union, and the brine is evaporated by means of the refuse from the great saw mills in the vicinity of Saginaw and other lumbering towns. Ours is the second State in the production of iron, and the blast furnaces of Ironton, Elk Rapids, and a number of other places are drawing the supply of charcoal for its reduction from the great hardwood forests in their vicinity. The products of these forests are sent to the ends of the earth. Much of the first lumber of the Atlantic cities and of the Old World comes from Michigan pineries. Threshing-implements, furniture and a long list of articles requiring wood in their manufacture are made in the state and exported from it, their manufacture being a source of support to fifty thousand of our people and their sale a steady source of wealth to the State.

Nor is it necessary to repeat the well-known fact that our forests are rapidly disappearing. The bulletins of the last census, accessible to everyone, show that the estimated amount of merchantable pine timber standing in Michigan May 31st, 1881, was thirty-five billions of feet. At our present rate of consumption, five billions of feet annually, it will take seven years to use up our pine forests. Suppose, however, that the estimates of the amount remaining, although made with great care, are too low; suppose for safety the pine will last twice as long as has been estimated, the fact still thrusts itself upon us that in a few years this great source of our wealth will be gone.

What are we doing in view of these facts? We are going on with astonishing energy and improved machinery to hasten the end. Every man who can do so is trying to get a piece of pine land, or a quantity of logs before they are gone, and our own people, in company with eastern capitalists, are planning the speedy destruction of the hardwood forests as soon as the pine lands have been stripped. The newspaper articles that charge this thing upon us are not sensational. They do not tell all the truth.

We have squandered with reckless haste the abundant forest wealth with which the State was endowed, and, besides all this, time and again, forest fires, that might have been prevented, have swept over fair portions of the commonwealth, carrying swift destruction with them and completing the work that the axe had begun.

In the study of this subject then we may as well turn our attention at once to the forests of the future, for it is evident that those of the present will be gone in a few years. Our own legitimate wants and the great profits of lumber trade have already settled the question for Michigan. If we want forests we must make them.

Without repeating the arguments that have been given so fully by others, I shall assume, what is admitted by everyone who has bestowed erious thought upon the subject, that the highest welfare of the State requires the establishment and continued maintenance of a suitable proportion of wood-land. It may be assumed, too, that, in due time, both Government and people, moved by necessity, if by no higher influence, will unite in a settled purpose to secure this. Bs soon as this attitude is taken by the people of the State, and we are ready to enter upon the work of reforesting, we shall find ourselves face to face with various difficult problems. Some of us, perhaps, may render a service by studying these problems now, viz.:—

(1) What parts of the State and what portion of its area should be covered with forests?

Economists estimate about twenty-five per cent. as a suitable proportion, but this varies with the position, physical character, and commercial interests of the State or country under consideration. The State of Michigan contains large areas that are worthless for any other purpose than raising timber, and still more extended regions that, if not absolutely valueless for agricultural puposes, can be used to far better advantage in growing trees than in raising any other crop whatever. Undoubtedly, the great question with us is, how, in the most direct practical way, can we rehabitate the entensive regions in the central and northern parts of the lower peninsula that have been stripped of their pine forests, and the remaining portions of this region that will so soon be bare? Anyone that has been through this part of the State will remember its desolate and ruined aspect. "The valuable trees were all felled years ago, and the lumberman moved on to fresh spoils, leaving behind an inextricably confused mass of tree tops, broken logs, and uprooted trunks. Blackberry canes spring up everywhere, forming a tangled thicket, and a few scattering poplar, birch, and cherry trees serve for arboreal life, above which tower the dead pines, bleached in the weather and blackened by fire, destitute of limbs, and looking at a distance not unlike the masts of some great harbor. Thousands of such acres, repellant alike to botanists and settler, can be seen in any of our northern countries."[Erwin F. Smith, "Flora of Michigan."] While there is good soil to be found in this region, much of it is light and sandy, altogether unfit for farming purposes, but it has raised one of the finest forests that ever clothed the surface of the earth, and if it can again be covered with such a forest it will become in the future, as it has been already, a source of almost unlimited wealth.

Another portion of the State will soon force itself upon our attention, unless it is cared for. All along the eastern coast of Lake Michigan sand-dunes extend, precisely similar in their nature, though of less extent than those of the Old World. While these dunes are covered with vegetation they keep, for the most part, within their limits, but indications of what they may do, when free from such control, may be seen at Grand Haven, Michigan City, and other places along the shore, where piles of fine drifting sand are covering railroad tracks, and fences, and some trees, and, in some localities are encroaching upon cultivated fields, to the dismay of their proprietors. The experience of Western Europe is conclusive upon this point, and it is the manifest duty of the State, and of the people, to absolutely prohibit and prevent the clearing away of trees, or even excessive pasturage of such lands, and to encourage by every suitable means, their reforesting.

The farming lands in the southern portion of the lower peninsula all need a fair proportion of woodland for fuel and shelter, and the great majority of these farms would be rendered much more valuable in a few years by judicious plantations of trees; so, also, the northern peninsula, though still heavily wooded over large areas, already has extensive regions that have been stripped of their forests, and that can be turned to better account for this than for any other purpose. We may safely conclude, therefore, that the State of Michigan requires fully as great, and probably a greater proportion of its area to be kept in wood-land than has been estimated as necessary for other countries; in othe words, more than twenty-five per cent. in this State, rather than less, may properly be covered with timber.

(2) What kinds of treess shall we plant?

To answer this question we must know something about the different species of trees, the soil and climate to which they are adapted or to which they can bo induced to adapt themselves, what kinds will endure unfavorable conditions best, what trees will grow rapidly, and what sorts are most valuable for timber or other products.

Without attempting to decide all of these questions in detail—many of them requiring not only careful study but long experiment, for which the State makes no adequate provision, as yet—there is one very important question suggested at the outset, and that must be met, whether it can be settled at once or not. The question is, how much significance must be attached to the principle of rotation? It has been commonly noticed that forests of oak succeed those of pine, and *vice versa*. Oak and hemlock forest have been succeeded by those of elm, beech and maple. When the pine woods in the northern part of Michigan and Wisconsin are cut off, poplars, birches, and the red-cherry spring up, and so, as in many cases, this succession seems to be pretty uniform and constant. There has grown up a half popular, half scientific notion that it must be so, and that, if we are to succeed in reforesting our denuded pine lands, we must follow the order of nature. We have no right, however, to follow nature blindly, and sometimes we can take a short cut while nature is going around a corner. No one has ever formulated an order that governs the succession of forest trees, nor has it ever been shown that there is any such unvarying order of succession. On the contrary, it is one of the most variable things with which we are acquainted, and there is every reason for believing that it depends more upon what the ground is seeded with than anything else. The reason why birches, poplars, and red cherry spring up on our wasted pine lands is that the seeds of these species are carried there by the wind and by the birds, and there is no doubt whatever that other and better trees may, with suitable pains, be made to take their place. When we plant trees about our houses, or along the highway even, if it happen to be new land, we do not stop to make a critical inquiry into the laws governing the succession of forest trees; we find out what trees are hardy, and having settled this point, set out whatever kinds we fancy with the expectation of having them do well if they are cared for.

(3) Shall we plant the white pine in Michigan?

The answer may be given without hesitation. Yes; plant it first, and last, and all the time. Give it a fair chance and it will cover the State again. It may be wisdom to substitute some other species on those tract that have just been covered with a heavy growth of pine, but it is, to say the least, doubtful whether any such distinction need be made. If the white pine were planted in Michigan universally and everywhere where the land could be spared, it would find congenial soil enough even in those counties that have been most heavily covered with it.

Without discussing the value of other well-known species a few may be mentioned as specially worthy of planting in Michigan. The European larch, famous for the durability of its timber, and perfectly adapted to our northern climate; the *Ailanthus*, the only tree that has successfully controlled the drifting sand plains of southern Russia, and will perhaps be more valuable than any other on our own sand dunes; the *Catalpa speciosa*, of which specimens a foot and a half in diameter may be seen in Ann Arbor, and which, probably, may be depended upon for hardiness throughout the southern portion of the lower peninsula; the white ash and a long list of indigenous trees, any of which may be planted with every reason to expect a good return. The consideration of the large number of species, both indigenous and introduced, that may be successfully cultivated in Michigan is of great importance, but requires too much space for this article, and will have to be taken up in a separate paper, together with the consideration of the species best adapted to our sand-dunes, and the methods to be employed in planting them.

(4) Admitting that it is desirable that the planting of trees in Michigan should be undertaken at once and in earnest, what are the means of securing this and of ensuring the best results?

(1) The Legislature of the State may promote the work by offering encouragement to tree planting in the way of exemption of property from taxation. As to the form of legislation and its practical details, a careful study of the action of other States will furnish valuable suggestions. Of all State laws on the subject of tree planting that have come to my notice, that of Iowa has seemed preminently adapted to the purpose. The law provides that "for every acre of forest trees planted and cultivated for timber within the State, the trees thereon not being more than twelve feet apart, and kept in a healthy condition, the sum of one hundred dollars shall be exempted from taxation * * for ten years after each acre is so planted, provided, etc." Possibly other forms of legislative action on this subject may be found better, but that of Iowa has this very excellent feature, that it has very largely accomplished the object aimed at. We can profitably follow the example of Iowa, too, in securing the preparation and distribution of something corresponding to their "Forestry Manual," an unpretentious pamphlet of about thirty pages, filled with valuable information and practical hints on the subject of tree planting, and distributed gratuitously among the farmers of the State.

(2) The State ought also to be establishing facts upon which to base the future management of the great work of reforesting its waste lands. Two or three experimental stations, located in as many parts of the State, where trees of all sorts, both native and foreign, can be cultivated and the results recorded, would enable us in a few years to demonstrate the usefulness of some kinds and the unfitness of others for general cultivation. Meteorological observations carried on at these stations would give data for the solution of the difficult but important question relating to the climatic effects of forests.

(3) Very much depends upon the railroad companies, owning as they do, in the State of Michigan, lines aggregating over four thousand miles in length, with large grants of valuable land, they control, in a very great measure, the agricultural and commercial interests of large areas of the State. The Detroit, Mackinac & Marquette Railroad alone owns over 1,300,000 acres of land, and the Flint & Pere Marquette, the Grand Rapids & Indiana, and other lines are possessed of large tracts of both farming and timber lands. An abundant supply of wood for ties and manufacturing purposes is a prime necessity of all these lines, and may be secured by the prompt adoption of a liberal and enlightened policy in maintaining or restoring a suitable amount of forests on their lands. A number of western railroads, though obliged to contend with great natural disadvantages, have taken hold of this work with great enthusiasm, and several of them are now employing paid foresters to direct the work of raising and caring for forests along their lines.

(4) The farmers of the State have very much to do with the future of our forests, and, unfortunately, they have not yet, as a rule, taken a practical interest in maintaining or restoring them. There is, however, no class more ready to enter into undertakings that promise to be productive of good, and none more accustomed to meet and overcome difficulties. When the farmers of Michigan are once possessed with the conviction, that trees are often far more valuable than any other crop, and that they render the farm more productive and worth more per acre, trees will be planted.

(5) A few at least of the educational institutions of the state can do an important work by giving forestry an honorable place among the subjects of their respective course of study. Whether there is as yet a science of forestry in the United States or not, there will be before long, and intelligent and interested action on the part of such institutions will aid greatly in establishing the science, and in gaining for it the confidence and encouragement of both government and people. A beginning of this kind has been made at the University of Michigan, in connection with the School of Political Scieuce recently established there, and the lectures on forestry are attended by a class of about fifty.

(6) The general Government still owns something over a million acres of land in Michigan, and the State Government has yet large tracts of land under its control. If, instead of throwing this away, or selling it at the rate of $18 per 160 acres, any considerable portion might by auy means still be kept in permanent forests under Government control, and this control be exercised wisely and for the public good, as is done in the State forests of the Old World, forestry in Michigan would become an established fact. In some or all of these ways it is to be hoped that the great work of restoring the forests of the State may be accomplished.

Subscribe for the CANADA LUMBERMAN.

Chips.

THERE is an elm tree growing at Canton, N. Y., between seven and eight feet in diameter.

AT Palouse Junction, on the Northern Pacific railroad, W. T., there are piled 600,000 ties and 36 miles of rails.

SOME of the lumber camps in the vicinity of Port Severn are breaking up on account of the great depth of snow. It is about 3½ feet on the level.

THERE are produced annually in North America 100,000 barrels of hemlock bark extract, of which a single Boston firm produces 72,000 barrels.

A WEST Virginia farmer recently sold a single black walnut tree for $600, which was but little less than the sum he paid for the tract on which it grew.

A PETITION has been presented to the Manitoba parliament from vessel owners and lumbermen, praying that the mouth of the Red River of the North be dredged and lighthouses erected for the benefit of navigation.

THERE is a pine tree in Montgomery county, Mich., the owners of which are offering $140 to any party or parties who will deliver the butt log in Alpena. The tree is over nine feet in diameter, and it is thought to be largest tree in the state.

THE Montreal *Gazette* says:—Not only is there an enquiry from American markets, but we hear of orders being received from Winnipeg at good prices. The local market rules quiet, a fair business having been done in both hard and soft wood.

THE *Northwestern Lumberman* says that the Puget Sound Iron Company has 70 men engaged in cutting wood on the Sound, to be made into charcoal, and the force is to be increased to two hundred. Two-thirds of the men are Chinamen.

WE learn from the *Northwestern Lumberman* that a patent has been granted to Mr. Westman for a new method of erecting portable houses, designed for Manitoba. The inventor covers a round, wooden frame with rope made of prairie grass, and chemically made incombustible.

LOCUST is a valuable wood for many purposes, and is employed in heavy work on account of its strength and durability. It is used in shipbuilding and mill cogs largely. Locust fence posts are said to have been known to remain in the ground 60 years, continuing perfectly sound.

VERY few ties or other forest produce are being got out in Haliburton. The snow is too deep and the price too low. Cordwood is paying better. Sound two foot wood delivered in the village realizes $1.25 per cord. This is an artificial price, and is owing to the deep snow. There must be nearly four feet of snow in the woods.

GEORGIA exports over 300,000,000 feet of yellow pine annually. The principal exporting points are Brunswick, Darien, Savannah, St. Marys and Satella. Brunswick comes first with about 135,000,000 feet, principally resawn lumber. Darien's specialty is timber, of which about 100,000,000 feet was exported last year from this port. The balance was divided mainly between the other three ports.

A correspondent of the Montreal *Gazette* says lumbering seems to be the principal business of the people at Eaton Corner, clapboards, spruce logs, basswood and birch being $6 per 1,000 feet, board measure, at the Cookshire Mill Company's mill, and the company cannot saw the lumber nearly so fast as it comes in to their mill. The company have also contracted with a party up the river in Newport for 300,000 feet of spruce lumber, and with what they buy of individuals they will be able to run their mill to its full capacity.

NEARLY all the fine cabinet woods in general use are imported via New York and New Orleans, but there are many varieties of Australasian woods that do not reach New York, but are occasionally brought into San Francisco. Of these are the "prima vera" or white mahogany, the toa wood, resembling rosewood, and the manoa wood, all of which are very beautiful cabinet woods, but very expensive. They are somewhat used in California, but rarely find their way eastward.—*American Furniture Gazette.*

THE New York correspondent of the *Northwestern Lumberman* says in regard to eastern spruce that there is really no change to note. Some scattering cargoes are arriving. St. John, N. B., is likely to forward some supplies before long. But there is no demand just now to call for the moving of any large stocks.

M. FAVOL, a French investigator, has found that the creosote treatment for the preservation of wood sometimes doubles the durability of oak timbers used in colleries, but has little influence on pine. He further says that oak prepared with ferrous sulphate last 10 times longer than in its natural state. It should be immersed 24 hours in a solution of 200 grammes of ferrous sulphate.

THE prospective valve of southern pine land says the *Tradesman*, is well illustrated by two transactions recently made by Mr. Van Kirk, of Pensacola, Fla. At about the same time he sold 35,000 acres of Florida pine lands for $1.25 per acre, while for 110,000 acres of Wisconsin white pine lands, estimated to cut the same amount to the acre, he received $21 to the acre. Yet the Florida lands are as near transportation and as accessible as the $21 Wisconsin lands.

THE *Northwestern Lumberman* says that last season D. W. Goodenough handled nearly 5,000 cords of hemlock bark, at Ludington, Mich., and thereabout, and this year he expects the amount hauled by him will reach 6,000 cords. The larger portion will be gotten out along the Manistee branch of the Flint & Pere Marquette road, mostly in the township of Freesoil. Farmers clearing their land make a good thing on the bark, the stripped logs being clear gain.

MESSRS. JAS. AND WM. DEMPSTER, of Gananoque, are actively engaged in their lumbering operation in the Township of Canonto. They have a large gang of men and teams at work; and have now 15,000 standard pine logs ready to run out as soon as navigation opens. The timber is first growth and of best quality; the logs will be taken to Gananoque by way of Kingston. In addition to the saw-logs Messrs. Dempster Bros. are cutting a lot of other timber for rafting and railway purposes.

THE Singer Manufacturing company of South Bend, Ind., is making an immense amount of veneered work. At least two-thirds of the tables and cases turned out are veneered, the veneer being walnut, principally, and the basis pine. It is much the cheaper way, considering the high price of good walnut. Two thicknesses of pine are used, cross-grained in order to prevent splitting. Butternut and cherry are also used to some extent. The factory gives employment to 1,500 men.

A CORRESPONDENT of the *Northwestern Lumberman* writing from New Lexington, Ohio, says:—We had formerly good oak, poplar, walnut, ash, hickory, butternut, sycamore, chestnut, black oak, beech, birch, hard and soft maple, but now there is no lumber made to be shipped from here. D. C. Fowler has the only stationary mill in this vicinity, and it does not run more than a third of the time. There were formerly mills on all the creeks and runs with sufficient water, but they have all departed this life. Since the advent of circulars and portable engines, nearly every section of land has had one or more "sets." Timber has been recklessly destroyed, until Perry county is not a timber county, but large amounts of lumber are shipped in for building and fencing purposes.

TRADE IN THE STATES.

The Chicago *Northwestern Lumberman* says: The most marked feature of the lumber trade for the week past is an increased activity in the middle sections of the country, north of the Ohio and east of the Mississippi, with encouraging reports from the East and the heralding of good prospects at the West. The actual revival of demand in Ohio, Indiana and Illinois, wherein the long, hard winter has, to a considerable degree, let go its grip, is like a rebound from the extreme stagnation that prevailed after January came in. It is cheering, as showing that the actual demand for lumber is now, and gives prospects of being, large, and that the current requirement during the winter was simply arrested by the severity of the season. It is proof that much of the clatter about the shrinkage of demand on account of alleged hard times and forebodings of the future has had more sound than real significance, that the industries of the country are still expanding, that the mass of the people are yet prosperous, that real estate is being improved, railroads and manufactories built—in fine, that the progress of this great country at large has not been arrested, and that the consumption of lumber is going right on despite the lugubrious croaking of reactionists. While the foregoing is a fact, it may be, doubtless is, true that, in consequence of the prodigious output of lumber last year, there may be placed on the market this spring an aggregrate stock somewhat in excess of the immediate requirement, which may tend to cause prices at the season's opening to rule a little lower than they did last year. In fact, the decline in assorted yard stocks has already been felt, especially at the West. To what degree the value of bulk stocks will be affected by this weakness in the trade remains to be seen later on.

FELLING A REDWOOD.

In felling a redwood tree it is necessary to be careful to have the way cleared for it to drop, as the wood is so brittle that much of a shock is apt to break the trunk square off. The woodman will hold his axe like a plummet, and squint upward to ascertain how nearly perpendicular the huge tree may be, due allowance being made in cutting for any divergence therefrom. Logs are often dragged along to fill gullies, knolls must be levelled and stumps removed. Mortise holes are first cut in the trunk about four feet from the ground, into which iron-shod spring-boards, about four feet long and six feet wide, are fixed for the men to stand on while chopping at a height too great to reach from the ground. In this way the undercut is made, the strokes being made with great force and precision from the rather dizzy perch. In the neighborhood of an hour the choppers will reach the heart of a big tree, from which point new and more scientific tactics are adopted. The trunk must be laid exactly on a line with the course that has been cleared for it, to prevent injury to it. By very careful sighting and calculating, and masterly execution of plans laid out, the men are able to drop a tree right where they want it, to a dot, and seldom miss their mark, so great is the dexterity acquired. Measurement is made from the end of a lath pointed directly along the line where the trunk is to be laid, to each corner at each side of the undercut, and a little chopping is done to make the angles jibe. The mathematics of the case, though not especially complicated, are about sufficient to place a professor in his element. After the undercut is properly arranged, new mortises are made behind the tree for the spring-boards, and the overcut is made by a two-handed saw. The last few strokes are a delicate piece of business, the ax finishing the job, and the tree falls true and straight.

Salt and Woodwork.

It is a curious fact, says the *Carpenter*, that in the salt mines of Poland and Hungary the galleries are supported by wooden pillars, which are sound to last unimpaired for ages, in consequence of being impregnated with the salt, while pillars of brick and stone, used for the same purpose, crumble away in a short time by the decay of their mortar. It is also found that wooden piles driven into the mud of salt flats and marshes last for an unlimited time, and are used for the foundation of brick and stone edifices; and the practice of docking timber after it has been seasoned, by immersing it for some time in sea water, is generally admitted to be promotive of its durability.

Lumber Drivers' Calks

For Use in Stream Driving to insure a safe footing in Slippery Places.

25 in ball and 5 in heel are the numbers usually required.

PRICES for the six different sizes and for Calk Sets and Punches for adjusting Calks, on application to

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

Market Reports.

MONTREAL.

From Our Own Correspondent.

March 10th.—Owing to the state of the roads preventing much haulage, the spring trade is rather longer in opening up than what is usual aud we have no change to make ou our prico list. We hear, however, that dealers in Ottawa are asking higher prices for their lumber, but we have not heard of this being exceeded to, as stocks there are likely to be full and lumbermen are getting out logs beyond their expectations. The Americans are beginning to arrive and pick up suitable lots. We may state that although we do not change quotations, prices are very firm as under, ex-yard :—

Pine, 1st quality, ℔ M	$35 00@40 00
Pine, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00

CORDWOOD.

Trade has been pretty active during the past two weeks and stocks are ample for all requirements as both the Q. M. O. and the G. T. Railways are bringing in large quanties of fino long wood. Prices have a downward tendency and some of the dealers are accepting a shade under our quotations—the market being decidedly weaker. We quote at railway stations :

Long Maple	$ 7 50
Short "	7 00
Long Birch	7 00
Short "	6 00
Long Beech	6 50
Short "	6 50
Long Tamarack	6 00
Short "	5 50

OTTAWA.

From Our own Correspondent.

March 9.—There is one class of tho community who takes little stock in Wiggin's storm, and that is—the lumbermen. While tho prophet has issued his fiat advising those interested in shipping and other business pursuits to keep "close to the shore" from the 5th to the 11th instants, he has not said anything of tho lumbermau. Perhaps there was no necessity, as the hardy hewer of our forests is quite safe from the disastrous elements.

There is little of importance to announce concerning the trade this month. Everything is progressing smoothly in tho limits, and a good season's cut will be the result. There is every prospect of the output this year being fully as large, if not larger, than last season.

As yet this session there has been little legislation in the Commons concerning the lumbering industry.

Messrs. Hugo B. Rathbun, Edward Wilkes Rathbun, and Fred. S. Rathburn petition Parliament to be incorporated as a company to bo known as "H. B. Rathbun & Sons." Tho powers asked for are to carry on in Canada, Great Britain, the United States and elsewhere, the business of general merchants, including the sale of lumber and timber, general manufacturers, ship and vessel owners, etc. The principal place of business of tho company will be Deseronto.

G. H. Nichols and Charles Kyto, of New York, A. F. Riddell, of Montreal, W. A. Allen and J. H. Haycock, of Ottawa, ask for incorporation as the "Dominion Phosphate & Mining Co." Capital stock will be $150,000. Head office will be in this city.

NOTES.

Mr. Oliver Latour, a well-known lumberman of this city, has gone to Winnipeg on a business trip. He is interested in certain limits in Lako of the Woods district.

The improvements going on at the mills here this season are more extensive than in previous years.

The last heavy fall of snow on the Upper Ottawa has interfered considerably with work in the shanties.

TORONTO.

From Our Own Correspondent.

March. 10.—Business at the various yards is in a fairly prosperous condition and most of the dealers seem to be in the best of humor, and are looking confidently to the opening of the spring trade, which will undoubtedly be good, should no unforeseen circumstances arise in the meantime to mar the present prospects. Last spring the prospects were just as promising up to the time of the carpenters strike, and should the bricklayers take tho same course this season, which has been threatened during the last week, the same lamentable results will certainly bo the outcome of of such a suicidal act.

The continual blocking of the different railways leading into the city is keeping lumber back, so that the wholesale trade by car-loads is nearly at a stand still, and our harbor is tightly blocked up with ice, the prospects for the early opening of navigation being extremely doubtful which will certainly tend to strengthen prices, on early shipments, at least. By my quotations this week you will notice that prices on some grades have stiffened, and remain firm on all grades of lumber.

BOSTON.

Cotton, Wool and Iron of March 10, says :—Considering the exceedingly unfavorable weather, trade is moving along quite encouragingly and is gradually improving. There are further indications that spring business will be of very good proportions, including new building operations in the city, suburbs, and in fact all around. The northern mills that supply house frames are quite busy on orders. Advices from down east are that the winter has been very favorable for logging operations. Shingles begin to be called for. Western lumber is in considerably broken stock in first hands, and trade is looking up. Black walnut of the best grades is in good enquiry, and the best oak, ask and cherry are particularly in request for furniture work and inside finishing. Yellow pine continues very quiet. Flooring of the best quality is well sustained, but seconds are rather slow. Timber is dull.

CHICAGO.

The *Northwestern Lumberman* of March 8, says :—The demand for lumber has generally improved since the beginning of March, under the stimulus of requirement for early building purposes. The severity of the winter past checked building all over that portion of the country subject to snow and frost, so that as soon as the weather moderated building was resumed with considerable activity, in order to make up for lost time. The disposition to purchase is encouraged by the inclination of holders to work off as much stock as they can in the shortest possible space of time. This motive to crowd sales arises from the winter having been unfavorable to building and trade, so that stocks have not disappeared from the yards to that extent which was reasonably expected. The dealers find themselves in possession of more lumber than they desire at this season, and the natural consequence is an urgency to sell. This disposition is indicated in reports from Buffalo, Toledo, points in Michigan and Wisconsin, and is very marked in this city. There is a widespread and general feeling that there is a greater surplus in supply than is good for the health of prices. At the same time thero is no doubt that the volume of demand will be heavy for the season to come.

Receipts, and stock on hand of lumber, shingles, etc., for the week ending March 8, as reported by the Lumberman's Exchange :

LONDON.

The *Timber Trades Journal* of Feb. 24, says : This market is exceptionally dull, and there seems to be little or no animation anywhere. Nobody seems to want anything, and though sales for early shipment have been made here and there, they are, we understand, on a very limited scale in comparison with the transactions of former years. The auction sales just at this period are relied upon by dealers here to keep them supplied, so that we are hardly surprised to see some dullness pervading the metropolitan import trade, but the measure of flatness that has been reached at the present time has hardly a parallel.

That a revival of business throughout the country will sooner or later take place we have very little difficulty in believing, and the wood trade will be certain to share in the general reaction. The present position of importers is not unfavourable to such a view, and though unquestionably the inclination is to hold off rather than to buy at the present quotations, there is not the slightest doubt that the spring consumption will reduce the stocks here to such an extent that the trade will be forced to come into the market to secure what they want. The outports cannot long sustain an attitude of indifference, and though the London buyers can resort to the public sales, there is not the same source of supply open to the provincial merchant. Liverpool and Bristol hold auction sales of considerable importance, but that they have anything like the influence on the local markets that the Baltic sales here have, we cannot for a moment suppose. The London dealers, whose operations are chiefly confined to the public sales form such an important branch of tho trade that they could almost keep the metropolis supplied, depending on the auctions exclusively for their requirements. This could not be done at any other port but London, the frequency and magnitude of the public sales being quite peculiar to itself.

LIVERPOOL.

The *Timber Trades Journal* of Feb. 24, says : The arrivals continue very light, and consist chiefly of oddments from the United States, such as parcels of oak wagon scantling, which by the way, are the most important of all, and sundry consignments of walnutwood staves, and other similar goods. The steady demand which was noted as being a characteristic of the present condition of trade still continues, and there seem to be a fair amount of timber and deals of nearly all descriptions going into consumption. When the statistics of the present month are issued, it is very probable that a fair, if not a good, consumption will be found to have marked the present month.

With the good dividends recently paid by the leading lines of railway we may, perhaps, hope to seo some increased liveliness in the waggon building trade, if the directors desire to improve the condition of their rolling stock, and if they should decide to do so, then they could not seize a better opportunity than the present, when American oak wagon scantling is at such a low price as it figures to-day, when compared with the cost of producing the samo dimensions either from Baltic or Canadian oak in the log.

GLASGOW.

Tho *Timber Trades Journal* of Feb. 24, says : Business has been quiet during the past week, and only one cargo imported, consisting of pitch pine from Pensacola. Deliveries have been going on to a fair extent. Of deals (chiefly Canadian) there have been delivered from Yorkhill Yard here, since the beginning of the year, 112,000 pieces, being about the same quantity as for the corresponding period last year.

Messrs. Allison, Couslaud & Hamilton held a public sale at Greenock on the 15th inst. Transactions were limited, a good deal being withdrawn by the brokers, as the prices offered did not meet their views.

The sales were as follows :—

Quebec waney boardwood—			
60c. ft. av. per log		2s. 2d.	per c. ft.
Hewn pitch pine (slightly bent)—			
90 c. ft. av. per log		1s, 2d.	"
Prime sawn pitch pine—			
25 & 30 c. ft. av.		1s. 2d. & 1s. 2½d.	"
Bangor, N. S. spruce deals—			
12 & 13 ft	9×3	11d.	"

WINNIPEG CONTRACTS.

A Winnipeg correspondent says that last year the city of Winnipeg purchased about 3,500,000

feet of lumber. It cost $30 per 1,000 feet, for lumber up to 16-feet pieces ; and $1 per 1,000 for every foot beyond that size. The supplies were obtained from city lumbermen. The council decided that this year all supplies should be purchased by tender and contract. Tenders for lumber were called for. About a dozen were put in. They were opened and considered by the board of works recently. Several of the tenders were from United States firms. The prices ran from $24.48 to $31.50 per 1,000 feet. The contract was awarded to Wood & Co. at $25.88. An accepted cheque for $2,000 accompanied the tender. The next highest tender was put in by J. G. Macdonald for $25.-95. Supposing that the city will use about the same quantity of lumber this year as was used last year, it will save $17,500 by the tender and contract system. It is understood that the successful tenderer is or was a member of the firm of McBain, Wood & Company, and that the lumber to be supplied will be brought in from Quebec via the Thunder Bay route. The contract is an important one, inasmuch as it shows that lumber is going to be $5 per 1,000 cheaper this year than it was last. If it can be brought from Quebec and sold to the city at $24.88, it can also be sold to the general public at as cheap if not a cheaper rate.

EFFECTS OF STORMS.

We learn from Aberlour, Banffshire, that great destruction of timber was caused by the gale of Tuesday week. On Drum of Carron, from eight to ten acres of pine trees were levelled with the ground. On the Knock of Allachie, belonging to Mr. Duff, of Aberlour, several hundreds of fir trees were uprooted. Very many of these trees are broken, some through the middle, others at the bottom, and they lie sometimes in heaps of half-a-dozen, tumbled and twisted above each other. They are mostly the best and largest trees that have fallen. At Ballindallock the gale was of unusual severity, commencing on Tuesday night and continuing unabated till noon on Wednesday. It was considered by many to be worse than the storm on the night the Tay Bridge fell. The woods have suffered most damage. Many fine trees have been uprooted or broken across in the most exposed parts of the woods at Phonas, and Drum of Carron. In the Drum Wood, which belongs to Mr. H. A. Grant, of Elchies, many acres of timber are uprooted. The farmsteading of Greenmoss, occupied by Mr. Ellis, which was thatched with straw and heather, was on one side clean stripped to the rafters. The stackyards came in for considerable loss. Many stacks have been turned over and scattered in every direction. Wooden erections suffered a great deal of damage.—*Timber Trades Journal.*

A Good Old Miller.

A New Jersey Miller, who had become old and rheumatic, one day called his sons about him, and said: "Boys, I am growing stiff in the knees and faint at heart. My liver is out of order, and I can no longer distinguish between a peck and a half bushel when taking toll. This mill is worth ten thousand dollars. In order to form a stock company, and render my own burdens the lighter, I shall give Reuben two-tenths, Samuel the same, and Henry, who is my first born, three-tenths. Bless you, my children, bless you. You may go fishing for half a day." The three sons took the papers which the old man had made out, and instead of going fishing they went down to a lawyer's office, called a meeting of stock-holders, and proceeded to business. The first-born was elected president, Reuben treasurer, and Samuel secretary, and the following resolution was passed: "*Resolved*,—That we bounce the old man, and run the mill after our own ideas !"

The above from the *Millers' Review* (Philadelphia), illustrates substantially the experience of a good many indulgent, confiding fathers. Some that read this will be reminded of like cases that have come under their own notice.—*Scientific American.*

The Dismal Swamp.

The Dismal Swamp in Virginia is much reduced in extent compared to what it was twenty years ago. It now contains, says a rocent visitor there, some of the best farming land in the State. A railroad runs across it, and it is on its way to final extinction. The drainage of Lake Drummond, a central body of water lying higher than the average level of the swamp, would make the whole area fertile. This is a project of Gov. Benjamin F. Butler, who once had surveys made, but at length abandoned it. The one great industry of the swamp is lumbering. It is penetrated by small ditches in connection with larger canals, and by rude tramroads, over which the logs are hauled to be sawed up into shingles, railroad ties and fencing. The lake, however, with its fringe of cypress and its projecting roots and stumps, is just as dismal as ever.—*Scientific American.*

THE PROSPECTS.

The Chicago *Lumber Trades Journal* says:—A representative of this journal, in rambling through the country during February, picked up considerable information relating to the condition, actual and prospective, of trade. The opinion among the dealers in whatever town his curiosity led him was emphatic in the belief that a large and profitable trade would open up in the spring, extensive building would begin at the earliest favorable period to pursue work, and the improvements, especially among the farmers, would assume large proportions. The northern part of this state will unquestionably witness, in every line, a marked progress. Along both the Chicago, Burlington & Quincy and Northwestern railroads the dealers are sanguine of a very satisfactory trade. Stocks are not what might be called good upon these lines of travel, for in view of a severe winter the dealers hesitated exceedingly, and did not put in big stocks in the fall, because of the uncertainty of how long they would have to carry them. The weather throughout the country has been very severe and trade amounted to but little in consequence. In Iowa and Nebraska it is stated that the building operations will exceed anything heretofore.

CLOTHES PINS.

The Newmarket *Era* says:—Nearly all the machinery taken to the temporary saw-mill on the 5th of East Gwillimbury last summer by the Messrs. Cane, has been brought back to the mills here this week. It is intended to commence next week at replacing it ready for spring work. There are now over 27,000 logs in and about 200 are yet to come in, but the teams are busy just now in hauling clothes-pin and pail timber. The new dry kilns are now complete and working like a charm. The pail-timber is sawn the proper length and shape and is piled in cars capable of holding 370 cubic feet. There are twelve of these cars, and as soon as one is filled it is shoved into the kiln and another, now dry, taken out of the other end worked up, thus having ten cars of stuff drying all the time. A large wooden chimney, about 40 feet high, has been erected at the back of the building which causes a constant circulation of hot air through the entire kiln, the heating of which we have aluded to. One of these carloads is manufactured into pails and tubs, and another car filled with green material, every day. This kiln is built especially for this branch of the trade and is independent of the other dry kilns. The manufacture of clothes pins is attaining considerable proportions. They are now making, ready for shipment, about 30,000 per day, out of beech, birch, and maple wood. Each pin passes through seven machines before being dried and packed. The firm have already gained the reputation of making the smoothest and neatest pin in the Dominion.

SHADE TREES ALONG THE CANAL.

The St. Catharines *Journal* says:—Mr. Ellis, superintendent of the Welland canal, proposes, during the coming spring, to plant a number of shade trees along the banks of the canal. The idea seems to be an excellent one. While a general tree planting will add considerably to the scenic effect, a much more important and practical feature will be the advantage to the canal banks. In many places the banks being more or less exposed, the planting of trees will be of advantage by holding the soil by reason of the roots permeating in every direction.

JONES & SON,

Wholesale Lumber & Timber Dealers

39 Broadway, NEW YORK.

Oak, Ash, Cherry, Black Walnut, Poplar, Butternut

And all other Kinds of HARDWOOD LUMBER.

White and Yellow Pine Lumber and Timber.

Oak Ship Plank and Timber. Pine Deck Plank and Ship Stock Generally.

L7

During the past summer a few willow trees were planted in the neighborhood of some of the locks; but the number was very small. We are glad to see that Mr. Ellis has contrived to have a good deal of very necessary work accomplished along the canal that was much needed. A great many exposed places at the approaches to locks and bridges have been securely fenced, so that there can be little danger of accidents occurring at these points. Had this work not been done there can be little doubt but sooner or later some serious accidents would have taken place.

PLANTING THE PRAIRIES.

The *Lumberman's Gazette* says:—The question of whether forest trees will or will not grow on the prairies of the American Northwest is being warmly debated in connection with the bill introduced into congress setting apart a quarter of a million acres in Dakota for the cultivation of trees. The assertion having been made that owing to the long-continued droughts trees could not be successfully grown in Dakota west of the James river, Mr. Leonard B. Hodges, of St. Paul, replied as follows in an address delivered before the Minnesota State Horticultural Society: "The fact that within the last ten years hundreds of groves, containing millions of healthy, vigorous young forest trees, are now growing far out in the treeless region, where science had preordained and doomed the work an impossibility, must be acknowledged. The fact that young groves of forest trees are now being successfully grown on the line of the Northern Pacific Railroad, away out and beyond the 100th meridian, has also to be admitted, science and its votaries to the contrary notwithstanding."

Saginaw District.

EAST SAGINAW, MICH., March 6.—There is plenty of snow in the woods. The days are mild and the nights cool. Roads are in good condition, and logging is progressing as favorable as could be expected. There is some crust to the snow, and the conditions for cutting and skidding rapidly are no better than before the thaw settled the snow. It is estimated that in neighborhood of 90,000,000 feet have already reached the banks of the Rifle river. Reports from other streams do not differ materially from those I sent you last week. The Flint & Pere Marquette railroad is hauling large quantities of logs, the quantity for January exceeding 16,000,000 feet. S. R. Hall has gone to his camps on the pine river for the purpose of discontinuing operations. He has secured 9,-000,000 feet this winter.—*Northwestern Lumberman.*

The Cow Tree.

Sir Joseph Hooker, in his report on Kew Gardens, gives a sketch of a most interesting botanical curiosity, the *Palo de vaca*, or cow tree. This tree grows in forests at the foot of certain mountain ranges in Venezuela, and attains a height of 100 feet, and frequently the trunk reaches to 70 feet without a branch. The remarkable characteristic of the tree is the milk which exudes from the truuk when an incision is made. The flavor is of sweet cream with a slight balsamic taste, but it is very wholesome and nourishing, the composition being said to approach very near the milk of a cow. From the fact that the milk is somewhat glutinous it would seem that the tree is of the caoutchouc order. Seeds which have been sent to Bombay and the colonies are said to be thriving well. It is noteworthy, as an example of the law of compensation traceable in nature generally, that this cow tree seems originally to have been a native of a country where milk giving animals were formerly totally unknown.

AN Ottawa despatch says:—Shanty teams are returning to the city in droves. The weather has been unusually advantageous for a good cut. The entire cut in the Kippewa district has been got out to the streams ready for the drive.

SHERRY, JERRY & Co. are constructing a logging railroad from Vesper, Wood county, Wis., four miles northwest to the extremity of their pine tract. They have received the steel rails and a locomotive, and will push the work to completion. A contemplated road from Centralia to Vesper would connect with the road being constructed.

HUNDREDS of thousands of cedar hop-poles are being shipped from Canada into New York, mostly by way of Ogdensburg, whence they are shipped iuto the central part of the state by way of the Rome, Watertown & Ogdensburg road. The high price of hops this has stimulated this industry, and every man who owns a second-growth cedar grove has a bonanza.

THE Chicago *Northwestern Lumberman* says: The new treaty with Mexico, whereby numerous manufactured articles are to be admitted into that country from this free of duty, in reciprocity for a like privilege on the part of the United States, will permit the admission of ready-made houses of wood or iron free. This gives another opportunity for the "knock-down"-house business.

THE Fall Mountain Paper Company is erecting at Bellows Falls, Vt., a large furnace t burn waste wet chips and bark from the wood-pulp mill, which are first compressed in a hay-press. By the applicatiou of hot air above the fire an intense heat is secured, aud the claim is made that the plan of boiler adopted will produce double the quantity of steam than can be made where coal is used for fuel. The company has 29 furnaces in its different mills.

MICHIGAN LUMBER.

MARQUETTE, MICH., February 27.—Since my last report we had several falls of snow. On Sunday and Monday over one foot of snow fell, and the drifts were so bad trains were not run on the Detroit, Mackinaw & Marquette railroad. Skidding is almost out of the question. It costs about all logs are worth to get them on the skids. It is impossible now to get the quantity anticipated last fall. I think the shortage will be fully 20 per cent., and probably 5 per cent. of this deficiency will be put in by summer logging. The Vulcan furnace is finished at Newberry. It is a very large establishment, and said to have cost $250,000. The charcoal will be made by a new process in retorts, instead of the old-fashioned way. This company has built a saw-mill in connection with the furnace, and intends manufacturing all the best maple and birch into lumber, putting the refuse and poor logs into charcoal. Two miles further west, at Dollarville, the American Lumber Company has built a first-class mill for pine, which will be ready for sawing in a month, Quite a large business village has been built up since last fall. Business is being pushed lively, and this point promises to be of some importance at an early day. Tho mill will cut about 14,000,000 feet, and a full stock is being got out. Seney is another lumber village of importance. The Chicago Lumber Company, Ayer, Smith & Co., Perry & Pearson, and Hewet all have offices and warehouses here. This will be the centre of an output of about 40,000,000 feet of lumber this year. The outlet is by Fox and Monistique rivers to Lake Michigan. Perry & Pearson have four camps 30 miles up the line, the product of which is railroaded and dumped here into the Fox river. In the vicinity of Marquette the mills of Fraser, Gillett and the Eagle Mills are all running this winter, principally on bills for the mines. Men's wages still keep high—about $30 a month.—*Northwestern Lumberman.*

THE SWEDISH TRADE.

The Stockholm correspondent of the *Timber Trades Journal* says:—The languor which has been observable in the f.o.b. trade from the north of Sweden has only very partially disappeared, and unusually few sales have been made up to date. Fair-sized lines of best redwood goods have been disposed of to Hull and Grimsby, as well as to north French ports, while considerable quantities of goods have been sold to Channel ports, notably Poole. Notwithstanding all this, however, importers are acting with an amount of caution, and showing a disinclination to purchaso, that was was scarcely expected two or three months ago. Unless stocks abroad are much greater and the prospects of trade considerably worse than anticipated, this state of matters cannot be expected to continue much longer.

The weather has lately been favourable for getting logs out of the woods, and, in spite of the quantity of snow that has fallen, appearances would seem to indicate that an average "get" will be obtained, although at a somewhat enhanced cost. Sawing has commenced for the season at many of the principal mills, with an ample log supply for the early part of the year.

NORTH CAROLINA FORESTS.

An enthusiastic writer says:—"The white pine is confined to the mountain and Piedmont, or western part of the state, in great abundance in some counties, and of enormous size—more than three feet in diameter, and 100 to 150 feet high. The oaks excel in variety and species, in extent of distribution, and predominate in two-thirds of the state, middle and western. The white oak, a species called post oak, is much valued on account of its strength and durability. Large exports are made to England in the form of staves and ship timber. Red, black and willow oak are very abundant in the middle and western districts, and grow to an immense size, while live oak is confined to the eastern section. Seven species of hickory abound, and are distributed over nearly overy section of the state, and are of great size. Being one of the most dense, rigid, heavy and durable of timber, it is said to have become recently in great demand, and shipped for manufacturing purposes to Europe, California, Australia and other mining sections. Black walnut is abundant in the middle and western sections. The chestnut is one of the largest and oldest trees, sometimes 10 feet in diameter and 80 feet high, found mostly and abundant in the Piedmont and mountain sections. Poplar is one of the largest and handsomest of trees, attaining the greatest size in the mountain counties. It is largely used for building and other domestic purposes as a substitute for pine. Cypress abounds in the lowlands of the east, and it grows to a great size. Tho ship-yards of New York and Philadelphia attest the use of 20 kinds of timber, all of which, and more, grow in North Carolina, for the most part easy of access, and facilities of transportation becoming more convenient, in proportion as these vast, valuable resources are largely developed."

MIRAMICHI PINE DEALS.

A correspondent of the London *Timber Trades Journal* says:

SIR,—I was very much surprisod to see in your last paper a serious charge brought against the port of Miramichi for shipping bad deals—bad in their nature; for what can be worse than a predisposition to rot, of which the production of fungi is a certain indication?

I have always esteemed Miramichi pine as second only, if second, to Quobec, and by some it is even preferred. Nor did I ever before hear of this tendency to sudden decay, which your correspondent "Lignum" ascribes to it, till I saw his letter in your *Journal.* Perhaps he will be good enough to let us known where this phenomenon, peculiar only to Miramichi pine deals, can be seen, in contrast with some other deals equally ill-piled—that is, with insufficiency of air, and standing equally long in the same state.

It is not a light matter to affix a stigma of this kind in your widely circulated paper upon a shipping port that has herctofore, as far as my experience goes, maintained an exceptionally good repute. "Lignum" boldly affirms that Miramichi deals *do decay more rapidly than those from Quebec.* In the name of the shippers of Miramichi, I challenge him to the proof. He speaks with *authority*, and we call on him to show whence it is derived.

Trusting that you will give this letter also a place in your columns,—I am, Sir, your obedient servant,

AN OLD IMPORTER.

London, 15th February 1883.

HEMLOCK OPERATIONS.

A correspondent of the *Northwestern Lumberman* says:—In reading the *Lumberman*, I frequently see accounts of lumber operations east and west of us. It may be of some little interest to known that this section of country adds somewhat to the annual lumber production. The Sargeant Lumber Company, with mills at Sargeant Station, on the Pennsylvania & Erie railroad, sawed the past year 6,000,000 feet of hemlock and about 350,000 feet of cherry; the sale for this production being found in eastern Pennsylvania, New Jersey, Maryland and Delaware. The cherry timber is being rapidly cut from our forests, and few, if any, choice orchards of it can now be found in this section. This company carries about an average stock of 1,000,000 feet of hemlock, and, owing to the heavy demand, has been sawing all winter. The company has banked at the mill about 1,000,000 feet of hemlock logs and 250,000 feet of cherry logs.

Soon the woods will again resound with the woodman s axe and bark-peeling will begin. The large amount of hemlock bark peeled last year weakened the price of bark considerably, many, and, in fact, nearly all the tanners, putting in heavy stocks of bark. We do not think there will be as heavy a slaughter of bark this season. We have had an excellent winter for logging, with snow about three feet deep. The recent rains seemed to have no preceptible effect on the snow, but to-day's sunshine, with a warm wind, is making it disappear rapidly.

We are located near the summit of the Allegheny mountains, and are surrounded with heavy forests of hemlock, which is growing into a heavier demand on its merits for buildings, etc. It is noticeable that quite a quantity of it finds a market at the summer resorts along the sea shore—Cape May, Long Branch, Atlantic City, etc.

SPRUCE IN ENGLAND.

The *Timber Trades Journal* says:—An improved feeling is said to have ruled during the past week in the spruce markets, and the downward tendency of prices, we are told, has been slightly checked. The fall in the value of spruce was so sudden that an early recovery was, under ordinary canditions to be expected, and although for several reasons it is hardly likely that figures which ruled last autumn will be fully recovered during the spring months, yet a slight advance above present quotations may be perhaps experienced. Selling brokers are said to have had, during the last fortnight, plenty of inquiries from the west coast, and transactions in connection with spruce have, of late, been of a more lively character than with any other classes of wood goods. We believe, however, that in consequence of the heavy deliveries of spruce deals, which occurred on the arrival of the fall fleet, the inland stocks have been fully replenished, and that quite an average weight is held by consumers, and stored at the various wharves and railway depots inland.

It would seem that the spruce markets every year more and more effect the value of other kinds of whitewood, and indeed they effect in some parts of the country to a limited extent the commoner qualities of redwood also. Any improvement, therefore, which may occur during the next few weeks in connection with the value of spruce will be closely observed, and the holders of large stocks will, doubtless, read with ready satisfaction any notes indicating an existent or coming improvement.

WOODS AND FORESTS.

The following is the official statement of revenue collected during the year ending 31st December, 1882, as taken from the annual report of the Ontario Crown Lands Commissioner:

Ottawa Timber District.		
Collected at Ottawa	179,612.93	
Collected at Quebec.....	62,563.28	
		242,176.21
Belleville Timber District.		
Collected at Belleville & Department.....	112,773.74	
Collected at Quebec.....	2,590.99	
		115,364.73
Western Timber District.		
Collected at Department.....	111,630.63	
Collected at Quebec.....	13,568.92	
		125,199.60
		482,740.54
Collected on sale of Limits, of 6th December, 1881.....		411,311.65
Total		894,052.19

Albany Stocks.

Bradstreet's is authority for the statement that the total stocks of white pine lumber on hand at Albany, Jan. 1, 1882, amounted to 96,917,829 feet, and on Jan. 1, 1883, to 101,258,685 feet. The total sales of white piue during the calendar year amounted to 252,673,700 feet. The receipts were 453,932,358 feet. The stocks of Norway pine increased from 1,077,260 feet, Jan. 1. 1882, to 2,988,072 feet on Jan. 1, 1883, the sales amounting to but 311,010 feet during the year, and the receipts to 3,269,082 feet. The total sales in 1882 "of measured and tally lumber" amounted to 440,400,227 feet, and the aggregate of stocks on hand Jan. 1 last was 112,256,938 feet against something over 106,000,000 feet on Jan. 1, 1882, a gain in stocks ou the year of about 6,000,000 feet.

Spruce Beams.

Experiments have proven that spruce beams, loaded from one-half to two-thirds their breaking strain, finally break after a long and steady deflection, which continually increases until the final rupture occurs. If substantiated by additional experiments this fact will, the *United States Miller* believes, go far towards explaining the frequent falling of mill and warehouse floors, under loads supposed by the builders to be perfectly safe. The floors of all such buildings, says the journal referred to, should be sufficiently strong to carry at least three times the weight that can by any possibility be put on them, and at least five times as strong as the ordinary load. When there is running machinary in the building, which is likely to produce jar or tremble, these figures must be exceeded—according to the same authority—as the effect of a continuous jar or strain combined is very destructive to the building in which they are found.

A BIG PLANER.

A Maine paper says that in one of the Bath ship-yards is a planer, said to be the largest in the world. It is capable of working a piece of timber 66 feet long. five feet wide and two and a half feet deep. The keel comes out of the machine ready for laying on the blocks, and perfectly smooth and true on all sides. A beveling saw is another capacious machine, which turns out timber sawed at any desired angle from the horizontal, and by it curved timber and ship-knees can be worked true to a line. The steam engine which runs these machines runs also a bolt-cutting machine which will nip off round iron of any diameter up to two inches; also a large and small circular saw, a machine for making tree-nails, and, in the finishing shop, a band circular saw, a planer, moulding machine, and a plug and wedge machine. The waste steam is used in bending timber.

North West "Pine."

The Chicago *Northwestern Lumberman* says: The *Lumberman*, in a recent issue, mentioned that Mr. Louis Sands, of Manistee, Michigan, had made a large purchase of pine in the Cypress Hills, in the Northwestern Territory, Canada. A Canadian correspondent seeks to make a correction, and states that there is not a pine tree between Winnipeg and the Rocky mountains, north of the forty-ninth parallel of latitude. He knows there is not, he writes, for he has traveled over that country. Mr. Sands calls the timber cypress pine, and says that if it is not pine it will at least sell for it, and answer the purpose. It lies between the forty-ninth and fiftieth parallels of latitude. A specimen of the wood is in this office, and while it does not have the exact appearance of white pine, it is timber of very fine quality, and undoubtedly, as Mr. Sands says, "will answer the purpose."

A Deferred Investment.

The Stockholm correspondent of the *Timber Trades Journal* says:—A very extensive purchase has lately been effected, by a consortium here, of growing timber along the East Dal River, a few miles above the Siljan Lake. The purchase is estimated to cover over 1,000,000 mature trees, and the price is understood to be reasonable. The timber, however, will not be available until somewhere about, 1890 the Government survey of the forest, preparatory to its division amongst those entitled to the same, being yet incomplete. This purchase is a proof that capitalists have an abounding faith in the future of forest property and the products obtained therefrom, when they are prepared to wait eight or ten years before they get even a partial return on the capital.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily, and honorably. Address TRUE & Co., Augusta, Maine.

THE RE-AFFORESTING OF IRELAND.

The *Timber Trades Journal* says:—With reference to Dr. Lyons' plan for re-afforesting the mountain sides and other waste lands in Ireland it appears from a contemporary that the forestry accounts for Prussia were recently published at Berlin, and since that time there have been issued in England two consular reports relating to the same species of property in France and Bavaria. It appears that in Prussia there are about 7,000,000 acres of State forest, about 11,000,000 acres of woodland owned by private persons, and about 2,000,000 acres managed by the local corporations. Very little of this is planted with anything except pine, fir or beech, and almost the whole extent is cropped according to the strictest rules with a view to profit. The net return per acre, taking the State forests and private properties together amounts to about 3s 7d., which is made up by deducting 4s 2d., as the cost of culture, cutting and carrying, from the gross return of 7s 9d. produced by the sales of timber. In Bavaria the State forests cover considerably more than 2,000,000 acres, and the gross return is rather under 23,000,000 marks, or almost exactly 10s. per acre. the expenses come to 13,000,000 marks, or 5s 8d. per acre, leaving a net profit of 9,750,000 marks, or 4s 4d. per acre. In France the forests form an important part of the public domain, yielding more than two-thirds of the total revenue derived from it. The net annual profits may be set down at an average of a million and a half sterling; but then a large part of this sum, especially since the fall of the Empire, has been made by letting out the forests by auction for sporting purposes.

Now we do not consider that the small annual return per acre of forest lands offers any discouragement whatever to the scheme of Dr. Lyons, for the replanting of a tract of country now producing nothing and affording no employment to the native inhabitants of the land is quite a different thing from commencing public works, with a view to give people temporary occupation, such as the building of a pier, a court-house, a jail, or a workhouse, because these attract workmen to the neighborhood, who when the buildings are finished often encumber it with additions to a population which was already too great for the means of living to be obtained thereabout. But the planting of lands, with a view to profit, would be a source of perpetual employment to the laborers once engaged in it, in a cheery and healthful way, a kind of life which is denied to the weavers and spinners of Manchester, except when a brief holiday gives them a chance to sniff the fresh air of the country. Bare plains and bleak hill-sides, not affording a rag of shelter now for man or beast, would soon become fit for human habitation, and under the forest screen little clearances might be made, and cottage homes erected, which would tend to diffuse peace and contentment through a whole district. A vivid fancy might conceive many pleasant rural combinations arising therefrom, and some future Gray, who had visited the region in its forest glory, might exclaim:—

"How jocund did they drive their team afield,
How bowed the woods beneath their sturdy stroke!"

But we have to deal with facts, not poetry, whose essence is fiction, and since we have taken up the subject we have seen it stated that the Russian forests do not return above 1½d. per acre per annum to the Government. Possibly the Czar is satisfied with them if they support a contented peasantry, though they contribute so little to his exchequer.

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and **Account Books** of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

Books taken out in parts, **Bibles, Works of Art, Illustrated Works, Music Books, Magazines, Perodicals** and **Newspapers** bound in any style desired.

Old Books, Albums, &c. Repaired and Rebound.

Maps, Pictures, &c. Mounted and Varnished.

Names Lettered in Gold Leaf on Presentation Books, Bibles, Purses, &c.

THREE FIRST PRIZES FOR BOOK-BINDING AT THE CENTRAL EXHIBITION. { TOKER & Co.

EXAGGERATED ACCOUNTS.

The *Northwestern Lumberman* says:—There is still considerable afloat about straw lumber, and some of the facts are highly exaggerated. Some of the newspapers catching up the oft-repeated statement about the invention are inclined to claim more for the article than the manufacturers of it would care to claim. One of the points that seems a little mixed is the assertion that it will enter into competition with wide walnut lumber, at about one-half the price of the latter. It has not been shown that the product is much of a competitor with walnut, while it costs much more. Referring to the price-list of the company making the straw lumber, it is seen that the cost of a thousand feet is at the rate of $10 per ply for three ply and under, and $8.50 for four-ply and over, the ples running one-sixteenth inch in thickness. Reckoning 16 plies for inch thick, at $8.50 per ply, the result is $136, which would buy a fair grade of counter tops, or 2,000 feet of firsts and seconds. It is well enough to let straw lumber stand on its own merits, without getting beyond the bounds of facts and probabilities.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

LITTLE BY LITTLE.—The constant dropping of water will wear away even the hardest stone. So the constant irritation of a cough will so wear upon the lungs as to induce incurable Consumption. Hagyard's Pectoral Balsam will cure the worst cough, speedily and effectually.

FORTUNATELY Valvular disease of the heart is not very common, its disturbed action may be due to indigestion, liver irregularities &c. A Stomach disturbed with wind, or indigestable food will cause pain and fluttering by crowding on the nerves of the heart. Burdock Blood Bitters will speedily remedy all such difficulties.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

CONSUMPTION
POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, a **Free Trial Box**.

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,
20L24 **360 Fulton Street, Brooklyn, N. Y.**

LUMBERMEN'S STATIONERY.

We will supply anything in the line of BLANKS or STATIONERY for Lumber Shanties and Offices at City Prices.

Shanty Settlements
Shanty Orders
Shanty Receipts
Shanty Time Books
Shanty Log Books
Shanty Reports
Shanty Ledgers
Shanty Cash Books
Shanty Way Bills
Drive Books

Office Letterheads
Office Noteheads
Office Envelopes
Office Cards
Office Notes
Office Drafts
Office Orders
Office Receipts
Office Blank Books
Office Ship Account Books

And everything necessary to a complete office outfit.

All PRINTING done in the Highest Style of the Art, and at Lowest Living Prices.

BOOK-BINDING of every Description got up in a very Neat and Superior manner.

Account Books Ruled and Bound to any desired Pattern.

For Schedule of Prices address, describing the kind and quality of work desired,

TOKER & Co.,

"THE CANADA LUMBERMAN,"

PETERBOROUGH, ONTARIO.

EMERY WHEELS FOR SAW GUMMING.

EX INUTILI UTILITAS — TRADE TANITE MARK

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

INDIANA WALNUT.

Every day the fact becomes more apparent that walnut in Indiana, once the great walnut state of the union, is getting very scarce. Men who are as competent to judge as any, say that the standing walnut in the state does not exceed 3,000,000 feet, and much of this will not come into market right away, as it is held by farmers who are able to keep it, and do so with two objects in view—the trees on their farms beautify them, and they think that as walnut becomes scarcer it will command still higher prices. In sections which once produced the finest walnut lumber, the lumber cut from the logs now runs 90 per cent. to culls, which shows that the trees which can be got at at all have been closely picked, In the earlier days of the state, walnut was an eyesore to the settlers. It caused them a great amount of trouble, because, when in log-heaps it was consumed with so much difficulty. Had some of the finest trees been allowed to remain, their worth to-day would have been more than the farms on which these trees once stood are now worth ; yet it is not to be wondered at that the early farmers did not consider the prospective value of the wood. They thought it plentiful everywhere ; moreover, the groves, in great part, were obliged to give way, in order that a living could be obtained from the soil. Not many years ago the largest trees went begging for buyers at $3 and $4 each, which are now worth $100 to $150 each, and even higher prices than these have been paid. The most valuable use to which the settler could put the wood was in making rails, and for this purpose, as a matter of course, the finest, straightest grained trees were selected. The trees that were not of this kind were put into the log-heaps and burned. There are any quantity of walnut rails, as straight as a gun-barrel, in Indiana, that have served in fences for 40 years and more, and they are as sound to-day as they were the day they were split. In fact a walnut rail will last until the weather beats it into atoms. They rarely rot, and without much doubt many of these rails will, in time, find their way to market, cut into convenient sizes, and the cabinet-maker who uses them will have the satisfaction of working very choice wood, and he will have no cause to grumble because it is not thoroughly seasoned. —*Northwestern Lumberman.*

SHIPPING FOR QUEBEC.

A correspondent, signing himself "Fair Play," writes as follows to the editor of the Newcastle, England, *Daily Journal* :—Sir, in a short time we shall have entered again into the season of activity, when chartering operations will have commenced for the supplies of Quebec timber for the current year, and I would earnestly urge shipowners interested in the trade to consider well the decline, and utterly ruinous state, of what I may call their part of the business, before being led into any future engagements ; and also to endeavor, if possible, to arrive at some understanding, or some unanimity of action, whereby they may be able to promote and protect each other's interests, as well as the value of their own property. The year that has just closed has been one of continued prosperity and profit to all connected with the trade except the shipowner, who, though he must know he constitutes a great power in the business, seems to accept with resignation the position as the inevitable, and, so familiar does he appear to have become with the grinding and unjustifiably low freights of late years, that he may be said to be now acting more from custom than from reason. And yet for all this I cannot but think he has much himself to blame. In most things relating to commerce the market is regulated by the laws of supply and demand, and the value of a commodity is what it will bring ; and it does seem almost inexplicable, and certainly most inconsistent, that while the business is so flourishing and profitable to others, and while, at the same time, wooden ships suitable for the trade are becoming more and more scarce, the rates of freights should each succeeding year continue at almost fixed figures utterly incompatible with any ideas of profit, and altogether insufficient for the purposes of providing the ever-recurring outlay for keeping up the efficiency of the vessels with the requirements of the Board of Trade ; while, at the same time, however contrary it may appear, to the natural course of things, the value of the vessels themselves, instead of being enhanced by reason of the demand being in excess of the supply, has, in reality, declined to less than half what they were worth within a comparatively recent period. If the tonnage engaged in the trade were superabundant, it could easily be understood that not only the rates of freight but the market value of such tonnage, would be reflected in the nature of the circumstances. But take the facts of the present case. Upwards of 700,000 tons of wooden ships under the British flag have been removed from the registry within the last four years, so that, instead of a superabundance of tonnage, it is evident that a scarcity, which is sure to make itself felt, will be the ruling feature in the Quebec trade, until the supplies can be drawn from some other source than wooden ships ; and it might be well for shipowners to remember, and merchants also, that although the opening rates of late years, and notably those of last spring, paralyzed the market for the remainder of the year, they had no sooner been accepted than the actual scarcity of tonnage, which at some time or other was imminent, became apparent, and continued up to the close of the season ; so that in the end the rates which opened in the spring at 22s. and 23s. per load, closed in the fall at 33s. and 34s., and in some cases even higher. The same influence will prevail in the present year, as ships cannot become more plentiful, because they are not in existence, and the trade has all the appearance of continuing as flourishing as last year."

WEST VIRGINIA FORESTS.

Forestry Bulletin No. 25, relating to the forests of West Virginia, has a map of the state showing the distribution of forests with special reference to the lumber industry, and the following comments :—

The forests of West Virginia, with the exception of the belts of pine and spruce confined to the higher ridges of the Allegheny mountains, are principally composed of broad-leaved trees, the most important of which are the white and chestnut oaks, the black walnut, the yellow poplar and the cherry. The forests have been largely removed from the counties bordering the Ohio river, and the most valuable timber along the principal streams, especially the black walnut, cherry, and yellow poplar, has been culled in nearly every part of the state. The black walnut, found scattered everywhere in West Virginia, is least plentiful in the northwestern and Ohio river counties, and most abundant along the upper waters of the rivers flowing into the Ohio through the southwestern part of the state. Yellow poplar is found throughout the state, and is still abundant about the headwaters of nearly all the principal streams, Large bodies of cherry are found in Greenbrier, Nicholas, Webster, and other counties immediately west of the mountains. A large amount of hemlock is scattered through the valleys and ravines of the northeastern part of the state and along the western slope of the Alleghenies. The area still occupied by white pine is estimated to extend over 310 square miles, and to contain about 990,000,000 feet of merchantable lumber. The principal centres of lumber manufacture are along the Kanawha river, at Roncevert, Greenbrier county at Parkersburg, and along the upper Potomac. The lumber product of the state for the census year was 180,112,000 feet of lumber, 12,071,000 laths, 3,695,000 shingles, 41,992,000 staves, and 1,952,000 sets of headings, valued at $2,431,857.

FOREST PRESERVATION.

The New York *Tribune* says :—It is plainly a matter of national importance that certain forest reservations should be set apart in the Government lands on the Rocky Mountains where the Missouri, Columbia, and other great rivers take rise. And California is threatened with desolation so long as the evergreen woods of the Sierra Nevada and the coast range remain unprotected. New York has just begun to appreciate the value of the Adirondack wilderness as essential to the preservation of the Hudson, and New England must throw some safeguards about the forests of Northern Vermont and New Hampshire if the Merrimack and Connecticut are to be saved. This is a forest problem which dwarfs in importance any consideration of the country's future supply of lumber or fuel. The answer we make to this obtrusive question will decide whether vast areas of this continent are to be desert or fertile. By wantonly violating the plain laws of nature man can make a healthful climate deadly, choke up navigable streams, and turn rich farm lands into an uninhabitable waste. Such destruction has been wrought in more than one portion of the Old World, and the time has come for us to heed these melancholy warnings.

SOUTHERN LUMBER.

The *Lumberman's Gazette* says :—Arkansas, Mississippi and Louisiana will soon be called to supply the deficiency in timber now so fast disappearing from the North-west, and when these supplies begin to be drawn from the dawn of prosperity will come. Georgia and Alabama have for years been the champions of the yellow pine trade, and still have immense quantities of it standing, though at the rate it is being cut down the above mentioned states will soon be brought into requisition. In the days of slavery no one thought of developing either of the great industries of the present day, nor did they think of the vast wealth in their possession. Whole neighborhoods drew their lumber supplies from the old-fashioned water-power saw mill, or the primitive whip-saw. Now, however, thousands of saw-mills, furniture factories, planing mills, spoke, handle, hollow-ware and waggon factories, cotton and woollen mills, machine shops, and every other mechanical industry carried on anywhere, find a place among southern industries.

THE CALIFORNIA SUPPLY.

The state mineralogist of California estimates the quantity of lumber cut each year in California and shipped eastward at 70,000,000 feet Cordwood is sent in about an equal quantity. The heaviest drafts on the mountain timber have been for Nevada use. The Comstock lode alone required 1,000,000,000 feet. Notwithstanding this cutting, the replenishing goes on, and no fears are felt for a lack. The Truckee basin and the region around Lake Tahoe have been resorted to most for timber of any regions of the state ; but they represent, it is said, but a small fraction of the timber-bearing surface of the mountains, say 20,000 acres out of a total of several million acres east of the main summit of the Sierra Nevada range. Estimates claim that there is timber enough on the eastern slope of the mountains, between Hope valley and Beckwith pass, to supply Utah and Nevada for half a century, not taking into the account the reproduction that is in progress.—*Lumberman's Gazette.*

PREPARING TIMBER FOR MAKING HUBS, SPOKES AND FELLOES.

After cutting the logs for hubs into convenient lengths to handle, and removing the bark, they should be immersed for a few weeks in water, if convenient to a lake, stream or pond. This will greatly facilitate the process of seasoning without injury to the timber; but this can only be done where convenient circumstances permit. The logs are then taken into the factory and cut into proper lengths by the swing saw, or by a cross cut saw; the swing saw is preferred for its accuracy, rapidity, and economy of power. After cross-cutting a hole is bored through the centre of the blocks endwise. The blocks are now dipped in a solution of lime three parts and Venetian red one part. This solution is reduced to a thin wash with salt water. This retards the seasoning of the surface by absorbing moisture from the atmosphere, so as to prevent "checking."

The blocks should now be piled on end in sheds, or otherwise covered from the sun, and also carefully protected from draughts of air. After three months of summer or five months of fall and winter weather, the blocks should be placed upon their sides, as this position will allow more rapid seasoning. If these directions are followed the blocks will be ready for use in eighteen months from the date of felling the timber. Steam should never be employed in seasoning hubs. Years of experiment convince me that the life and good qualities of the wheel are sacrificed by this mode of seasoning. Excessive heat should never be used in any of the many methods of facilitating the seasoning of timber.

White oak selected, felled and riven or split, is the most preferable for spokes; but care must be taken to fell in August and also to observe the directions for seasoning as for hubs, excepting the length of time, since the planks for spokes are much smaller than those for hubs. Some additional remarks at this point are in place.

In splitting spokes care must be had in examining the tree to see if it preserves its toughness and if the borer, the grub or larva of a wood-beetle, has commenced its work. These evidences of decay are discovered in the splitting and examination of the timber, but in no other way. Such timber must be rejected. In riving or splitting spoke timber many reject the sap-wood, but this is not necessary where the trees have been felled and riven at the proper season as indicated. Let it be noted that wood for spokes must always be split so that the spokes may have the greatest possible strength in the direction of the grain of the wood, for in this direction the greatest strain is received, The spokes should be piled carefully under cover, as directed for hubs; and they can be turned in nine months from the time of felling the trees, and finished in 30 days thereafter.

White-oak being preferred for the felloes, the tree must be of greater diameter than those from which hubs or spokes are made. The property of stiffness, in addition to toughness, is needed in felloes, and to secure this the largest trees are selected, Trees in the vigor and prime of life and free from the work of the "borer" already mentioned, which only invades wood verging on decay, are preferred; especially when the hands divide into two or more very large branches. The time for felling, as before mentioned, from the first to the fifteenth of August in the Middle States, is to be carefully noted. The logs should be immediately taken to the saw mill and cut with a band-saw to insure accuracy, this mode of sawing being also the most economical in material, time and power. The logs must be sawed, or "fitched" as the mill men express it, into slabs of the requisite thickness. The logs should first be sawed through the heart lengthwise, and then each half is laid on its flat face with the round or bark side up, and then cut into slabs by a vertical cut. This is so done to prevent "checking" in seasoning the plank, and also to furnish felloes which do not cross the heart of the wood.

The plank must be piled immediately after sawing. This piling is not the throwing of plank into a promiscuous heap and leaving them thus; for such a proceeding would insure damage from heating and dry rot; but it is the arrangement of the plank in level tiers or platforms in the pile, giving sufficient air space between the planks. This is indispensible in seasoning wood, intended for mechanical purposes. The strips used in separating the layer should be of a different wood, pine, cedar, hemlock, or any variety not inviting to insects of the borer class, and the strips should be of a common thickness in order to prevent warp or set of the plank by uneven bearings and weights. Workmen need the supervision of intelligent oversight in this matter, for their knowledge is not always equal to a task in which science itself is at fault. The air spacing should be greater or less according to the surroundings.

To season timber is not to bleach it; and rain and sunshine are not needed, but should be carefully avoided to insure solid fibre in the wood, as well as save the time and patience of the workman. Where the planks are piled without spacing-strips, the grub of a large black beetle works between the adjoining faces of the plank and eats large grooves in the timber. The spacing-strips should be at least three-fourths of an inch thick by two inches wide, and three sticks or strips are required to support plank 12 feet in length—one strip across the middle and the other strips near the ends of the plank. For longer plank more support is needed.

Felloes cut from the green or unseasoned plank require more hauling, are very liable to warp and become unfit for the intended object. They also lose a considerable per cent of their strength which would be retained in the form of plank and in the manner referred to.—*The Blacksmith and Wheelwright.*

NEW ENGLAND TRADE.

BOSTON, March 22.—Our Boston wholesalers are a busy lot of men. The renewed activity of trade shows itself in many ways. The dealers are inclined to joke when one meets them at their offices, or on the street, and that is a sure sign of good feeling. Out of town trade is every day increasing, and is vieing in importance with the city trade. A certain few of the wholesale men make this branch of trade a specialty, paying little attention to the city business. Boston long since ceased to be a distributing point, the lumber being in most cases forwarded direct from the west to the consumer in the inland towns. Several wholesalers are now located at Worcester, while Springfield has become quite a centre for the lumber trade of western New England. New Haven has several large wholesale houses, and probably the largest retail yards. Other points along the Sound shore are well represented in the lumber industry. The yards are largely supplied by Albany dealers, and are stocked almost entirely during the time that navigation is open, and freight rates by water are so low that competition by rail is out of the question, save in a few instances, on some special grades or dimensions. During the winter months car-load lots are taken on by dealers who find themselves short of certain grades. A peculiarity of trade in this section is the prevailing custom of buying lumber in the rough. Distant readers of the *Lumberman* may wonder why I say "peculiarity." It is such, as compared with Massachusetts trade, particularly around Boston, where dealers buy their lumber very largely dressed to order. Few yards have mills attached, and the price on pine by car-load being the same dressed as in the rough, dealers buy that way.

Spruce is moving very fairly, and orders are plentiful. Parties with whom I have talked, are certain of a good trade, and with present prices must reap a fair profit. If I were to put it any stronger than this probably many mill men might object, for it is a most uncommon thing to hear a spruce manufacturer admit he over made a dollar in the business. He struggles with it out of love for the business.

Yellow pine is moving well. Prices are firm, and some very nice cargoes are being landed. Our local dealers are well prepared for any trade that may come, and suburban trade is well looked after by the wholesale men. Providence, R. I., is fast becoming a point in the yellow pine trade, and at New London, Conn., Bentley & Young are handling immense quantities. James & Abbot, of Boston, make a specialty of boards, and have in stock an immense amount—probably several million feet. C. W. Hall also handles large quantities, and has lately contracted for several mill orders. Wicker & Blade, also George H. Peters & Co. and Stetson & Mosely are each extensive handlers of yellow pine, and supply a large share of the New England trade.

The white pine trade is moving along very satisfactorily. Some very nice lots are now on track at the railroads, largely shipped on order. Prices are firm, and there seems not the least indication to shade prices on lumber that is consigned. Possibly, there may be an occasional exception to this statement. Boston has a few commission men who enjoy the notoriety of being "skinners," a very unwholesome cognomen, but local traders know full well its definition. Wholesale men cannot refrain from buying of these men when car lots are offered them at less figures than they (the wholesalers) could lay it down for in Boston. We are cursed with a few such sellers. They are always in a strait for money, and if they can't swap checks with somebody they sell a car of other folks' lumber at a ridiculously low figure. Somehow these low sales are known by everybody. If a wholesaler obtains a good living figure for his goods, it is kept as much a secret as though an oath had been taken not to reveal it.—*Northwestern Lumberman.*

MAINE PROSPECTS.

The *Northwestern Lumberman* says:—A local paper thus describes the condition of the market at Lewiston, Me. "The severe weather of the past winter has had a depressing effect on the lumber business. The Lewiston dealers report an unusually light winter demand, and some of them have large stocks on hand. 'We had $30,000 worth of stuff, when we stopped running, and we haven't made much of a hole in it,' says one. Spruce is low, and the stock is large in all parts of the country. Carload stuff is selling at from $13 to $13.50, and easy orders are placed at $13@14. The winter has been a good one for lumbering, and it will require only a successful driving season to make spruce lumber very abundant at the mills. The outlook is for low prices. Lumber dealers from St. John say that the outlook for the export lumber trade is not favorable. Lewiston has bought considerable southern pine since last fall. Ordinary building orders for this stock are now placed at $21 long and wide beams at $28@30. The prices on said orders now range from $28 to $30. Floorings are easy at $28@30; floorings, kiln-dried and dressed, and shipped by rail from the South, are now sold here at $38 @40. Cedar shingles are quiet and lower at $4 for extras, and declining about 50 cents each for the lower grades. Hardwood lumber is rather firm for all grades."

LITIGATION ABOUT A LUMBER VESSEL.

OTTAWA, March 21.—The Supreme Court was occupied to-day in hearing the argument in the John Owen appeal case. This is an appeal from the Maritime Court of Ontario, John Emory Owen, defendant in Lower Court, being appellant; D. B. Odette and H. W. Wherry, plaintiffs, respondents. Plaintiffs filed a petition in the Maritime Court to recover damages for destruction of their vessel Minnie Morton by a raft in tow of defendants vessel John Owen, and the Surrogate Judge of the Maritime Court decided that defendant's vessel was solely to blame for the collision, and assessed damages at $2,600. From this judgment the present appeal was taken. Mr. McCarthy appeared for appellant, and Mr. M. A. McHugh, of Windsor, Ont., for respondents. The petition avers that the John Owen was a vessel of 328 tons, and the Minnie Morton a vessel of 30 tons. At the time of the accident the latter was lying at the head of Bois Blanc Island, in Detroit River, and the John Owen was bound down by a raft of logs, when that master negligently steered nearer to the island than he should have done; that the Owen, on account of the size of the raft, was unable to exercise proper control of it; that the raft was carried by the current against the Morton, the latter becoming entangled among logs and carried out into Lake Erie, where she sank. She has not since been found. The accident occurred on the night of the 1st of October, 1881. Mr. McCarthy, for the appellant, contended that the collision was due to negligence on the part of the master and crew of the Morton in allowing their vessel to be anchored in the way of vessels and rafts, which were passing up and down stream at all hours of the day and night; that large rafts passing Bois Blanc Island required nearly all space navigable at that point; and that the Morton at the time of the accident, was lying in the channel without look-out or watch of any kind and without sufficient lights. He further contended that the Morton, lying at such an unusual place in a navigable stream, ought to have been manned so as to have been easily moved out of the way of passing vessels or rafts lawfully using the stream, and that she might have avoided danger had a proper lookout been kept. When an accident occurred without blame to any one, the loss should be borne where it falls, and even if it were shown that the Owen was at fault the damages awarded were excessive. Counsel for the respondent argued that had the Owen pursued a course nearer to the eastern bank of the river, as she should have done, the raft would have avoided the current, and that the raft was too large to be controlled by the tug. He quoted from evidence to show that the Morton was anchored out of the line of navigation, her position being designated by a bright light, visible for two miles. In the position she occupied a lookout was unnecessary, and the accident was due solely to the improper course of the tug. Evidence of experienced vessel-owners, shipbuilders, etc., showed that the Morton at the time of the accident was worth from $3,000 to $3,500, and that she was chartered for $70 per day. Mr. McHugh quoted authorities to show that this Court should not interfere with the finding of the Court below upon questions of fact, and urged that the appeal be dismissed with costs. The argument was not concluded when the Court rose. The Supreme Court will adjourn to-morrow until Tuesday next.—*Globe.*

MICHIGAN LUMBERING.

"Lots of snow around here, yet, I see; but not half as much as where I have just come from."

The speaker was a rugged and muscular man, with face of bronze, clear eye and lively tongue; one who might pass for a sailor home from a foreign voyage.

"And where do you hail from?' was asked by the person addressed.

"Saginaw Valley," he replid, "I've been up there all winter in the lumber camp, on Coldwater Creek. When I left, day afore yesterday, the snow was four foot on the level."

"That makes heavy hauling, eh? Much doing this season?"

"More'n ever; I never seen so much," he replied, "People think the woods are getting cleared out. Pshaw! you can go for miles and miles yet through the prettiest pines you ever see. We had a right smart season all through. The logs ran three and three and a half a thousand, and that gives a chance to make something, you see. When they take seven and seven'n a-half they're mighty small sticks and take a heap of handling; does'nt pay so well."

"Lumbering is pretty hard work, anyway, is it not?"

"Wal, kind of at first, till you get used to it. The men put in about 18 hours a day mostly—up at two o'clock in the morning, and keep at it till they can't see at night."

"How do they see to work in the morning so early?"

"Torches! Man dear, the woods are all lit up, and the gangs go at it hours before day. When you're banking logs, its got to be done. I've seen loads hauled four miles and a-half and a second trip started on afore daybreak. Do the men get good wages? Well, $25 and $30 a month, which is more than the same men can get lying round in town, anyway. Feed 'em well? You better believe they do! The very best of everything. Plenty of fresh beef and pork, and the bakers in the woods make as good bread as you get in town. The camp cooks get $60 a month, and are first-rate. Oh, they give you all the pies and cakes you want. It used to be the other way. Pork and beans was the stiddy dish. Now-a-days the firms must feed the men well, or they will leave for other camps.

It's a trouble to get men, and they will have to be well used. When I was leaving the bosses were hiring men over again for the summer."

"What, are they going to work all the year round in the lumber camps?"

"Yes; you see the season makes little difference, now they are using railroads for hauling logs. My, yes! they're laying down tramways through the bush, and will use locomotives in place of horses. The men don't want to live in the woods in summer time. They can do better at farm or town labor. The Canadians who are over there have just gone for the winter, and most of them will be back home when the snow goes. There's plenty to do in this country now; not as it used to be."

"Are there many Canadians in the Michigan wood?"

Oh, nearly all of 'em."—*London Free Press.*

WINNIPEG PROSPECTS.

The *Commercial* of March 20th, says:—In the prices of building material no great change is anticipated, but what alterations there are will certainly be in the direction of a lower price. Lumber will, it is expected, be lower than it was last year, owing to the increased production, and the improved facilities for bringing the out-put of the mills in our own country to market. The beginning of the Thunder Bay branch and the opening of lake navigation will allow the product of eastern lumber to be brought through our own territory, and save the round-about all-rail route via. Chicago and St. Paul. Prices of American lumber are also tending downwards consequent upon the tremendous production in the Northern States. Lumbermen there are showing signs of alarm lest there be an over-production which may cause a big tumble in prices—so much so that at a recent convention of lumbermen in St. Paul, it was decided in another season to limit the production to a certain extent and thus ward off the possibility of a glut in the market, and a repetition of the stagnation in the trade which occurred a few years ago in the eastern parts of the continent.

BAND SAW MILLS.

The Indianopolis *Woodworker* says:—The growing scarcity of all the fine cabinet woods and consequent increased value, warn the manufacturer that he must convert his timber into boards at the very least possible expense of sawdust. Whilst the saving of lumber in the process of sawing is the principal economic argument in favor of the band saw, it is not the only one. The lumber manufactured by it is of more uniform thickness, and has a smoother surface, and consequently sustains less loss in planing. The width of the lumber is only limited by the size of the log. The annoying "offset" found on all wide boards sawed by the double circular is, of course, entirely absent. The saw being much thinner than the circular or mulay, the power is proportionately less; the kerf being about one-fourth that of the circular, the power required to saw a given amount of lumber should be one-fourth.

A recent visit of a *Wood-Worker* representative to the band saw mill of Hoffman Bros., Fort Wayne, Ind., was well repaid by the very interesting exhibition of fine sawing witnessed. Band mills have already taken the place of circulars to a certain extent in the manufacture of the finer grades of lumber, and the probability is that the day is not far distant when they will come into common use. The mill referred to has wheels six feet diameter, with wooden rims, covered with India rubber. The upper wheel is carried on a steel shaft, hung on an adjustable frame, with attachments for controlling the saw within easy reach of the operator. The vertical adjustment of the upper wheel controls the tension of the saw, and is governed by a weighted lever resting upon a screw fulcrum, compensating for the expansion of the saw and maintaining uniform strain. The guides are of brass and steel, with hardened steel rollers to receive the back-thurst of the saw. The upper guide is hung upon two hollow stems, the whole being counterbalanced so as to be easily raised or lowered to suit the size of the log. The driving pulleys are 30-inch diameter, 12-inch face, the loose one babbited and fitted with suitable oil cups. The feed works are models of simplicity and efficiency, consisting of V-shaped friction cones and wheels, and capable of instantaneous change from slowest to fastest speed. The levers and appliances are so arranged that the head sawyer can, without leaving his position, start and stop the mill, control the tension and back-thrust of the saw, adjust the guides, and change the feed from slow to fast or forward and reverse.

It is necessary that the saws be made of the very best quality of steel, and that the exact temper required be perfectly uniform throughout. They must also be straight, true, and of same guage over their entire length. To meet all these requirements demands great care and skill in the manufacture. The Hoffman Bros. have all their blades made in France, according to their own specifications and directions. The breakage on these French blades is inconsiderable, and in case one does break, it is but the work of half an hour to repair it when suitable apparatus is at hand.

The carriage is the ordinary side-cutting form, similar to those used on circular mills, and is mounted on axles and trucks which run on V-shaped track planed true. The setworks have a patent set, by which the thickness of board may be fixed to the smallest fraction of an inch.

TORONTO NOTES.

The *Mail* says that it is probable that the supply of timber this season will be somewhat small, and will not, at any rate, exceed that of last year. The cost of production to those in the business will be considerably more, owing to the great amount of snow in the woods and the consequent increase in the cost of lumbering operations. In the Muskoka and northern lumbering districts the snow is said to be over five feet on the level, and a large portion of the time of the gangs is consumed in shovelling. Some of the timber merchants think that their stocks will cost $1.50 per M. more than they did last year. On the other hand, there have been so far no inquiries for timber for the States. A number of new stocks have been sold, and at prices quite up to those of last year, but they have been purchased by dealers here. As but few sales have been made for the States as yet, it would be premature to say whether last year's prices will be sustained or not. It is not hoped in any case that there will be an excess in quantity as compared with the stocks of last year, but on the other hand the indications are that the demand will not be so great. Though the cost of production may be increased as compared with last season, dealers think that it does not follow that the prices will be increased or even sustained, as the demand will regulate that. The dealers are not unanimous in their opinions on these points, but will be able to speak with greater confidence in the spring. It is satisfactory to know, however, that there appears to be no great danger of a serious advance in prices.

ARTIFICAL SEASONING OF LUMBER.

The advantages of seasoning lumber by artificial means are too well known and appreciated at the present time to require extended argument in favor of the system. It is a subject of more than ordinary interest to lumbermen just now, for the reason that the natural changes in the methods of doing business actually necessitate some quicker process of drying lumber than open air seasoning. Saw mill men, especially, whether sawing the white pine of the northwest or the yellow pine of the south, are beginning to more than ever realize the importance of the planing machine and the dry-kiln as factors in the successful prosecution of their business. Long shipments by rail can not be made profitable unless the product to be transported is first shorn of every pound of superfluous weight. Shavings, edgings and trimmings are more profitable as fuel than when added their extra weight to a consignment of lumber destined for a distant dealer, who will not pay as much for the rough as for the dressed material.

The same is equally true regarding the surplus moisture contained in green or half dried lumber. The shrewdest lumbermen in this country can not make it profitable to pay all the way from 18 to 40 cents per hundred pounds on water, and every thousand feet of green white pine lumber, fresh from the saw, contains 2,000 pounds of moisture that a few days treatment in a dry-kiln will expel from it. In yellow pine and the various hardwoods the necessity for drying becomes greater in proportion to the difference in weight.—*Woodworker.*

WELL AS EVER.—Lottie Howard writes from Buffalo, N.Y.:—"My system became greatly debiliated through arduous professional duties; suffered from nausea, sick headache and biliousness. Tried Burdock Blood Bitters with the most beneficial effect. Am well as ever."

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1YL7

Would you avoid the Biliary complaints incidental to spring and summer? Cleanse the system with Burdock Blood Bitters. It regulates the Liver, Bowels, Kidneys and Blood, and is the purest tonic in the world. Trial bottles 10 cents.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily, and honorably. Address TRUE & Co., Augusta, Maine.

ONTARIO TREE-PLANTING ACT.

The following is a copy of the Tree-Planting Act passed at the last session of the Ontario Legislature, and will no doubt prove interesting to many of our readers :

Her Majesty, by and with the advice and consent of the Legislative Assembly of the Province of Ontario, enacts as follows :

1. This Act may be cited as "the Ontario Tree-Planting Act, 1883."

2. Chapter 187 of the revised statutes of Ontario is hereby repealed.

3. Section four of this Act shall not apply to any incorporated city, town, or village, unless the Council thereof first passes a by-law making the same apply thereto.

PLANTING TREES.

4. Any person owning land adjacent to any highway or to any public street, lane, alley, place, or square in this province, may plant trees on the portion thereof contiguous to his land ; but no tree shall be so planted that the same is or may become a nuisance in the highway or other public thoroughfare, or obstruct the fair and reasonable use of the same.

(2) Any owner of a farm or lot of land may, with the consent of the owner or owners of adjoining lands, plant trees on the boundary lines of his farm or lot.

(3) Every such tree so planted on any such highway, street, lano, alley, place, or square, shall be deemed to be the property of the owner of the lands adjacent to such highway, street, lane, alley, place, or square, and nearest to such tree ; and every such tree so planted on a boundary line aforesaid shall be deemed to be the common property of the owners of the adjoining farms or lots.

(4) Every tree now growing on either side of any highway in this province shall upon, from, and after the passing of this Act be deemed to be the property of the owner of the land adjacent to such highway, and nearest to such tree, shrub, or sapling.

MUNICIPAL BONUS.

5. The Council of any municipality may pass a by-law for paying out of municipal funds a bonus or premium not exceeding twonty-five cents for each and every ash, basswood, beech, birch, butternut, cedar, cherry, chestnut, elm, hickory, maple, oak, pine, sassafras, spruce, walnut, or whitewood tree, which shall, under the provisions of this Act, be planted within such municipality on any highway or on any boundary line of farms as aforesaid, or within six feet of such boundary.

(2) Such by-law shall furthor provide for the appointment of an inspector of trees so planted ; for their due protection against injury and against removal by any person or persons, including the owner, excepting as authority may be given therefor by special resolution of the Council ; for the conditions on which bonusos may be paid ; and generally for such regulations as are authorized by chapter one hundred and seventy-four of the Revised Statutes of Ontario, section 454 (16).

(3) Printed copies of the said by-law, together with sections four, five, six, and seven of this Act, shall be posted throughout the municipality, and all claims made to the Council under the provisions of the by-law shall be referred to the inspector to obtain proof of the same and report thereon.

DUTY OF THE INSPECTOR.

6. The Inspector shall make to the Council one report for each year, if required so to do giviug the names of all persons entitled to any bonus or premiums under the by-law, the number of trees of each species planted, and the amount of bonus or premium to which each person is entitled, and certifying that the distance between any one tree and the tree nearest thereto is not less than thirty feet, that the trees have been planted for a period of three years, and that they are alivo, healty, and of good form ; and upon the adoption of such report the bonuses or premiums shall be paid.

PROVINCIAL TREE-PLANTING FUND.

7. The Treasurer of the Province, upon receiving a copy of the inspector's report, certified by the Reove and Clerk, shall recoup to the Treasurer of the municipality one-half of the the sum paid by the municipality under the authority of this Act, the said copy to be forwarded on or before the first day of November in each year.

8. The sum of fifty thousand dollars is hereby apportioned and set apart for the object of the foregoing section, and shall be known as "The Ontario Tree Planting Fund."

PENALTIES.

9. Any person who ties or fastens any animal to or injures or destroys a trce planted and growing upon any road or highway, or upon any public street, lane, alley, place, or square in this Province (or upon any boundary line of farms, if any such bonus or premium aforesaid has been paid therefor), or suffers or permits any any animal in his charge to injure or destroy, or who cuts down or removes any such tree without having first obtained permission so to do by special resolution of the Council of the municipality, shall, upon conviction thereof before a justice of the peace, forfeit and pay such sum of money, not exceeding twenty-five dollars besides costs, as such justice may award, and in default of payment the same may be imprisoned in the common gaol of the county within which the municipality is situate for a period not exceeding thirty days.

(2) One-half of such fine shall go to the person laying the information, and the other half to the municipality within which such tree was growing.

TREE BY-LAWS.

10. The Council of every municipality may pass by-laws :

(1) To regulate the planting of trees upon the public highway.

(2) To prohibit the planting upon the public highways of any species of trees which they may deem unsuited for that purpose.

(3) To provide for the removel of trees which may be planted on the public highway contrary to the provisions of any such by-law.

SPRUCE LOGS.

Mr. Ives, In the House of Commons on Wednesday, March 14th, introduced a resolution declaring it expedient to consider the question of an increase of the export duty on spruce logs exported from the Provinces of Ontario and Quebec. There was nothing new in the principle in his motion. He said there was already a duty, and the only question was as to whether it should be increased. As it was, thore was an export duty of $1 per thousand. The Americans, on the other hand, enforced a duty of $2 a thousand upon all sawn lumber. Thus there was a bounty of $1 per thousand in favor of carrying our logs across the line and manufacturing them in the United States.

Mr. Benson thought the principle should be extended to all kinds of saw-logs. Unless this was done, our own shingle and other manufacturers in wood would have to give up the business altogether.

Sir Loonard Tilley said the Government had the matter under its consideration. One of the difficulties it had to deal with was the question as to how the change would affect persons who had already mado contracts and were cutting logs for the prosent season.

Mr. Charlton said tho increase of export duty for the advantage of a few saw-mill men would bo most unjust, and would operate in favor of a fow mill owners to the disadvantage of a great number of farmers and dealers in logs. The export duty already was a measure of protection for Michigan lumbermen. If it was not for that duty, the lumbermen on the Georgian bay would be in a position to export their lumber in great quantities to the markets of Toledo and of the United States generally. Besides, the increase of export duty might invite reprisals on the part of the United States, and would prejudice our chances of getting American import duties on Canadian lumber removed. Should America decline to remove that duty, it would, in view of an increased export duty, be but poetic justice.

Mr. Ives said the House was accustomed to hear an annual speech on the follies of protection from the hon. member for Norfolk, and he supposed his motion had afforded the opportunity on the present occasion. In many cases the Government had applied protection where they believed it would have the effect of increasing the price, in the belief that the matter would soon regulate itself, and the result had been as they anticipated. This had had the affect of furnishing more work, creating a larger market, and giving increased consumption. The effect of the proposed increase in the export duty on logs would not decrease their value to the seller but the very contrary. As the law now stood the American mauufacturer was able to pay one dollar per thousand more than if this extra duty were put on, and if it were imposed the effect would be that the American manufacturers would bring their machinery and capital to this country to manufacture the lumber, instead of it being taken out of the country.

Mr. Mitchell said he was a National Policy man, but he was not prepared to adopt the arrangements under which the markets to which men who had invested their money in lumber looked would be closed against them. He did not approve of hampering the lumbermen, and he only hoped that the Government would remove the duties on cornmeal and pork, which were injurious to the lumber trade in the Maritime Provinces. This, he thought, could be done without impairing the revenue or violating the National Policy, which had done such a great deal for the country.

Mr. Cook said that this proposal, if accepted, would strike at the fundamental principle of the lumber trade, which was to find a ready market for its produce. But it was not only the lumbermen who would suffer. The farmer who owned lumber on his farm would be injured. He did not rise so much to refer to that point, which had been ably dealt with by the member for North Norfolk, as to protest against the use of the term speculators, as descriptive of lumbermen. If the lumbermen were mere speculators, what were the men to whom the lumber of the North-West was being given, not by public competition, but by private arrangement? So far as he was concerned, the duty would not affect him to any extent, for he exported his lumber in the manufactured state, and sent his sawn logs to England. He, however, hoped the Government, instead of increasing the duty on logs, would remove it altogether.

Mr. Sproule said however accurate the views of the member for Northumberland (Mr. Mitchell) might be as applied to the Maritime Provinces, they were not applicable to his part of the country. The remarks of the hon. member for Simcoe (Mr. Cook) regarding speculators in timber limits in the North-West came with very bad grace from him—(hear, hear)—for he was connected with one of the most extensive firms in the lumber trade ; not only that, but he was a great monopolist, and it had been found impossible, out of numerous mills in the district, to find many that were not controlled by tho Cook Bros. (Hear, hear.) Beyond this, he might remark that it was a mistake to suppose that farmers in the Georgian Bay district had large quantities of timber, and that the export duty would affect them. The Ontario Government took good care that they should not own valuable timber. (Hear, hear.) In fact, they gave the timber into the control of their favored monopolists by a peculiar manœuvro. A few years ago the Government of Mr. Mowat offered the limits for sale by public competition. It was understood that the supportors of the Government would buy in these limits at a figure that fair competitors could not afford to pay for them. After a time these men said they could not make their operations pay, and their limits fell into the hands of the Government, and were passed over at a reduced price to the persons on whose hands they now were.

Mr. Bolduc thought it would be in the interest of the trade if a duty of $2 per thousand were placed on all classes of logs exported.

Mr. Scriver said that in his constituency spruce timber was owned by farmers, and of necessity they were obliged to draw their logs across the line to find a market. He believed the increase of duty was in the interest of a few mill-owners and at the expense of the large class of agriculturists.

At the suggestion of the Minister of Finance the motion was withdrawn.—*Mail.*

AUSTRALIAN TRADE.

Messrs. Gemmell, Tuckett, & Co.'s report, dated Melbourne, January 17th, says :—Since last issue holidays have considerably interfered with business, the demand for all descriptions of timber being on a smaller scale than formerly. The large arrivals from Sweden and Norway have had a depressing effect on the market, and dealers are afraid to operate at present, prefering to wait the turn of events and reduce their stocks in the meantime. American lumber.—This line continues in good demand, and all parcels offered have realized prices fully sustaining late rates. We report sales of Michigan clear, 1¼ to 6 in., £17 2s. 6d. to £18 7s. 6d. : w. p. shelving (good), £11 2s. 6d. ; inferior, £9 17s. 6p. ; w. p. t. and g. ceiling, £9 5s. to £9 2s. 6d. ; 7-8 in. dressed clear shelving, £16 5s. to £16 7s. 6d. ; 1¼, 1½, and 2in. Canada clear, £14 10s. to £15 per m. super, the trade holding stocks only sufficient for present requirements. Norwegian and Scotch flooring.—The imports aggregate 8,604,804 ft. lineal. This quantity, combined with stocks in store, is beyond our requirements for some time, notwithstanding that the consumption continues on a large scale. Late sales show a falling off from last month's rates.

Messrs. C. S. Ross & Co. report :—Since departure of Rossetta, on 20th of December, the sales of timber have not been large, but it is evident that the numerous arrivals and the high rates for money have induced caution, and the deliveries for consumption are considerably less than at last advice. The imports for the month have been very heavy, and in some lines the arrivals during the past six months have been equal to the imports of the previous twelve months, and a large portion of this season's landing will be in stock to meet the arrivals in January, 1884. The very low freights from the west coast of America, and moderate freights from Norway, have induced excessive shipments of Oregon timber and flooring boards, and the quantity of red deals, from Sweden, is also beyond the rate of consumption. The great difficulty at present experienced is in the landing of cargoes, many vessels waiting from a week to a fortnight for a berth. It is almost unnecessary to state that nearly every liue is sold at considerably less than the cost of importation. In addition to cargoes intended for this port, several cargoes on Adelaide and Sydney account have been ordered here, adding to our heavy stock, and tending to lower prices. It is impossible to forecast the end of the present large stock, but we anticipate that if money remains at present rate we do not require any red deals or flooring from Norway or Sweden for the next twelve months, as there will be a serious decline in the consumption.

New York.

The New York *Bulletin* of March 13, says : Thus far this week the general movement has been moderate, and without the development of new features over the condition of the market. In a general way consumption is now on the increase, and a steady growth may be expected as the season becomes more open, but necessity governs the action of all buyers and little or no investment against the future takes place. Dealers in consequence are not inclined to add to their yard stocks with freedom, and are particular in the selection of quality, the result of which is a failure to give any anxious attention to random offering from first hands unless something unusually attractive is shown. Agents, however, are getting a fair number of specifications for both building and manufacturing cuts, and can in most cases secure full bids.

Messrs. Brouse & Wood, who have a saw-mill and timber limit at the mouth of Bad Throad River on Lake Winnipeg, are getting out tamarac piles from 20 to 25 feet long, some of which are for the docks at Selkirk, and the balance will be left here for sale. There are also getting out 20,000 ties for the Winnipeg Street Railway and 1,500 cords of wood for the North-West Navigation Company, together with 4,000,000 shingles, 500,000 laths and about 5,000,000 feet of lumber, which will be disposed of at Selkirk.

Erysipelas, Scrofula, Salt Rheum, Eruptions, and all diseases of the Skin and Blood are promptly cured by Burdock Blood Bitters. It purges all foul humors from the system, imparting strength and vigor at the same time.

Chips.

THE Montreal *Gazette* says:—The market remains steady and values are maintained all round, with talk of an advance on some kinds of hardwood.

L. C. GULICK, agent for the Western Union Telegraph Company, is buying poles at Duluth, 4,000 having already been shipped and 20,000 being the intended number to be secured,

UNDER the heading of Regina the Winnipeg *Commercial* of March 13, says:—As an evidence of the activity in building we might mention that one of the seven merchants sold $13,000 worth of lumber during the forenoon of Monday last.

PERSIA, Russia, Spain, Greece, Palestine, Switzerland and other countries are suffering in consequence of the destruction of their forests. We should profit by their sad experience, and take care of our forests before it is everlastingly too late.

AN Ottawa correspondent says:—Messrs. Barnet & Mackie, of Pembroke, have purchased from Ross & Co., Quebec, three limits on the Sturgeon River, Nipissing, the whole comprising one hundred and ten square miles. The price paid was over $10,000.

THE *Lumberman's Gazette* says:—Chicago City is pig-headed enough to tax lumberman $100, and the men interested propose to see if the action is legal. They say they are anxious to know "if the city is to be run entirely in the interest of the whiskey ring."

THE Trenton correspondent of the Belleville *Intelligencer* says:—Messrs. Gilmour & Co. have about 200 men employed in making the necessary alternations in their large mill, in order to be ready to commence cutting lumber on the opening of navigation.

IN the Bill for the consolidation of the Dominion Lands Acts there occurs the following clause relating to timber lands:—"The renewal of a lease shall not be given in any case where the lessee has failed to pay any ground rent, royalty or other duties in connection therewith."

The Winnipeg *Commercial* of March 13, says: As the building season approaches there is freer inquiry: Prices are: Sheeting, $28; common dimensions, $30 to $32; fencing, $28 to $34; stock, $33 to $40; flooring, $35 to $45; graded clear, $50 to $70; shingles, $4.50 to $6; laths, $5.

THE *Northwestern Lumberman* says:—Much of the charcoal used by the Menominee, Mich., Furnace Company is made of pine slabs, which are conveyed from the mills to the coal pits on a tramway. It is refreshing to know that some of the waste at Menominee does not go to the refuse-burner.

MESSRS. Boyd, Caldwell & Co. have in course of erection at Caldwell Lake, near Wilbur Station, on the line of the Kingston and Pembroke Railway, a new saw mill which is intended to run by steam power, and is calculated for a cutting capacity of between 30,000 and 40,000 feet per diem.

The Rat Portage correspondent of the Winnipeg *Commercial* says:—Mr. Bayne, D. L. S., arrived here lately from Lac Seul, where he has surveyed a large timber limit for eastern lumbermen. There will be 400 men employed in connection with the two large saw-mills now approaching completion at this point.

A LANDOWNER on Cape Cod, Massachusetts, says that he owns about a hundred acres of land, of which some was so poor that it yielded nothing put poverty weed. In 1851 he commenced planting pine seed, continuing for ten years, and now he has about eighteen acres of quite valuable woodland, which was worthless before.

THE Swedish correspondent of the *Timber Trades Journal* says:—The export of sawn and planed wood from the Gefle Custom House district amounted to the comparatively moderate total of 87,690 Petersburg standards in 1882, showing scarcely an average quantity. Of this, about half was sent to Great Britain, after which in consecutive order come France, Belgium, and Australia. To the latter country twenty-two cargoes were sent, with an aggregate cargo quantity of about 7,500 standards.

REPORTS from the au Claire district, Wisconsin, are to the effect that "breaking camp" has already set in, and that about 80 per cent. of the anticipated log crop is probably a fair estimate. The snow is disappearing gradully and the indications are favorable for an ordinary freshet and a successful running of logs to the booms.

WHEN the interior of the island of Mauritius, upon which the forests were cut down that the cleared land might be used in sugar cultivation, was densely wooded, a large portion of the rain water was retained, and filtration was so gradual that even in the dryest places the lagoons received regular supplies of pure water. Now the greater part of the rain water is carried away to the sea, and in dry weather the sun's rays beat down on slimy, fetid marshes.

THE lumber manufactured on Lake Winnipeg this year is expected to amount to about 35,000,000 feet contributed as follows: Brouse & Wood, 2,000,000; Dick & Banning, 5,000,000; Brown & Rutherford, 3,000,000; Drake & Rutherford, 4,000,000; Walkley & Burrows, 6,000,000; H. G. Stubbs & Co.. 3,000,000: Jonasson & Frederickson, 2,000,000; Shore & Co., 2,000,000; Schnider & Co., 3,000,000; with two mills to hear from.

A FEW of the Michigan lumbermen who have cleared their land of pine are now converting the hardwood that is left into charcoal. They think it pays better to even make the maple into charcoal than to saw it into lumber, for in coal-making all the limbs, as well as the trees that would be poor sawing material, can be utilized. A cord of dry wood will make from 40 to 50 bushels of charcoal, which sells, on an average, for about eight cents a bushel.

The *Lumberman's Gazette* says:—The establishmement of the stave and heading factory at Otter Lake is proving a great benefit to the neighboring farmers, if one may judge from the large quantities of bolts laid down in the yard daily. And some are teamed a distance of twenty miles! Besides those delivered at the factory, hundreds of cords are being piled up along the line of the Michigan Central and Flint and Pere Marquette railways as far south as Oxford and east as Geneseeville.

THE *Timber Trades Journal* says:—The promised limitation in the log cutting at Sweden is a step in the right direction if properly carried out, and other places ought to follow this example. At present we only know that such an arrangement has been made; whether it will stand, should trade brighten is quite problematic. The great drawback to trade is the heavy consignment cargoes thrown on the market one after another without reserve, and it is these which do much to keep values at a low level.

THE weather in Sweden has been very unfavorable for forest work for sometime past, and the *Timber Trades Journal* learns that it is very difficult to drag the logs out of the woods, the thaw having partially melted the snow. Without the ground is first frozen, we are informed, the snow in those latitudes has but an insecure foundation, owing to its mass, and as the fall preceded the frost when winter set in, and was unusually heavy, the work in the part of Sweden referred to is greatly impeded.

THE *Northwestern Lumberman* says:—Remarkable stories are encountered in the traditions of the woods. The latest and perhaps the toughest, is to the effect that in the heart of an oak tree, a Bucksport, Me., chopper found a diamond pin with 24 brilliants. The tree is supposed to be 120 years old. About everything has now been found, at one or another time and place, imbedded in trees, except patent medicine advertisements, and this omission is the most singular feature of the phenomena.

THE *Lumberman's Gazette* says:—It is astonishing what an amount of logs other than pine are being harvested this winter. Ash, basswood, elm, hemlock, maple, sycamore and every species of timber is being piled up at every station on the F. & P. M. railroad from Bay City to Rced City, and the same is the case on the line of the Michigan Central all the way from Mullet lake to Owosso. In cedar also, and especially in hop polcs, thero is most wonderful activity, and the aggregate of all the hardwood, so-called, is certain to augment materially the volume of business in all this section.

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:

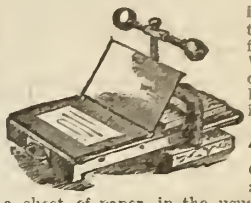
ZUCCATO'S PAPYROGRAPH



Is a new invention for the rapid production o fac-simile copies of any Writing, Drawing, or other work which can be done with pen and ink.

Autograph Letters

Circulars, Music, etc. are first written upon a sheet of paper, in the usual way, and from this written sheet

500 COPIES PER HOUR

may be printed upon any kind of dry paper, or other material, in a common Copying Press.

This is the Most Simple, Rapid and Economical Process yet Discovered.

THOUSANDS are already in successful use in Government Offices, Colleges, Academies, Public and Private Schools, Railway and Insurance Offices. Also by Business Men, Lawyers, Clergymen, Sunday-school Superintendents, Missionaries and others.

The Simmons Hardware Co., of St. Louis, says of it: "Our Papyrograph, purchased sometime since, gives entire satisfaction. Would not be without it for $1,000 a year.

For specimens of work, price-list, etc., address with stamp.

THE PAPYROGRAPH CO.,
43 and 45 Shetucket Street, Norwich, Conn.
☞LOCAL AGENTS WANTED.☜

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

CONSUMPTION
POSITIVELY CURED.

All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humhug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**

We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.

Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

EARS FOR THE MILLION

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.

This Oil is abstracted from peculiar species of small **White Shark,** caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous,** that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!

It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

☞To avoid loss in the Mails, please send money by REGISTERED LETTER.

Only imported by **HAYLOCK & JENNEY,**

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. APRIL 2, 1883.

WINONA lumber dealers have orders from Dakota for 400 carloads of lumber, which will be shipped when the cars can be had.

FOUR rafts of walnut logs, valued at nearly $100,000, arrived lately at Chattanooga, Tenn., by river, from the Virginia mountains.

A LARGE quantity of tamarac poles are being gotten out at Alpena, Michigan. These are to be used by Lake Erie fishermen for trap nets.

HARDWOOD timber is being brought to the Dixville mill by Messrs. J. J. Parker & Co., in quantities larger than has ever before been taken there in any one winter.

THE Parry Sound *North Star* says:—Some of the lumber camps are now breaking up, and preparations are being made for starting the drives at the earliest possible moment.

As the debate in the House of Commons on the export duty on spruce logs must be of interest to our readers, and was considerably mixed up with political questions, we have given the reports both of the *Globe* and *Mail*.

THE *Timber Trades Journal* says:—We are informed that two of the leading Gefle houses have already succeeded in placing something like 12,000 standards of their production on the basis of £11 10s. This appears to be corroborative of our remarks a week ago, that shippers in Sweden were still disinclined to make any serious concession on their first quotations.

IN speaking of large trees, *Wood and Iron* says that the big trees of California are overtopped by the peppermint trees (*Eucalyptus piperita*) of Australia. Baron F. Von Mueller, of Melbourne, describes one of the gigantic height of four hundred and eighty feet. Prof. T. K. Bruner says: "It is well known that North Carolina comes next to the great west in the production of trees. Major Bomar of that state, has just felled a chesnut which measured nine feet in diameter. A gentleman and lady may walk through the trunk without getting near as close as they do at a lawn party. This tree was a sapling when Columbus was sailing westward in search of the undiscovered world."

THE *Lumberman's Gazette* says:—No Muskegon lumberman has put in the full amount of logs he figured on at the beginning of the season. They are all short of their calculations, and the total shortage on the intended crop will reach fully 150,000,000 feet, says the Grand Rapids *Democrat*; but winter "still lingers," and this shortage scheme is being shortened up with most wonderful celerity.

THE Orillia *Packet* says:—Mr. R. R. Weir closed the last of his shanties last Friday, though several jobbers are still at work completing their contracts. He has about four million feet of logs out for his mill on the Black River, at Fawkham, and half a million to be cut at Mr. Tasker's mill, Uhthoff. Mr. Weir expects that water will be abundant for river-driving this spring. His mill at Fawkham will be in oporation by the first of next month.

A WRITER on the future of the lumber industry argues that the south is destined, sooner or later, to supply the timber demand of South America and the West Indies. The forests of Alabama, Mississippi and of Eastern Texas are nearer the plantations of the West Indies, and the yellow pine of the south is much sought after in the tropics for the reason that it best withstands the destructive attacks of the numerous insects that swarm in the air or creep on the soil of the Antilles.

The Winnipeg *Free Press* says:—Ranches now abound all along the base of the Rockies between Calgary and Fort McLeod, and it bids fair to become a prolific trade. Wood is scarce but some fuel is obtained along the streams. In the foot-hills of the Rockies there is plenty of good spruce, tamarac and pine timber. Mr. Cochrane has a portable saw-mill at Calgary, which cut a good deal of lumber last season from logs that were floated down Elbow River. Lumber now commands $50 per thousand at Calgary.

THE Winnipeg *Times* says:—West Selkirk is destined at no early day to become a busy place. It is advantageously situated, and the people are energetic and full of business. The Northwest Navigation Company purpose building a large dock there and to employ six huge barges in bringing lumber from the lake. Mr. Brouse, of Winnipeg, is now getting out the piles for this structure at Bad Throat River. A saw-mill is also to be erected this year at West Selkirk of a capacity of 50,000 feet per day. The machinery is already on the ground.

PROFESSOR BOGDEN HOFF, of Jaroslaw, Galicia, has invented an incombustible wood, which will not burn at the temperature of molten glass. A greater degree of heat leaves the wood a compact coal, which does not burn. At the degree of heat at which this transformation occurs zinc melts in seven seconds, slate breaks in fragments and tiles become glazed. The process of manufacture is simple and cheap, and the wood is as easily worked as before treatment with the required chemicals, which are compounded from the refuse of the industrial establishments.

THERE is a remarkable fir tree in the forest of Alliaz, Canton of Vaud. It is near the baths of Alliaz, at a height of about 1,300 feet above the hotel, and 4,500 feet above the sea, surrounded by a forest of firs, which it overtops by more than thirty feet. The trunk is a little more than thirty feet in circumference at the base. At about a yard from the ground it puts out, on the south side, seven offshoots, which have grown into trunks as strong and vigorous as those of the other trees in the forest. Bent and gnarled at the bottom, these side trunks soon straighten and rise perpendicularly and parallel to the main stem. This feature is not, perhaps, wholly unparalled, but another most curious fact is that the two largest of the side trunks are connected with the principal stem by subquadrangular braces resembling girders. The space between the rough flooring formed by the growing together of the offshoots, at their point of departure, and the girder limbs, is large enough to admit of building a comfortable hermit's hut within it.

IT is estimated that 125,000,000 feet of logs will be put into the Kennebec and tributaries, Maine, this season. Operations have been mainly confined to the Dead river, Moose river and Moosehead lake sections, with a large amount cut on the main river. Ira D. Sturgis and Charles Milliken have taken the contract to drive all the logs along the river from Moosehead lake to Augusta. The work will begin when the river opens, and some 250 men will be employed.

LYNDEN, ONT.

We have received the following letter:—

"SIR,—Inclosed please find $2, our subscription for the CANADA LUMBERMAN from the 1st of January, 1883, to the first of January, 1884. Kindly acknowledge. The lumber business around here is brisk. Great use was made of the splending sleighing, which we have had for about three months for getting in logs. We have in about 1,500,000 feet. Prices are firm.

Yours respectfully,

ROBERT THOMPSON.

Lynden, Ont., March 19, 1883.

QUEBEC FORESTS.

In the Legislative Assembly of Quebec on March 26th, the Hon. Mr. Blanchet, in absence of the Hon. Mr. Lynch, moved the House in Committee to consider the following resolution respecting the sale and management of timber on Crown Lands.

Resolved—1. That it shall be lawful for the Lieut.-Governor-in-Council, immediately after the coming into force of the Act to be based upon this resolution, to set apart as forest land all the ungranted lands of the Crown now held under licenses to cut timber, except such parts of such licensed lands on which no merchantable timber grows, and which are fit for settlement, and also such other portion of ungranted lands of the Crown as the Lieutenant-Governor-in Council, on the recommendation of the Commissioner of Crown Lands, may think fit so to set apart, and that, as soon as the order or orders-in Council setting apart such forest land shall be published in the *Official Gazette*, and from and after the date of such publication, no land included in the territory so set apart shall be sold for settlement purpose until after the expiration of at least ten years, and not then until after it is established to the satisfaction of the Lieutenant-Governor-in-Council that the whole or any portion of such territory is no longer fit for the production and culture of timber, and may with advantage be opened for settlement.

After some remarks in support from Hon. Mr. Blanchet,

Mr. FLYNN said he highly approved of any measure for the protection of our forest wealth, but contended that the resolution went further than the Government probably intended, and that, if carried in its present shape, it would retard the settlement of our Crown lands for at least a dozen years, as, generally, the timber limits throughout the province included the best agricultural lands. As he understood it, the adoption of the resolution would exclude settlers from these lands for a period of ten years, and he thought this a step backward instead of a step forward.

Mr. IRVINE denied that this was the meauing of the resolution.

Mr. JOLY said that what the Government appeared desirous of protecting, in his opinion, was our pineries, and it was a universally acknowledged truth that they did not include auy good agricultural lands.

Mr. FLYNN said the Forestry Congress never asked the Government to set apart all the timber limits as forest reserves. What he believed was their wish, what he believed the Government probably intended, and what he had no objection to see adopted, was the principle that all lands unfit for agricultural purposes, whether included in the limits or not, should be set apart as forest reserves.

Mr. SAWYER thoroughly agreed with the last speaker, arguing that to adopt the resolution in its present shape was to cry "staud" to the settlement of the provinces for the next decade.

Mr. DUHAMEL believed that the adoption of the resolution would give the Government more trouble than they imagined. He referred, for instance, to the fact that license-holders might declare, and with reason, the hard woods merchantable timber, and in that case, the Government would find their hands tied, and would be obliged to shut out settlers from lands on which those woods grow, and which were known to be the very best for agricultural purposes in the country.

Mr. NATEL hoped to see the resolution amended, as it would never do to pass it in its present shape.

Mr. TRUDEL thought the subject matter of the resolution too important to be properly considered at this late stage of the session, and advised the Government to hold it over until the next session.

Hon. Mr. BLANCHET said the Government were willing to strike out the words in the resolution "on which no merchantable timber grows," which, he thought, would obviate all objections.

Mr. FLYNN said there was no necessity for the resolution, as there were already two laws on the statute book which permitted the Government to quite as fully attain the object they had in view, without running the danger of passing a measure prejudicial to colonization.

After some further discussion, the resolution was allowed to stand until Mr. Lynch's return from Knowlton.

SPRUCE DEALS.

The London *Timber Trades Journal* says:—It is somewhat remarkable that so little importance should be attached by dealers to the relative values of different shipments of spruce deals. A very few shillings a standard difference in the price, it would appear, is considered of infinite more importance than almost any difference of kind. The above remarks do not, of course, apply to 4th quality spruce deals, which would, and in point of fact often do, sell at very low figures. It has many times occurred to us to consider whether the importation of 4th quality spruce deals is worth continuing.

The waste in this quality of wood, whenever required to be cut up, is enormous, and must swell the price of the real cost of the material to more than the margin which lies between it and merchantable wood.

It is not fitting that the 4th quality deals should be employed for weight-bearing purposes, and so used whole. They are almost always affected with taint, or else badly cross-shaken. In either it is hazardous to employ them for such purposes. As they can hardly be economical, and as their use is assuredly not desirable, it may well be considered whether their further importation is a necessity.

Spare the Hemlock.

The *Courier and Journal*, of Potsdam, N.Y., calls attention to the fact that the bark-peelers are making havoc with the hemlock of that part of the state, the value of which, for timber and lumber purposes, is becoming more apparent since the spruce is being so heavily drawn upon for supplies. The paper referred to says:—

Few people realize how rapidly the hemlock is disappearing from our forests. It is destroyed, not for timber or for fuel, but almost solely for the sake of the bark. Lumbermen have proposed to attack the hemlock when the spruce shall have been used up, but against the unscrupulous rapacity of the bark-peelers and tanneries, hemlock has no show for existence. All through the Adirondacks these trees are fast falling, and their stripped trunks show that the insatiable appetite of the bark-mill has been felt even there.

Preserved Piles.

The Pacific Pile-preserving and Construction Company has been organized in San Francisco, Cal., with the following directors: William N. Horton, George Gray, Joshua Hendy, J. R. Scupham and B. S. Taylor. The Company is formed for the purpose of manufacturing and selling a preparation for preserving wood to be used in the construction of wharves, bridges, etc. The capital stock is $500,000, and is mainly subscribed. A $5,000 auger will be one of the details of the outfit of machinery. It is intended to start the business on Puget Sound as soon as everything is in working order. The

process employed is patented and declared feasible. It is asserted that the pile men of San Francisco are much perturbed by the scheme, which offers advantages to builders over their own facilities.—*Northwestern Lumberman.*

COSTLY FIREWOOD.

Several years ago a vessel was wrecked on Cape Cod, and among other portions of her cargo that floated ashore were a number of heavy hardwood logs, which, after knocking about in the surf for some time, until all the valuables were secured, were gathered up by the people in the vicinity and used for fuel.

Some person, with a better knowledge of woods than his neighbors, conjecturing that the logs were certainly designed for a more profitable purpose than to cook fishermen's dinners, brought a chip to Boston, and showed it to Mr. R., whose business was, and still is, the preparation of blocks for wood engravers.

"Do you mean to say, sir," said he, "that people are using this wood for fuel?"

"That's just what they're doing of," was the reply.

"Is there much more left?" was the next eager euquiry.

"A few more logs, I should say."

Without another word Mr. R. put on his hat and coat, took the first conveyance for Cape Cod, and reached it in time to secure a valuable prize. They were actually burniug fuel that was worth $800 a cord!

It was indeed the finest and best quality of Turkey boxwood, which to-day would readily bring twelve cents a pound.

SWEDISH FORESTS.

The Stockholm correspondent of the *Timber Trades Journal* says:—We have not lately heard much of the fears expressed a few years ago, that we were cutting down our timber much faster than same was growing, and it becomes a very interesting question, both for your side and ours, whether, for instance, the district of country situate within the range of the Dal Rivers on the south aud Augerman River and its tributaries on the north, can permanently sustain a production which, last season, was about 550,000 Petersburg standards of sawn wood alone. The total forest-bearing grouud within the above district was calculated by a competent official authority at about 15,350,000 English acres in 1880, with an estimated mass of growing wood of all sizes, from fifteen years growth and upwards, of about 47,000,000,000 cubic feet. Those of your readers who are inclined to follow up the calculation for themselves will be able to form an idea as to whether the fears expressed of a timber-scarcity in a generation or so have any foundation in fact or not.

Lumberman's Profits.

The following letter appears in the Ottawa *Free Press*:—

"Sir,—I see by a paragraph in your paper of yesterday—given as if by authority—that I had realized three hundred thousand dollars by my business last year. It would be very gratifying to me to be able to confirm that statement, but truth compels me to say one quarter of the amount would satisfy me for all my trouble and worry of the past year, and would be nearer the truth. Please give this an insertion, and oblige,

J. R. BOOTH.

Ottawa, March 21, 1883.

Forest Fires.

When the order was called in the Quebec Legislature for the third reading of the bill to provide the means for the effectual prevention of forest fires, the Hon Mr. Lynch asked that the bill be referred back to committee to insert a clause, which had been agreed to between himself and the member for Lotbiniere, as well as recommended by the late Forestry Congress, and which he would have moved if he had been present at the last sitting. He explained that this clause was to compel railway companies to clear away, under a heavy penalty, all combustible matter for a certain distance on each side of their tracks in the five districts.

The House accordingly reformed into committee, when a good deal of discussion, mostly of a conversational character, on various features of the measure, ensued, the bill being reported, read a third timo and passed.

BOOMS IN NAVIGABLE WATER.

The following is the bill introduced into the Dominion Senate respecting booms and other works constructed in navigablo waters under the authority of Provincial Acts:—

1. No boom, wharf, dam or aboiteau hereafter constructed under the authority of an Act of a Legislature of a Province of Canada, or under the authority of an Ordinance of the North-West Territories or of the Distriet of Keewatin, shall, so far as the same may interfere with navigation, be a lawful boom, wharf, dam or aboiteau, unless the site thereof has been approved, and unless the boom, wharf, dam or aboiteau has been built and is maintained in accordance with plans approved by the Governor General in Council.

2. Any boom, wharf, dam or aboiteau heretofore or hereafter constructed under the authority of an Act of a Legislature of a Province of Canada, or under the authority of an Ordinance of the North-West Territories or of the District of Keewatin, shall, so far as the same may interfere with navigation, be a lawful boom, wharf, dam or aboitcau, if the site thereof has been approved, and if the boom, wharf, dam or aboiteau has been built and is maintained in accordanee with plans approved by the Governor General in Counoil.

3. The local authority, company or person proposing to construct the boom, wharf, dam or aboiteau shall deposit the plans thereof and a description of the proposed site with the Minister of Marine and Fisheries, and may apply to the Governor General in Council for approval thereof.

4. The Governor General in Counoil may, from time to time, make and alter such regulations as may be deemed expedient, respecting the opening of any swing or draw within the purview of this Act; and the local authority, company or person constructing or owning, or in possession of the boom, as the case may be, shall be subject to such regulations.

5. Any boom, wharf, dam or aboiteau within the purview of this Act which is built upon a site not approved by, or which is not built in accordanee with plans approved by, the Governor General in Council, or which, having been so built, is not maintained in accordanee with such plans may, in so far as the same interferes with navigation, be lawfully removed and destroyed under the authority of an order of the Governor General in Counoil.

6. The preceding section shall not limit the jurisdiction of any court with respect to the removal and destruction of any unlawful boom, wharf, dam or aboiteau.

7. Parliament may, at any time, annul or vary any order or approval of the Governor General in Counoil made under this Act; and any action of Parliament in that behalf shall not be deemed an infringement of the rights of the local authority, company or person concerned.

8. This Act shall not affect any boom, wharf, dam or aboiteau heretofore lawfully constructed, which may hereafter require to be rebuilt or repaired, provided such boom, wharf, dam or aboiteau, when so rebuilt or repaired, shall not interefere more injuriously with navigation than now or heretofore.

9. Each boom, wharf, dam or aboiteau heretofore constructed under the authority of an Act of a Legislature of a Province of Canada, passed since the first day of July, 1867, or under the authority of an Ordinance of the North-West Territories or of the Distriet of Keewatin, shall, so far as the same may interfere with navigation, be a lawful boom, wharf, dam or aboiteau for and during three months from the passing of this Act.

ii. Nothing herein shall be construed to make any sueh boom, wharf, dam, or aboiteau, so far as it interferes with navigation, a lawful boom, wharf, dam or aboiteau after the expiry of the said three months, unless the site and plan have been approved as herein provided.

iii. Any boom, wharf, dam or aboiteau now the subject of litigation on the ground that it is an interference with navigation, is excepted from the operation of this section, and nothing herein shall prejudicially affect the rights of any parties in regard to sueh litigation.

10. The word "boom" includes works necessary and appurtenant thereto; the word "wharf" includes piers, jetties, moles and breakwaters; the word "dam" includes the works necessary and appurtenant thereto; and the word "aboiteau" includes dykes and other works of a similar character.

ENGLAND alone, where trees are planted along every fence-row almost, and over each hill, and carefully protected, so that most of the country appears embowered in foliage; where iron is used in lieu of wood on a vast scale, and where the forests of Northern Europe are within easy sale, yet pays annually no less than $100,000,000, it is said for imported lumber.

TIMBER and other Consignments, and Agencies WANTED. Highest references. Address "Kaisar" care of Messrs. Deacon & Co., 150 Leadenhall Street, London, England. 3L7

Wanted.

THOMAS JOWITT & SONS

VALUABLE
TIMBER LIMITS
FOR SALE,
Situated in the Nipissing District.

The following very desirable limits will be offered for sale at Public Auction (if not previously disposed of) at the

Grand Union Hotel, Ottawa, Ont.
—ON—
TUESDAY, 24th Day of April, 1883,
At 2.30 O'CLOCK IN THE AFTERNOON.

Berth No. 23, Nipissing.....36 square miles
do 43, Georgian Bay.....36 do
do 51, do .....36 do

BERTH 23 is heavily timbered and is very favourably situated for lumbering. The Canadian Pacific Railway crosses the south-west corner of the limit, and parties desirous of unanufacturing lumber for shipment to Manitoba aud the North-West would find this an excellent opportunity for establishing such a business. There is said to be a good mill site on the berth, with good facilities for piling and for shipping either west or east.

BERTHS 43 and 51 are adjacent limits, conveniently located for getting logs into Georgian Bay.

The terms and conditions of sale will be made known at the time of sale.

Further particulars may be had on application to Mr. W. H. Rowley, Manager of the Merchants' Bank of Canada, at Ottawa, Mr. Wm. Cooke, Manager at Toronto, or to

R. C. W. MacCuaig,
Auctioneer, Ottawa.
February, 28th, 1883. 3t6

LEGISLATION FOR BOOM COMPANIES.

Hon. Mr. Mitchell, in the House of Commons asked leave to present a petition permitting the Quaddy Boom Company, of New Brunswick, to seek legislation from Parliament. He explained that for years past the local legislaturos have given charters to boom companies, but a doubt having recently arisen as to the jurisdiction of the legislatures over navigable waters, a test case is now before the Supreme Court, and in the course of the argument the judges dropped such hints as led to the opinion that the judgment of the New Brunswick Court, declaring these charters *ultra vires*, will be sustained. The consequence will be that, unless the Dominion Parliament gives the companies an Act of incorporation, an immense quantity of valuable timber will be exposed to the mercy of any reckless or miliciously disposed person who may cut the booms employed to catch and retain the logs as they float down the streams. Sir Leonard Tilley explained that recognizing the importance of this question, a deputation of New Brunswick members had waited upon the Minister of Justice to ask that the rights of the boom companies should be protected until legislation by Parliament could be obtained. The Government does not intend this session to introduce legislation of a general character in relation to the subject, but they would take the proper steps to protect the rights of the boom companies in the event of the Supreme Court declaring their provincial charaters of incorporation *ultra vires*.

DOMINION PUBLIC LANDS.

The following are the portions referring to timber and timber lands, of the bill introduced by Sir John Macdonald for consolidating and amending the Acts respecting the public lands of the Dominion.

WOOD FOR SETTLERS.

46. And whercas it is expedient that the timber in townships thrown open for settlement, should be so disposed of as to benefit the greatest possible number of settlers, it is therefore enacted as follows:—

1. The Minister of the Interior may direct that in the submission of townships which consist partly of prairie and partly of timber land, the timber lands shall be divided into wood lots of not less than ten, and not more than twenty acres each, in such manner as to afford, as far as practicable, one such wood lot to each quarter-section prairie farm.

2. Provided, that if a quarter-section be found to contain timber-land not exceeding in extent twenty-five acres, such timber land shall be appurtenant to such quarter-section and shall not be divided into wood-lots;

3. Out of any wood lots set apart under sub-clause one of this clause, the Local Agent shall, on application, apportion a wood lot to each settler on a homestead quartor section not having on it more than ten acres of woodland, and such wood lot shall be paid for by the applicant at the price for wood lots fixed at the time by the Minister of the Interior, and shall be entered in the books of the Local Agent, and be given by him, in his returns, as appertaining to such homestead quarter-section, and on the homestead claimant fulfilling all the requirements of this Act in that behalf, but not otherwise, a patent shall issue to him for such wood lot; Provided always, that any person to whom a wood lot was apportioned, in connection with a homestead under the provisions of sub-clause five of clause forty-six of "*The Dominion Lands Act of* 1872," having duly fulfilled the conditions of such homestead grant, shall receivo a patent for such wood lot as a free grant, as provided in the said sub-clause, notwithstanding the repeal of the said sub-clause by the Act thirty-seventh Victoria, chapter nineteen; Provided further, that the cancellation of a homestead entry shall carry with it the cancellation of the entry of the wood lot which may have been apportioned thereto, and also the forfeiture of the purchase money of such wood lot;

4. Provided, that any holder of a homestead entry, who previous to the issue of the patent, shall sell any of the timbor on either his homestead or pre-emption quarter section, or on the appurtenant wood lot, to saw-mill proprietors or to any other than settlers for their own private use, without having previously obtained permission so to do from the Minister of the Interior, shall be guilty of a trespass, and may be prosecuted therefor before a Justice of the Peace, and upon conviction thereof, shall be subject to a fine not exceeding one hundred dollars, or to imprisonment for a term not exceeding six months, or to both fine and imprisonment at the discretion of the Court; and further, such person shall forfeit his homestead and pre-emption rights, and the timber so sold shall be subject to seizure and confiscation in the manner provided by clause *sixty-six* of this Act. 1879, s. 47.

TIMBER BERTHS.

47. In the enactments and provisions in the twenty-four next following clauses the word "timber" means all wood and all products thereof. 1879, s. 50.

48. The Governor in Council may, from time to time, declare districts of territory to be timber districts, and no lease of a timber berth shall be granted except within timber districts so set apart. 1879, s. 48.

49. The Minister of the Interior may set apart any tract of land in any timber district, and may cause the same to be divided into timber berths not exceeding in area fifty square miles each; and the same shall be reserved from sale and settlement; and, under such regulations as may be made by the Governor in Council respecting the ground rents, royalties, or other dues which are to be paid in connection therewith, leases of the right to cut timber on such berths may be granted as hereinafter provided. 1879, s. 49.

50. The Governor in Council may, from time to time, order that leases of the right to cut timber on certain timber berths defined in the order shall be offered at public auction at an upset bonus fixed by the order, and given to the person bidding, in each case, the highest bonus therefor, such bonus to be paid in cash at the time of sale. The Governor in Council may also authorize the lease of the right to cut timber on any timber berth to any person who is the sole applicant to be fixed in the order authorizing the lease to him, and to be paid in cash at the time of its issue;

2. When one or more persons apply for the right to cut timber upon the same timber berth, the Governor in Council may authorize the Minister of the Interior to invite tenders from the applicants; and the one tendering the highest cash bonus therefor, not being less than the upset bonus fixed, as in the next preceding sub-clause provided, shall be entitled to the lease. 1879, s. 51.

51. In cases where applications may be made for limits on which to cut timber in unsurveyed territory, the Governor in Council may, on the recommendation of the Minister of the Interior, authorize the same to be leased for such bonus as may be deemed fair and reasonable,—such leases to be subject, nevertheless, to the conditions of this Act respecting timber berths, except as to that part of clause *fifty-four*, which provides for the erection of mills, which provision, in respect to limits in unsurveyed territory may, if considered expedient by the Minister of the Interior, be dispensed with;

2. Territory in which the block outlines only of townships may have been run and marked, shall be considered surveyed territory, and the Governor in Council may, on the recommendation of the Minister of the Interior, in special cases where the same may be deemed expedient, grant licenses in either surveyed or unsurveyed territory, as the case may be, to cut timber for one year, at such ground rent as the Minister may deem fair and reasonable,—such license to be subject in all respects to the other provisions of this Act, except where the same may be inconsistent herewith. 1879, s. 52.

52. Leases of timber berths shall be for a term not exceeding one year, and the lessee of a timber berth shall not be held to have any claim whatever to a renewal of his lease unless such renewal is provided for in the Order in Council authorizing it, or embodied in the conditions of sale or tender, as the case may be, under which it was obtained;

2. Renewal of a lease shall not be given in any case where the lessee has failed to pay any ground rent, royalty, or other dues in connection therewith. (*New.*)

53. The lease shall describe the lands upon which the timber may be cut, and shall, during its continuance, vest in the lessee all right of property whatsoever in all trees, timber, wood or other products of wood cut within the limits of the leasehold, whether such trees, timber and wood or products be cut by his authority or by any person without his consent; and such lease shall entitle the lessee to seize in replevin, revendication, or otherwise, as his property, such timber where the same is found in the possession of any unauthorized person, and also to bring any action or suit, at law or in equity, against any party unlawfully in possession of any such timber, and to prosecute all persons cutting timber in trespass upon his lease to conviction and punishment, and to recover damages, if any; and all proceedings pending at the expiration of any such lease may be continued and completed as if the lease had not expired. 1879, s. 52.

54. The lease shall contain, in addition to such other provisions as may be in the Order in Council granting it, or in the conditions of sale or tender under which it was obtained, provisions binding the lessee:—

1. To erect in connection with the berth leased, and to have in operation within a time prescribed in the lease, a saw mill or mills of capacity to cut in twenty-four hours a thousand feet, board measure, for every two and a-half square miles of the area leased; or to establish such other manufactory of wood goods as may be accepted by the Minister of the Interior as equivalent thereto;

2. To pay in advance, in addition to the bonus, an annual ground rent of five dollars per square mile, and further, to pay in cash, at each time of his making the return prescribed in sub-clause *four* of this clause, a royalty of five per cent. on his sales of the products of the berth as shewn by such return;

3. To keep correct books of account of his business, and to submit the same for the inspection of any authorized agent of the Minister of the Interior, whenever required;

4. To make monthly, or at such other interval of time as they may be required of him, by regulations under this Act, or by the Minister of the Interior, returns sworn to by him or by his agent or employee cognizant of the facts, declaring the quantities taken from the berth, and those sold, of all timber or products of wood, in whatever form the same may be sold or otherwise disposed of by him during such month or other period, and the amount received by him therefor;

5. To prevent any unnecessary waste of timber in the process of cutting it, and to prevent, when it can be avoided, the destruction of growing trees which have not yet attained a size fitting them to be used for merchantable timber;

6. To exercise strict and constant supervision to prevent the origin and spread of fire. 1879, s. 52.

55. If, in consequence of any incorrectness in survey, or other error or cause whatsoever, a lease is found to comprise lands included in another lease of prior date, or any lands sold, granted, leased or lawfully set apart for any other purpose under this Act, the later lease shall be void in so far as it interferes with any previous lease, sale, grant or setting apart. 1879, s. 53.

56. Every lease of a timber berth shall be subject to the right of the Government to deal, in accordance with the provisions of this Act and regulations made under it by the Governor in Council, with any and all coal and other minerals which may be found within the limits of the berth leased; and the Government shall have the right in dealing, as above provided, with any coal or other minerals in lands leased as timber limits, to authorize the persons to whom such coal or other minerals may be granted, to take possession of and occupy such extent of the land so leased as may be necessary to work such coal or other minerals, and to open necessary roads through any such timber berth, paying the lessee of the berth the value of any and all timber necessarily cut in making such roads or in working the mines; and the provisions of this clause shall operate retrospectively, that is to say, they shall apply to all leases of timber berths heretofore granted under any Act respecting Dominion Lands, as if they had been contained in such Act when it was passed. 1880, s. 7.

57. Every lease shall be subject to forfeiture for infraction of any one of the conditions to which it is subject, or for any fraudulent return; and in such case the Minister of the Interior shall have the right, without any suit or other proceeding at law or in equity, or compensation to the lessee, to cancel the same, and to make a new lease or disposition of the limit described therein, to any other party, at any time during the term of the lease so cancelled: Provided, that the Minister of the Interior, if he sees fit, may refrain from forfeiting such lease for non-payment of dues, and may enforce payment of such dues in the manner by this Act provided. 1879, s. 52.

58. Any ground-rent, royalty, or other dues, on timber cut within the limits of any timber berth, which are not paid at the time when they become due, shall bear interest at the rate of six per cent. per annum until paid, and shall be a lien on any timber cut within such limits; and in case of such non-payment—whether, in consequence, the lease of the berth has or has not been cancelled—the Crown timber agent or other person authorized thereto may, with the sanction of the Minister of the Interior, seize so much of the timber cut on such berth as will, in his opinion be sufficient to secure the payment of such rent or royalty, and all interest and expenses of seizure and sale, and may detain the same as security for the payment thereof; and if payment be not made within three months after such seizure, he may, with the sanction of the Minister of the Interior, sell such timber by public auction, and after deducting the sum due to the Crown, the interest thereon, and expenses aforesaid, he shall pay over the balance, if any, to the lessee, if the timber was in his possession at the time of seizure, or if it was not so, to the person who had possession thereof at that time. 1879, s. 54.

59. All timber cut under lease shall be liable for the payment of the Crown dues thereon, so long as, and wheresoever, the said timber, or any part of it, may be found, whether it be, or be not, converted into deals, boards, or any other manufacture of wood; and all officers or agents employed in the collection of such dues may follow all such timber and may seize and detain the same wherever it be found, until the dues thereon are paid or secured as provided in the next preceding clause. 1879, s. 55.

60. And in case the payment of the Crown dues on any timber has been evaded by any lessee or other party, by the removal of such timber or products out of Canada, or otherwise, the amount of dues so evaded, and any expenses incurred by the Government, in enforcing payment of the said dues under this Act, may be added to the dues remaining to be collected on any other timber cut on any timber berth by the lessee or by his authority, and may be levied and collected or secured on such timber, together with such last-mentioned dues, in the manner provided by clause *fifty-eight*: or the amount due to the Crown, of which payment has been evaded, may be recovered by action at law in the name of the Minister of the Interior or his agent, in any court having jurisdiction in civil cases to the amount. 1879, s. 56.

61. The Minister of the Interior may take, or authorize the taking of, bonds or promissory notes for any money due to the Crown, as aforesaid, or in his discretion, for double the amount of any dues, fines and penalties and costs incurred or to be incurred, and may, if it be under seizure, then release any timber upon which the same would be leviable: but the taking of such bonds or notes shall not effect the right of the Crown to enforce payment of such money, and the debt shall be a lien on any timber cut on the same or any other berth, by the lessee or by his authority, if the sums for which such bonds or notes are given are not paid when due. 1879, s, 57.

LIABILITY OF PERSONS CUTTING TIMBER WITHOUT AUTHORITY.

62. If any person without authority cuts, or employs or induces, any other person to cut, or assist in cutting, any timber of any kind, on Dominion lands, or removes or carries away, or employs, or induces, or assists, any person to

remove or carry away any timber of any kind so cut, he shall not acquire any right to such timber, or any claim for remuneration for cutting the same, preparing the same for market, or conveying the same to or towards market; and when the timber has been removed out of the reach of the Crown timber officers, or it is otherwise found impossible to seize it, he shall in addition to the loss of his labor and disbursements, pay a fine not exceeding three dollars for each tree which, or any part of which he is proved to have cut or carried away, or assisted to cut or carry away; and such sum shall be recoverable, with costs, at the suit and in the name of the Crown, in any court having jurisdiction in civil matters to the amount of the penalty; and in all cases the burden of proof of authority to cut and take the timber shall lie on the party charged; and the averment of the party seizing or prosecuting, that he is duly employed under the authority of this Act, shall be sufficient proof thereof, unless the defendant proves the contrary. 1879, s. 58.

63. Whenever satisfactory information, supported by affidavit made before a Justice of the Peace, or before any other competent officer or person, is received by any Crown Timber Officer or Agent, that any timber has been cut without authority on Dominion lands, or if any Crown Timber Officer or Agent, from other sources of information, or his own knowledge, is aware that any timber has been cut without authority on any such lands, he may seize, or cause to be seized in Her Majesty's name, the timber so reported or known to be cut, wherever it is found, and place the same under proper custody, until a decision can be had in the matter by competent authority.

2. And where the timber reported or known to have been cut without authority, has been made up with other timber into a crib, dram, or raft, or in any other manner has at any mill or elsewhere, been so mixed up with other timber as to render it impossible or very difficult to distinguish the timber so cut without authority, from the other timber, the whole shall be held to have been cut without authority, and shall be liable to seizure and forfeiture accordingly, until the holder shall have separated, to the satisfaction of the Crown Timber Agent, the one timber from the other. 1879, s. 58.

64. Whenever any Crown Timber Agent, or other officer or agent of the Minister of the Interior, is in doubt as to whether any timber has, or has not, been cut without authority, or is, or is not, liable to Crown dues on the whole or any part thereof, he may enquire of the person or persons in possession, or in charge, of such timber, as to when and where the same was cut; and if no satisfactory explanation, on oath or otherwise, as he may require, be given to him, he may seize and detain such timber until proof be made to the satisfaction of the Minister of the Interior, or of such Crown Timber agent or officer, that such timber has not been cut without authority, and is not liable, either in whole or in part, to Crown dues of any kind; and if such proof be not made within thirty days after such seizure, such timber may be dealt with as timber cut without authority, or on which the Crown dues have not been paid, according to the circumstances of the case, and the dues thereon may be recovered as provided in the *fifty-eighth* clause. 1879, s. 62.

65. In case any timber, or any product thereof, is seized under the provisions of this Act by any Crown Timber Agent or Officer, he may allow such timber or product thereof to be moved and disposed of, on receiving sufficient security, by bond or otherwise to his satisfaction, for the full value thereof, or in his discretion, for payment of double the amount of all dues, fines, penalties and costs incurred or imposed thereon. as the case may be, 1879, s. 58.

66. All timber seized under this Act on behalf of the Crown as being forfeited, shall be deemed to be condemned unless the owner thereof, or the person from whom it was seized, within one month from the day of the seizure, gives notice to the seizing officer, or to the Crown Timber Agent or Officer under whose authority the seizure was made, that he intends to contest the seizure. If, within fifteen days days thereafter, the claimant shall not have instituted proceedings before a court of competent jurisdiction to contest the seizure, or if the decision of the Court be against him, or should the claimant fail duly to prosecute such proceedings in the opinion of the Judge before whom such case may be tried (and who may for that cause dismiss the suit on the expiration of three months from the date on which it was instituted,—anything to the contrary hereinbefore enacted notwithstanding), the timber may be confiscated and sold for the benefit of the Crown, by order of the Minister of the Interior, after notice on the spot of at least thirty days: Provided nevertheless, that the Minister of the Interior, should he see cause for doing so, may, instead of confiscating timber cut without authority on Dominion lands, impose a fine, or penalty which, in addition to all costs incurred, shall be levied on such timber; and in default of payment of the whole on demand he may, after a notice of fifteen days, sell such timber by public auction, and may, at his discretion, retain the whole proceeds of such sale, or the amount of penalty and costs only. 1879, s. 61.

67. And whenever any timber is seized for non-payment of Crown dues, or for any cause of forfeiture, or any prosecution is instituted for any penalty or forfeiture under this Act, and any question arises whether the said dues have been paid on such timber, or whether the said timber was cut on other than any of the Dominion lands aforesaid, the burden of proving payment, or of proving on what land the said timber was cut, shall lie on the owner or claimant of such timber. and not on the officer who seizes the same, or the party instituting such prosecution. 1879, s. 63.

68. An officer or person seizing timber in the discharge of his duty under this Act may, in the name of the Crown, call in any assistance necessary for securing and protecting the timber so seized; and if any person under any pretence, either of assault, force, or violence, or by threat of such force or violence, in any way resists or obstructs any officer or person acting in his aid, in the discharge of his duty under this Act, such person shall be guilty of felony, and, being convicted thereof, shall be punishable accordingly. 1879, s. 59.

69. If any person, whether pretending to be the owner not, either secretly or openly, and whether with or without force or violence, takes or carries away, or causes to be taken or carried away without permission of the officer or person who seized the same or of some competent authority, any timber seized and detained for any lawful cause under this Act, before the same has been declared by competent authority to have been seized without due cause, such person shall be deemed to have stolen such timber, the property of the Crown, and to be guilty of felony, and, being convicted thereof, shall be punishable accordingly. 1879, s. 60.

SLIDES, ETC.

70. No sale or grant of any Dominion lands shall give or convey any right or title to any slide, dam, pier or boom, or other work previously constructed on such land, or on any stream passing through or along it, for the purpose of facilitating the descent of timber or saw-logs, unless it be expressly mentioned in the letters patent or other documents establishing such sale or grant, that such slide, dam, pier or boom, or other work, is intended to be thereby sold or granted.

2. The free use of slides, dams, piers, booms or other works on streams, to facilitate the descent of lumber and saw-logs, and the right of access thereto for the purpose of using the same and keeping them in repair, shall not in any way be interrupted or obstructed by, or in virtue of, any sale or grant of Dominion lands made subsequent to the construction of such works. 1879, s. 64.

71. The free use, for the floating of saw-logs or other timber, of all streams and lakes that may be necessary for the descent thereof from Dominion lands, and the right of access to such streams and lakes, and of passing and repassing on or along the land on either side, and wherever necessary for such use thereof, and over all existing or necessary portage roads past any rapids or falls, or connecting such streams or lakes, and over such roads as owing to natural obstacles, may be necessary for taking out timber from Dominion lands, and the right of constructing slides where necessary, shall continue uninterrupted, and shall not be affected, or obstructed by, or in virtue of, any sale or grant of such lands. 1879, s. 65.

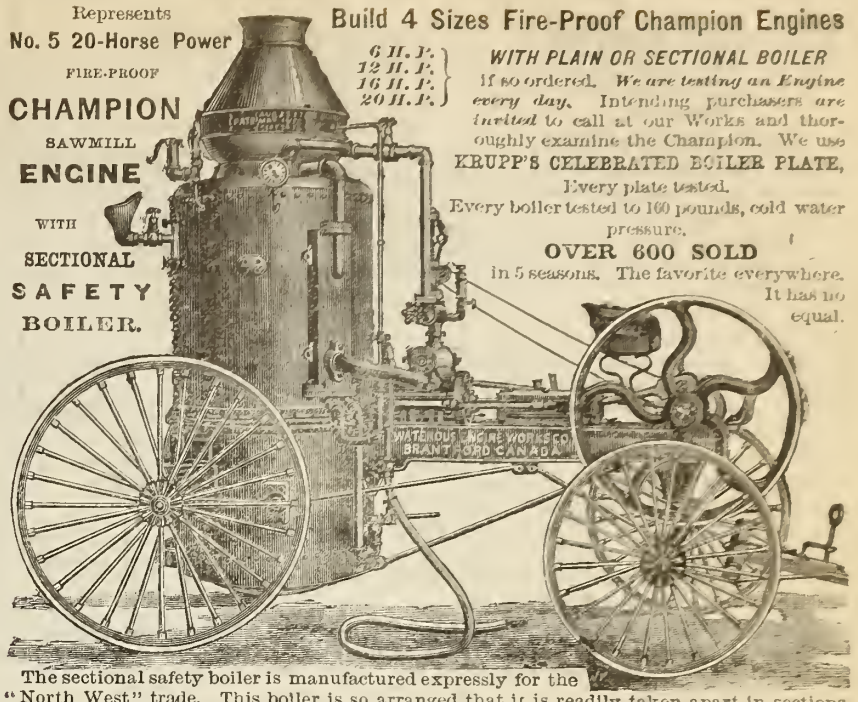
If so ordered. *We are testing an Engine every day.* Intending purchasers *are invited* to call at our Works and thoroughly examine the Champion. We use KRUPP'S CELEBRATED BOILER PLATE,
Every plate tested.
Every boiler tested to 160 pounds, cold water pressure.
OVER 600 SOLD
in 5 seasons. The favorite everywhere. It has no equal.



The sectional safety boiler is manufactured expressly for the "North West" trade. This boiler is so arranged that it is readily taken apart in sections enabling purchasers to clean thoroughly every part of it and prevent burning out. *We know from experience this is absolutely necessary with the alkaline waters of the great Western prairies.* Largely used by the Pacific Railway Company and all the large Colonization and Ranche Companies.

HOUSES IN THE KNOCK-DOWN.

Though the Canadians are now seemingly the the most actively engaged in the business of manufacturing houses in the knock-down, the idea is an old one, and was carried into effect in various countries years ago. More or less is done in that way in Mexico, and something in the United States. Information on the subject comes from various quarters, and Switzerland affords some interesting facts. In that country chalets—the French term for a style of mountain hut—are made in sections, fancifully carved, and so arranged as to be readily conveyed anywhere and put together with great facility, being so lightly constructed as to be capable of dismemberment and ready removal from one place to another. The subject of the art of carving in this connection is reviewod in a letter from a Swiss correspondent to the London *Times*, as follows:

"The first attempt to introduce wood-carving into Berne was made half a century ago by Christian Fischer, of Brienz, who may be called the father of the art, for after acquiring it himself he taught it to others and founded a school. Besides being an artist in wood, Fischer taught music, made musical boxes, and practised the healing art, but, like many other clever fellows, he died in poverty. Some time after Fischer commenced wood-carving at Brienz, a certain Peter Baumann began at Grindelwald the making of the miniature Swiss chalets which are now so popular. He afterwards removed to Meyringen, where he taught his art to his three sons, one of whom, Andreas, proved to be a genius of the first order, and was equally distinguished for originality in design and skill in execution. He was the first to practice carving in relief. His roses are still regarded as masterpieces, and serve as models for young sculptors. The success of the Baumanns encouraged others to follow their example, and wood-carving soon became a winter occupation in nearly every cottage of the valley of the Hasli. But the sale of carvings and chalets being restricted to foreign tourists in the summer season, principally through the intermediary of hotel porters, the trade for a long time was limited and unremunerative. But it struggled on, and in the course of time attracted the attention of local capitalists, who started workshops, opened depots for the sale of their products, and began an export trade, which, with some fluctuations, goes on steadily increasing. The business of wood-carving now finds employment for several thousand individuals. In one establishment alone—that of the brothers Worth—300 to 400 sculptors of both sexes are regularly occupied. Each has his or her speciality, the choice of which is left to the individual taste. Some have an aptitude for and excel in the modeling of groups of animals; others give this attention to flowers and plants; others, again, prefer to carve ornamental caskets and build miniature chalets. The women have great delicacy of touch, and their work in certain branches is preferred to that of men. One thing leads to another, and the abundance of certain sorts of wood in the district suggested the idea of adding to wood-carving the production of what may be called fancy furniture—carved chairs and tables, napkin rings and such like articles. A factory has been started at Interlaken, and is now in successful operation for making habitable chalets on a large scale. You have only to select your design, give your order, and all the parts of a chalet are sent to any destination, so arranged and marked that an intelligent joiner can put them together, and you have a handsome and picturesque house which you may live in as long as you like, and even carry about on your travels."

Outside of what has been done in the direction of establishing manufactories where houses in the knock-down are turned out to order, as in Canada, it is not au uncommon thing for persons removing to new countries to prepare the timbers aud various pieces for a proposed house, put them together to make sure that the main elements of the structure will jibe, and reducing the prospect of tinkering to about the minimum, then shipping the disjointed dwelling to the destined poiut, oftentimes saving a large amount of trouble and cost, to say nothing of time. Contractors who are in the habit of figuring on house bills uuderstaud the case so thoroughly in most instauces that it is an easy matter to furnish a house of this kind so that it may be put together satisfactorily; and as the raw material must always go to the site of a proposed building. it is about as cheap to send it ready-made, along with a few pounds of nails and incideutals, as any other way. This custom will no doubt become more general in the future.—*Northwestern Lumberman.*

Letter from Member of Congress.

HOUSE OF REPRESENTASIVES,
Washington, D.C., Feb. 19, '82.

GENTLEMEN,—Inclosed find $1, and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a bad cold, as has almost every one else here, but canuot find the Elixir, which I used frequently at home and consider a most valuable medicine; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GROUT.

Market Reports.

TORONTO.

From Our Own Correspondent.

MARCH 23.—The continuation of severe wintry weather at a time when we naturally look for some signs of spring keeps building operations suspended to a considerable extent, and factory men, together with master builders, feel inclined to grumble somewhat at the long delay. All the architects' offices are fairly busy and a number of good contracts have already been let, and only await favorable weather to commence work with viger. The retail yards, notwithstanding this partially enforced suspension of building, are doing a good stroke of business and purchase all the lumber now coming forward by rail, which by reason of the snew blockades from time to time is quite limited, and, doubtless, many of the mills will be fully a month later than usual in starting up through the extreme depth of snow and generally severe frost throughout the lumbering districts. It now looks extremely doubtful if our harbor will be open much before the middle of April, as the ice is of unusual thickness and remains as firm as at any time during the winter.

Prices at the yards remain firm and the general feeling is one of hopefulness, and should our trade open up satisfactorily with our American neighbors the prices on bill stuff will stiffen as the season advances.

OSWEGO, N. Y.

From Our Own Correspondent.

MARCH 23.—Since last advices trade has improved, and a good many orders are booked for delivery on opening of canal. So far prices are held firm though it is generally conceded that the stocks to arrive will be sold cheaper, as there has been a decline of from one to two dollars in Chicago and at the principal Michigan markets. The season is very backward, and no signs of opening of navigation. Our canals cannot be got in readiness before 1st of May.

There are no changes from last quotations:—

CHICAGO.

The *Northwestern Lumberman* of March 24, says:—Trade is considered to be in a healthy state. The revival of demand and prospect of an active season leads holders to view their stocks with more complacency. They are now too busy to grumble much. Prices have possibly touched bottom, and future changes are likely to be for the better. The dealers have had a dose of medicine that has toned up the mercantile system. They don't propose in the near future to be to anxious about laying in stocks. In this respect they are in better condition than they were last spring, when a craze to buy had induced them to load up with stocks over the lake, on dock or in the log, which handicapped them for an entire year. The business they propose to do this year will be of a solid character, and speculation will not be as rife as it was last season. This cannot fail to have a solidifying effect on values, providing no general financial collapse checks the demand later on. Prices may not be much higher, but they will have more tone and integrity. Some even assert that the process of toning up has already begun in prices made to country customers, as well as between dealers, but it is probably wiser to reserve a conclusion on this point until further developments.

BOSTON.

Cotton, Wool and Iron of March 24, says:—There is no particular change to chronicle since our last. The weather is rather an unfavorable element, being backward for the season and very variable and threatening. However, the general feeling is that there is to be a very good spring trade, and it is already opening up well despite the unfavorable elements. Prices on general eastern and western soft wood supplies are quite steady, not to say firm, and the demand is good and improving. Hardwoods of desirable grades are also selling well at firm prices.

BRISTOL.

Messrs. King Brothers' March circular contains the following remarks:—The demand for timber during the past month has been extremely quiet, and what few sales have been made partake generally of a retail character. Quebec goods.—Yellow pine timber—Both waney board pine and common are quite neglected. Red pine—No business. Oak is not inquired for. Elm and birch—None in this market, and the same remarks apply to ash and walnut. Pine deals are moving but slowly at late values. New Brunswick goods.—Spruce deals—The somewhat easier prices elicit but a poor inquiry; stocks are moderate. Pine deals—No stocks. Birch—A cargo has lately arrived, for which there has been a fair demand. United States goods—Pitch pine timber—For hewn there has been very little demand. Sawn has been in moderate request, and a fair quantity has passed into consumption. Deals are quiet. Black walnut—A fresh parcel of prime wood has just arrived, and is now being landed. Whitewood in logs is in small request, but planks are neglected. Oak logs—The market is now cleared. Ash—There has been a fresh arrival, which meets with a fair demand. Wainscot logs are in a trifle better request. Oak planks are not in general demand, but those in special sizes secure attention. Staves are not in such good request. The later arrivals have been of poor quality, and have sold ex ship at corresponding values. The arrivals for the past month consist of one vessel from New Brunswick, 573 tons register, against two vessels, 1,384 tons register, for the corresponding month last year, showing a decrease of 811 tons register.

GLASGOW.

The *Timler Trades Journal* of March 10, says:—There has been only one cargo of pitch pine imported to Clyde this year to date. In the first two months of 1882 four cargoes had arrived, and in the same period of 1881 eleven cargoes. Next statement of stock (to be made up in a few weeks) will, no doubt, show a considerable diminution of pitch pine, compared with the large total in last statement. Prices, however, as yet, do not seem to improve.

An auction sale was held here on the 7th inst., the catalogue comprising Canadian pine and spruce deals, oak planks, and wainscot billets. The business done was limited, a large portion of the catalogue remaining unsold, buyers still appearing unwilling to meet brokers' views as to prices. For the oak planks and billets there was no demand by the company present:—

Ottawa 1st yellow pine deals—			
12 to 19 ft.	6/10×3	2s. 4d.	per c. ft.
Do. yellow pine planks—			
13 to 10 ft.	5/21×2	2s. 3d.	"
10 " 12 "	5/20×2	2s. 1½d. & 2s. 1d.	"
Do. 2nd yellow pine deals—			
14 to 16 ft.	11×3	2s. 1d.	"
9 " 11 ft.	11×3	1s. 9d.	"
Do. 4th yellow pine deals—			
10 to 16 ft.	12/23×3	1s. 1d.	"
Caraquet, N. B., 3rd yellow pine deals—			
12 ft.	8×3	1s.	"

LIVERPOOL.

The *Timber Trades Journal* of March 10th says:—During the past week there has apparently been some relaxation of business, as the railways and other forwarding companies do not appear to be quite so busy as they were last month; still, there is a fair amount of business being done in a quiet way, for no sooner is an order sent into the wharves than it is picked up and forwarded before it is noticed.

During last month many people were saying that there was next to nothing doing, but when the statistics came out at the end of the month, as particularized below, showing that a fair trade had been done, endeavours were made to show that the consumption was a six weeks' and not a four weeks' consumption. That there is a substratum of truth in this no one will deny who is conversant with the trade here, and this can be made clear when it is explained that the annual stock is taken, nominally, on the 28th February, by actual estimation of all stocks in merchants' and brokers' yards, it must take some considerable time to do it in, which is generally about a fortnight; so that some stocks are estimated in the middle and others at the end of the month; therefore we may fairly take the consumption of the month of February as set forth in the table as being that of five weeks; but this same argument applies to the year 1882, and, therefore, for sake of comparison between the month of February in 1882 and 1883, the figures stand good for all practical purposes.

The arrivals continue very small, and consist principally of oak planks, sent forward by steamers trading between this port and Baltimore, and of mahogany.

LONDON.

The *Timber Trades Journal* of March 10, says:—The proportions of American deals (pine) are much the same as when we last made the comparison a month ago, and are still short of those of February twelvemonth by 154,816 pieces. There were some heavy pine sales in the early months of last year, and the trade in this description was altogether brisker, so that we must attribute the slow movement in relation to the dock stocks of this description to the general dulness now prevailing; in last Wednesday's sale there was only a few lots of deals of this description, which fell to one buyer at £9 10s., a price that is not at all in harmony with the limited nature of the stocks. We expect, however, the yards are pretty well supplied, a great deal of the past season's import having gone direct to the purchaser without troubling the dock company to land it. The stock of spruce deals still continues behind that of last year at similar date, and though from some of the lower ports we may look for an arrival or two towards the end of next month, yet with the prospect of a cold spring, it may be much later before any additions to the present supply are received here. As far as regards the state of the stocks on this side generally, both Baltic and Colonial, their present proportions offer certainly no obstacles to an advance in values; indeed, the fact of there being not more than an average quantity will, at the slightest indications of activity in the wood market, help values up rapidly. The duty that has been taken of Canadian wood produce by the United States Government, amounting to something like 4s. a standard, will give a fillip to prices of pine goods, though whether it will be appreciably felt over here is difficult to say. We expect a great deal of timber in the lake districts has found its way to the United States for many a long day, and in this way the difference to the Canadian production by the reduction of the duty, which we apprehend was never a prohibitory tariff, will pass unheeded.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal*, writing on March 10th, says:—The same cry of want of business, which has been heard so long, is still perplexing the sawmill owners and timber exporters of the North of Sweden, and the latter have at length taken a step which should have been adopted three months ago; to wit, *measures having for their object a reduction in the present winter's output of logs.* As your readers will have observed from my last week's telegram, producers between Gefle and Sundswall have agreed to restrict their get of logs by about 25 per cent., and it is also understood that a few of the most extensive and influental firms north thereof will likewise adopt a similar measure. Although the step taken has a suspicious resemblance to that of the worthy who locked his stable after his horses had been stolen, still it will have a beneficial, if somewhat prospective, influence. Producers now see that some such restrictive measure is so obviously in their own interests, that I have no doubt the agreement will be generally kept, and that a fair reduction in the "get" will be the result. Should this be the case, the market will probably soon recover its vigour, seeing that the heavy stock of sawn wood on hand in Sweden is counterbalanced by a decidedly smaller stock of logs in the waterways than usual. It is this circumstance, and the strong financial position of the trade as a whole, that offer such a barrier to further reductions in price.

Subscribe for the CANADA LUMBERMAN.

SAGINAW RIVER.

EAST SAGINAW, Mich., March 20.—There is plenty of snow in the woods and hauling is good, although many operators have got in all they calculated on and are coming out. A heavy storm prevailed on Sunday and several inches of snow fell. The weather has been cold and wintry the past three days. Charles Floyd, who has taken the contract to drive the logs on Rifle river, says the product will approximate 140,000,000, against 115,872,000 for 1882, rafted out, and 6,213,000 feet in the booms at the close. The product of the Chippewa and its tributaries is estimated as follows :—

	Feet.
Main Chippewa	28,900,000
South Branch	27,000,000
North Branch	9,000,000
Coldwater	35,000,000
Total	99,000,000

A. Micho, who is lumbering on sections 10 and 11 of town 26—8, and banking on Pine river, has in over 2,600,000 feet of logs. He will put in a cut of 3,000,000 feet. David Mulvena has put 4,300,000 into Brush Lake, near Alpena. C. Wilson is putting into Pine river 3,000,000 feet. John C. Brown will complete his operations about April 1. He operates 11 camps and his cut will approximate 30,000,000. The estimate for Bluff creek is 6,500,000.—*Northwestern Lumberman.*

Logs in Abundance.

The Chicago *Northwestern Lumberman* says: The result of the present logging season should forever silence the men who every season prophesy that the logs put in will not meet the demand of the mills. The present season has been very unfavorable, and it is doubtful if the loggers have ever worked to greater disadvantage. The weather has been severe, the earth soft and the snow deep. It has been a telling winter on both men and teams. Last winter was a very bad one, but the cost of putting in stock this winter has exceeded that of last But, notwithstanding the various drawbacks, there will be logs in abundance, although the intended cut in some cases will not be secured. As long as the operators, backed by amply capital, make a business during the winter months of banking logs, no weather that has ever been experienced yet will beat them.

Good Sawing.

A gentleman, writing from Tennessee, says it it not the ambition of the firm of which he is a member to see how great an amount of lumber it can turn out, but it will aim to saw all the good lumber possible out af a log, and call culls culls. He thinks he can make more money by doing good sawing, and less of it in a day, than by running as many logs through as possible, and calling the entire output marketable lumber. If all mill men were to adopt this as their platform, few of them would be obliged to submit to a knock-off in prices when their lumber was marketed, because it was poorly manufactured and graded.—*Northwestern Lumberman.*

THE *Northwestern Lumberman* says :—There are indication on a majority of the streams that a break-up is near at hand. On a few of the rivers work is already suspended, and the operators are ready for the spring drive. In several districts there is plenty of snow, and work will be kept up until warm weather calls a halt. Many figures are floating around, pretending to give the cut of the different section, but outside of two streams—one of them a small one—all such figures are guesswork.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle,

CLYDE PRICES.

The *Timber Trades Journal* says :—A sale of American timber and deals was held at Greenock, on 22nd of February, as under noted, when a large company assembled and bought freely. From the prices recorded the brokers have apparently made a slight concession as to price on some portions of the goods exposed.

Successful Season.

The last of McDonald Bros.' men returned from their lumbering shanty in the first concession of Dummer, at the head of Clear Lake, on Saturday. They had a most successful season, and took out more logs than they did last year. The only drawback was the loss of of two horses, both of which died in the same week, one dropping dead in the harness and the other dying after being sick a day and a half. The firm has lost in the shanties eleven horses inside of nine years, which is no slight loss.

Winnipeg.

The *Commercial* of March 20, says :—Prices remain at old quotations, viz.: Sheeting, $28; common dimensions, $30 to $31; fencing, $28 to $34; stock, $33 to $40; flooring, $35 to $48; graded clear, $50 to $70; shingles, $4.50 to $6; laths, $5.

THE *International* of Emerson, Manitoba, says :—Our lumber dealers are shipping large quantities of lumber to points west on the C. P. R., principally Manitoba City, Moose Jaw and Regina.

THE *Northwestern Lumberman* says :—During January, 11 lumber vessels sailed from Puget Sound for the ports of Melburne, Valparaiso, Honolula, Callao, Salina Cruz, Townsville, Australia, Shanghai, Sydney and Guayamas. They were loaded at Port Gamble, Utsalady, Port Blakely and Seabeck, with cargoes comprising 5,396,889 feet of rough lumber, 374,575 laths, 513,155 feet of surfaced lumber, 62,900 pickets and 200 piles, the aggregate valuation of which was $82,443.75. The list of vessels arriving from foreign ports, and arriving coastwise to sail foreign, comprises 13, of which nine are American, two British, one French and one Chilian.

Russia	6,540	16,395
Sweden and Norway	42,449	107,634
British North America	38,062	88,982
Other Countries	13,724	51,831
Total	100,775	264,842
Staves (all sizes)	4,259	28,951
Mahogany (tons)	5,587	50,957
Total of Hewn and Sawn	220,608	600,985

Spruce Export Duties.

The Sherbrooke *Gazette* says :—Among the notices of motion in printed routine of proceeding in the Ottawa Parliament, we observe with pleasure that Mr. Ives, the member for Richmond and Wolfe, has notified the House of his intention to introduce a resolution "declaring it expedient to consider the question of an increase of an export duty on spruce logs exported from the Province of Ontario and Quebec." We have repeatedly spoken of the necessity for restrictive legislation in this matter, as the manner in which our forests are being denuded of their best timber and transported in the log free to the United States, there to give employment to numberless lumber mills and thousands of workmen, is a subject demanding serious attention.

MR. C. WHITNEY and J. White were cutting wood in the woods recently, near Oswego, N.Y., and after felling a tall tree, proceeded to saw it up. While sawing off a log full fifty feet from the butt, the saw struck something, which at the time they called a knot, but the condition of the saw indicated that it had passed through harder than stovewood, and upon examination they found a stone the size of a butter nut firmly imbedded in the tree, and which was sawed completely through the centre. The tree was sound and the stone so firmly fixed that they had to dig it out with a knife.

THE Orillia *Packet* says :—Messrs. Tutton & Trill, of the Orillia foundry, shipped on Wednesdey a 75-horse power engine to Thompson & Baker, Gravenhurst. They have sent them a large lot of heavy machinery during the winter, and have more to ship as Messrs. Thompson & Baker are re-building their mill. Messrs. Tutton & Trill have nearly completed a 70-horse power massive engine, for the large tug Huron on the Georgian Bay, for the American Lumber Company. They shipped last week to the British American Lumber Company, Midland, about 12,000 lbs of castings for mill machinery and large burner. They have now in hand the repair work for seven saw mills, and orders for two more large engines, which they are just commenciug.

Davy & Clark, druggists, Renfrew, date of June 3rd, write :—"Burdock Blood Bitters, though comparatively a new preparation, has taken the lead in this locality as a blood purifier, our sales of it being equal to that of all other medicines used for the purpose during the last year."

A ROPE ABOUT OUR NECKS.—A weak stomach or enfeebled circulation is like a rope about our necks. We are strung up and unstrung alternately till existence becomes unbearable. Burdock Blood Bitters will arrest all this misery. Burdock Blood Bitters is a boon to the sick. Let us remember this fact.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w46d112L22

THE EAGLE TREES.

Great pines that watch the river go
Down to the sea all night, all day,
Firm-rooted near its ebb and flow,
Bowing their heads to winds at play,
Strong-limbed and proud, they silent stand,
And watch the mountains far away,
And watch the miles of farming land,
And hear the church bell tolling slow.

They see the men in distant fields
Follow the furrows of the plough;
They count the loads the harvest yields,
And fight the storms with every bough,
Beating the wild winds back again.
The April sunshine cheers them now;
They eager drink the warm spring rain,
Nor dread the spear the lightning wields.

High in the branches clings the nest
The great birds build from year to year;
And though they fly from east to west,
Some instinct keeps this eyrie dear
To their fierce hearts; and now their eyes
Glare down at me with rage and fear;
They stare at me with wild surprise,
Where high in air they strong-winged rest.

Companionship of birds and trees!
The years have proved their friendship strong;
You share each other's memories,
The river's secret and its song,
And legends of the country side;
The eagles take their journeys long,
The great trees wait in noble pride
For messages from hills and seas.

I hear a story that you tell
In idleness of summer days;
A singer that the world knows well
To you again in boyhood strays;
Within the stillness of your shade
He rests where flickering sunlight play,
And sees the nests the eagles made,
And wonders at the distant bell.

His keen eyes watch the forest growth,
The rabbit's fear, the thrushes' flight;
He loiters gladly, nothing loath
To be alone at fall of night.
The woodland things around them taught
Their secrets in the evening light,
Whispering some wisdom to his thought
Known to the pines and eagles both.

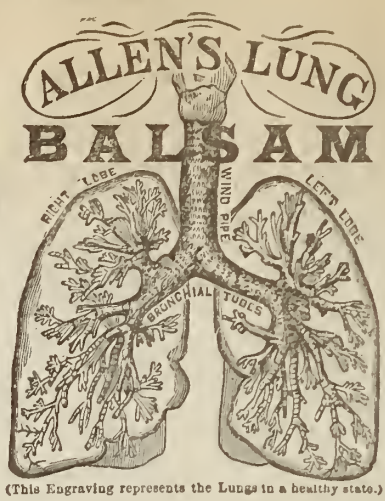
Was it the birds who early told
The dreaming boy that he would win
A poet's crown instead of gold?
That he would fight a nation's sin?—
On eagle wings of song would gain
A place that few might enter in,
And keep his life without a stain
Through many years, yet not grow old?

And he shall be what few men are,
Said all the pine trees, whispering low;
His thought shall find an unseen star;
He shall our treasured legends know;
His words will give the way-worn rest
Like this cool shade our branches throw;
He, lifted like our loftiest crest,
Shall watch his country near and far.

—*Sarah Orne Jewett, in Harper's Magazine.*

DUTY ON SPRUCE LOGS.

Mr. Ives moved in the Canadian House of Commons, on Wednesday, March 14th, a resolution declaring it expedient to consider the question of an increase of export duty on spruce logs exported from the Provinces of Ontario and Quebec, and pointed out that there was nothing new in the principle of the motion, for it was in persuance of the settled policy of the Government. The present duty of $1 per thousand was not sufficient to prevent export of logs to be sawn in the United States. He knew of one case where Canadians had gone across the lines and built mills in the States in order to saw Canadian logs. Slabs and other refuse of these logs were used as pulp wood on which there was no export duty. In some cases he knew logs to have been sawn up into boards, thus escaping export duty on logs. He advocated an export duty on pulp wood to meet this difficulty and as protection to Canadian pulp manufacturers. Mr. Benson advocated extending the law to all saw-logs, otherwise lumber manufacturers would be driven from the Province. Sir Leonard Tilley promised to consider the matter, but pointed out that to change the law without warning would cause loss to those who had entered into contracts. Mr. Charlton strongly objected to the tax. The Americans imposed a duty of $2 upon lumber, whereas we imposed a higher duty, and they charged no export duty. This class of legislation was calculated to provoke retaliation, so that there might be an export tax imposed on logs from the State of Maine into New Brunswick. The effect of increasing the duty would be to reduce the price to the farmer for the benefit of the saw-mill man, which he thought a poor application of the motto "Canada for Canadians." He went on to speak of the general export duty on logs, holding that its principal result was to enable Michigan saw-mill men to import logs from Georgian Bay instead of their being floated down to Toledo or Cleveland. If there was so much done in the way of sending logs across the lines from Canada as was asserted, it must have been done by evasion of the export duty. Last year the export duty on this article was $8,000, which would give about 8,000,000 feet, or enough to supply a mill for about three months. He asked what would be thought of a proposition to put a duty of 20 per cent. on wheat, because flour was manufactured in the United States. An increase of duty would in his belief only lead to an increase of friction between Canada and the United States, and make it more probable that retaliation against Canada would result. Mr. Mitchell followed, expressing pleasure that this proposed increase was only to affect Ontario and Quebec, as among his constituents was a considerable export of spruce spars, which he would be sorry to interfere with. He condemned the increase in any case as tending to harm limit holders in Ontario, while conferring only a doubtful benefit on a few people in the Eastern Townships. He called on the Finance Minister to come to the rescue of the lumberman by reducing the duties of cornmeal and other mill supplies. The men had supported the National Policy, and so did he (Mitchell), and would still, but that very thing he thought should be a recommendation to the consideration of the Government. Mr. Cook spoke against the duty, endorsing what Mr. Charlton had said regarding the export of logs to Michigan. Mr. Ives, in reply to Mr. Charleton, had used the expression "speculators" as applied to the holders of limits in Western Ontario. Mr. Cook said he thought they were, on the contrary, *bona fide* representatives of a *bona fide* interest. He admitted that limit holders in the North West might be called speculators, for he understood that the limits had been secured by doctors, lawyers, and ministers, who could not be expected to work them. He asked what Mr. Benson would think if an export duty were imposed on corn by us so as to prevent his manufacturing it, and he asked what would be the result to Manitoba saw-mill men of the United States put an export duty on logs floated down the the Red River from Manitoba. Would the Minister of Custom, Mr. Bowell, representing North Hastings, allow an export duty to be put on iron ore going to the United States? In case an attempt might be made to weaken the force of what he said by showing that he was engaged in the trade of exporting, he stated that he dealt in manufactured lumber only, but he knew of farmers having timber on their farms useful only to be cut into long logs and shipped to the United States, and the effect of the duty was to decrease the price they received for such timber. Mr. Valin was in favor of increasing the export duty on logs, because, owing to the price of lumber in New York and other American cities, large quantities of Canadian lumber were sent to American markets. This caused the destruction of Canadian forests, and timber was now scarce where formerly it was plenty. He also advocated an export duty on hemlock bark, as such large quantities of it were sent to the United States that the supply was now giving out in many districts. Mr. Sproule said that the duty would not bear hard on the farmers, but on speculators who monopolized the timber trade of Georgian Bay and and other regions. Mr. Bourbeau spoke in favor of the export duty in French. Mr. Scriver said that the mover was mistaken when he asserted that the tax would affect a few owners of large timber limits alone, and would not be felt by farmers in the district which both he and Mr. Ives represented. Owing to the scarcity of the water power and the fewness of saw mills farmers were obliged to take the timber across the border to be sawed and had to pay the present duty on them, and if an export duty were licensed they would be the principal sufferers. The tax was intended to take money out of the pockets of a few large mill-owners. He (Mr. Scriver) was convinced that the motion was made in the interest of the mill-owners of the Eastern Provinces. At the instance of Mr. Tilley, Mr. Ives withdrew his motion.—*Globe.*



(This Engraving represents the Lungs in a healthy state.)

THE WAY IT WILL AFFECT YOU.

It excites expectoration and causes the lungs to throw off the phlegm or mucous; *changes the secretions and purifies the blood;* heals the irritated parts; gives strength to the digestive organs; brings the liver to its proper action, and imparts strength to the whole system. SUCH IS THE IMMEDIATE AND SATISFACTORY EFFECT that *it is warranted to break up the most distressing cough in a few hours time,* if not of too long standing. *It is warranted* TO GIVE ENTIRE SATISFACTION, EVEN IN THE *most confirmed cases of Consumption! It is warranted not* to produce costiveness (which is the case with most remedies), or affect the head, as it contains no opium in any form. *It is warranted to be perfectly harmless* to the most delicate child, although it is an active and powerful remedy for restoring the system. *There is no real necessity for so many deaths by Consumption,* when ALLEN'S LUNG BALSAM will prevent it if only taken in time. Physicians having consumptive patients, and who, having failed to cure them with their own medicine, we would recommend to give ALLEN'S LUNG BALSAM a trial. *Sold by all Druggists.*

PERRY DAVIS'
VEGETABLE
PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

THE SWEDISH SUPPLY REDUCED.

The London *Timber Trades Journal* says:—It is is stated that the Gefle, Ljusne, Marma, and Iggesund companies, together with several of the large Sundswall saw mills, by last advices have agreee to reduce the present season's log driving and proposed cutting 25 to 30 per cent., rather than to sell their goods for no profit, which they consider would be a waste of time, and, to use their own words, "neither make their financial position better no worse." Some of the mills at Gefle have already, we understand, decreased their cutting in the forests to the extent mentioned, this having been determined upon prior to the general understanding recently arrived at. Furthermore, it is said, the weather in a great measure, has already assisted in decreasing the log driving of those mill proprietors who have not yet pledged themselves to any agreement in respect to this limitation.

REVERSING POSTS.

It is firmly believed by many people that posts set in the ground in a position the reverse of which they stood while growing in the tree, will last much longer than when set top end up. In the spring of 1879 I selected seasoned sticks, three feet long. These were split in two, and and then cut in two crosswise, making four pieces each. One set was placed in well drained sand, the other in clay soil. In every case two pieces were set side by side, with earth between, one as it stood in the tree, the other reversed. I tried thirteen kinds of timber. Some of these were young wood with the bark on. All contained some heart wood. Those set in sand were examined in the autumn of 1881. In case of the beech, sugar maple, ironwood, black ash, and black cherry, the piece reversed or placed top end down was somewhat most decayed. In case of red maple, American elm, butternut and red elm, the piece set bottom end down was a trifle the most decayed. In case of basswood white ash, white oak, and blue ash there was no preceptible difference. In the autumn of 1882, the posts set in clay soil were examined. In case of red maple, sugar maple, American elm, basswood, butternut, red elm, the piece set top end down was most decayed. In case of beech, white ash, black cherry, the piece set bottom end down was most decayed. In case of ironwood, white oak and blue ash, there was no perceptible difference.

I infer that where one piece decayed more than the other it was caused by some trifling difference in the sticks. The freshly sawed ends in each case were placed uppermost, and came an inch or two above the ground.

In some cases one half of a stick (one piece certainly the reverse of the other) lasted considerably better than its other half. As will be seen, it was sometimes the top end down which lasted better, sometimes the bottom end down, and in some cases there was no difference in durability.—*W. J. Beal.*

White v. Red Spars.

The following letter appears in the *Timber Trades Journal*:—

SIR,—There has been some controversy raised recently as to the comparative merits of white and redwood spars, some people maintaining that whitewood spars, for ship use, are the best, while others assert that the question is ridiculous, and that no one would use white spars who could get red ones. But these latter parties are met by the fact, as I am informed, that the Admiralty use only white spars, which appears to be a very strong argument in their favor; on the other hand, it is understood that redwood spars are decidedly preferred in the merchant service. Perhaps you, Sir, or some of your experienced readers, will let a little daylight into this subject for the instruction of your very obedient servant,

A SELLER.

Chatham, 28th February, 1883.

The Stylograph Pen.

The stylographic pen is one of the necessaries of our modern civilization. If Hood's song had been "Dip, dip, dip," instead of "Stitch, stich," it would have lost its text at the hands of Mr. Livermore, who has given his age this perfection of pen, penholder and case, and ink, all in one, handsome, and always at hand and ready for use. The inventor has put some new improvements into it, and now what remains but for every scribe and letter writer to find it on his desk. Ink, filler, and cleaner, all go with it. And to crown all the price has been reduced to $2. Send that amount to the sole agent, Mr. Louis E. Dunlop, 200 Washington St., Boston, Mass., and the return mail will bring you this most perfect pen.—*Contributor, Boston, Mass.*

HART EMERY WHEEL COMPANY, Limited

DESERONTO,
Lumber Merchants.

THE WINNIPEG LUMBER TENDERS.

The method adopted by the city in making contracts is rather peculiar. Some time ago they advertised for tenders for 1,500,000 feet of lumber for city purposes. The tenders were opened in due time and the council at the first meeting thereafter awarded the contract to the lowest at $24.66. The winning tenderers are new comers to the city. Local pressure was brought to bear upon the council and the august body met again, rescinded their former resolution and awarded the contract to the next highest. Such a mode of dealing with tenders is certainly not according to the ordinary rules of doing business. The whole object professedly arrived at in inviting tenders was to obtain the lumber at the lowest figures. The tenderers presented their offers in perfect good faith believing that whoever was the lowest he would be sure to get it no matter who it might be. The lowest tender was accepted in the first place, then after all the figures are made public one firm thinks fit to amend his tender so as to bring it below the one which had been successful. The council allows this to be done, and the party who should have got it, and did get it in the first place, is left out in the cold. Further comment is unnecessary.—*Winnipeg Commercial.*

A CANADIAN ELECTRICAL FACTORY.

Electricity is no longer a subject of unmixed wonder and amazement. Science has revealed it as a servant to man, capable of doing him service in a thousand ways. Probably its application to the wants and comforts of humanity is but in the very infancy of discovery. There is a vastness in electricity as boundless as space itself, and there can be no limit to its usefulness. As a purifier of the atmosphere it is without rival in nature; as a medium by which intelligence may fly through space it has no equal, and it bids fair to substitute candles, lamps, and gas by its more pervading light-giving power Even heat and motive power may yet find its highest perfection in electricity. But none of the modern applications of this marvelous force are more valuable to humanity than those which are directed against personal suffering, and "the ills which flesh are heir to." As a curative or remedial agent, electricity bids fair to rank amongst the very highest and best of the vast resources and unlimited varieties of nature. To apply electricity in a practical way, so as to bring it into actual contact with the many weaknesses and complaints of physical life is a great study, and one which we venture to say has but just begun to develop. It will be interesting indeed to Canadians to know that one of the most direct applications of the electric fluid to the human body has given birth and growth to an industry. We recently visited the establishment of Mr. A. Norman, of No. 4. Queen street east, Toronto, and were surprised to find it quite a factory for the production of great varieties of appliances for conveying electricity to the various parts of the human body.

Mr. Norman is a practical thinker, and endeavors to work out the problem of the application of nature's forces by numerous agencies simple in themselves, but capable of accomplishing the desired end in proportion to the degree of mechanical perfection in which they are made.

The manufacture of electric appliances was commenced in Toronto by Mr. Norman seven years ago. He then started to make insoles for the feet, and charging them with electricity so as to apply to the extremities. Very speedily his business developed into the manufacture of belts for the back and chest, waist, head, and indeed all parts of the body, so as to bring the application of the vital fluid to the parts affected.

In the manufacture of these various appliances, Mr. Norman has provided himself with the newest and and best machines, so as to turn out the work efficiently and to make them comfortable as well as effective to the wearer. Here are the cutting benches with numerous presses and suitable shears—a large dieing press with a variety of dies of various shapes to stamp out the metal as required, machines also for cutting metal to the sizes, sewing machines for stitching the materials together, &c. Here are coils of many pounds weight of copper, of zinc and other metals and numerous smaller matters which did not escape our notice, but would weary our readers to detail them. The electric battery which Mr. Norman uses is believed to be the largest in use for this kind of purpose in Toronto.

"What metals do you find to be the best conductors of electricity"? we asked.

"I use zinc and copper—zinc and silver—zinc and gold—zinc and platinum—the latter combination is decidedly the best, and is also the dearest," was the reply.

"And do you make many of these various kinds of belts?" "We are never idle," was the reply, "our business is constantly on the increase and orders come from far and near. There—pointing to a goodly pile—is a shipment for the States."

"So you export them, do you?" was our next enquiry. "Oh yes, we ship great numbers to the States, as they cannot get our kind of belt except through us."

"What is the best article you make as a belt for general use."

"THE ACME," said Mr. Norman, "is my own invention. I have travelled much through the States and elsewhere, and have been an observer always, and I conscientiously believe the "Acme" to possess all the advantages of every bolt yet made, without any of the drawbacks of others."

The one thing which surprised us most, perhaps, was the great variety of these belts, and the large stock—carefully arranged in sizes—which Mr. Norman finds it necessary to carry in order to keep pace with the demands of his business. As to the practical value of all these appliances, we can only say that Mr. Norman possesses abundant testimonies to their worth, and furnishes more than sufficient proof of the genuineness of these testimonials. How they affect this end can best be learned from Mr. Norman, who will gladly send circulars, pamphlets and all particulars on application to his address at 4 Queen street East, Toronto.

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and Account Books of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

Books taken out in parts, Bibles, Works of Art, Illustrated Works, Music Books, Magazines, Perodicals and Newspapers bound in any style desired.

Old Books, Albums, &c. Repaired and Rebound.

Maps, Pictures, &c. Mounted and Varnished.

Names Lettered in Gold Leaf on Presentation Books, Bibles, Purses, &c.

THREE FIRST PRIZES FOR BOOK-BINDING AT THE CENTRAL EXHIBITION.

THE NORTH-WEST TRADE.

The Winnipeg *Commercial* says:—The vast quantities of logs and timber that are being taken out during the present season in the Lake of the Woods and Lake Winnipeg districts, and which will be manufactured into lumber in the spring, points to a supply of the home product far in excess of what has yet been known. Enterprising capitalists, many of them at the same time practical men, have gone into the business of supplying lumber from our own forests in earnest. There seems to be little danger this year of the dearth of building material in this line which occurred last season. There may perhaps be somewhat of a scarcity for a while early in the season, but so soon as the mills get fairly running the supply will be equal to all demands. Besides the local product there will also in all probability be a considerable supply from outside.

This must according to the usual course of events, result in a more reasonable rate being charged for lumber. The city has already made a contract for a million and a half feet at a price considerably below that of last year. Private parties cannot but reap a corresponding benefit. Even at a figure below that of last year the manufacturers will have a good margin of profit left. Of course the demand from the rising towns outside and from the farmers in the country will be largely in excess of any previous year, but the supply in sight is correspondingly increased.

The whole country will reap a benefit by the large supply. Last year the great drawback to building operations in many cases was the inadequate supply, but it does not seem as if this would occur again. In the United States there has also been a slight fall in prices. At a recent meeting of the Lumberman's Exchange in St. Paul, reductions were made in all descriptions of timber and lumber, so that if it does happen that we have to fall back upon the yards across the line for some of our supplies that could be provided at a figure under that of last year. So that on the whole the prospect of cheaper lumber this year is good all around.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

TOKER & Co.,

"THE CANADA LUMBERMAN,"

PETERBOROUGH, ONTARIO.

EMERY WHEELS FOR SAW GUMMING.

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

THE RING-RECORD OF TREES.

Dr. A. L. Child's statement that "trees known to be only twelve years old were found when cut to have thirty-five or forty of the rings which are popularly believed to be annual marks," naturally suggests the idea that rings thus found are no indication of the age of a tree; are mere haphazzard, signifying nothing of importance. It has long been a custom in this country among land surveyors, when running lines through forests, to mark their lines by blazzing all trees which come in the line of sight; as well as those very close to the line. And in place of planting monuments at corners, as the custom is now getting to be, trees were marked as witnesses to corners, as they are known to all surveyors. In surveys made under the direction of the Government, these trees were particularly designated—kind of wood, diameter, course and distance from the corner. Hundreds of times in the past twenty years I have had occasion to chop in these trees to satisfy myself in regard to their identity. In every instance the nrmber of rings corresponds to the number of years since the survey was made. I believe that our forest trees made but one ring each year. The surveyor has an excellent opportunity thus to study the growth of forest trees. It is in this way that we are enabled to trace back the history of a survey; and we can tell to a certainty when new witness trees were made to perpetuate old corners and by whom made.

The truthfulness of this "ring-record" is of great importance to the surveyor. I have no donbt that Dr. Child found these rings, or what to him appears like annual rings; but were they not shaded rings rather than distinct marks, as we may find in some of our fruit trees, especially those brought from a different climate? This shading of rings, I believe, may, in many instances, be due to a premature ripening of the wood, caused by drought or other influences, and afterward from copious rains and high temperature are forced to make a second growth, and in some instance to blossom and set fruit late in autumn. An examination made upon trees of my own planting, both dcciduous and evergreen, proves the annual rings to be true to date every time.

FACTS ABOUT BUTTER TUBS.

Vermont is the great butter tub state of the union, and Montgomery is the town yearly producing the largest number of tubs in this country, or any other for that matter. The fact ories in this town have capacity for producing half a million tubs or packages as the trade call them. They are not all used for butter. A great number are bought by lard packers and the olemargarine manufacturers have within two or three years increased the demand greatly.

Up to 1847 the tubs were made slowly and laboriously by hand. In that year Luther Hendrix, an experienced pail maker of Massachusetts, commenced the manufacture of machine made or turned tubs in Montgomery in a factory built for the purpose. It was then considered a good day's work for one man to turn from 40 to 50 50-pound tubs per day, while now the improvements in machinery and skill acquired by the workmen make it an easy day's work for four men to turn 300 50-pound packages per day. The other work, the hooping, the heading and making the covers, is performed with one-half the labor that was required at that time. It is probably within the bounds of truth to say that 10 men in any of the factories in this town would now manufacture more packages in a given time than 50 men would manufacture in the same time by hand.

The business grew slowly until 1852, when a new impetus seemed to be given the dairy interests. The completion of railroads to the west opened a new and larger outlet, and the small weekly shipments from Montgomery and other Vermont towns in this industry has increased to daily shipments of carloads.

The consumption of lumber by these factories is very large and mostly of spruce, which gives better satisfaction than any other kind of wood. The supply is large. but by no means inexhaustible, and very soon if spruce alone is used it will have to be obtained further back on the hills than now even. It is suggested by a manufacturer of long experience that hemlock, if of the right sort, grown in dry locations may be used without objection. It is quite possible that wood pulp will be successfully used for making butter tubs, and this supply, together with that of hermetically sealed tin packages, now used for ocean shipment to some extent, will be likely to lesson the demand on the forests. —*Boston Bulletin.*

WOOD PULP.

Wood pulp, which is made into paper and molded into barrels, casks, pails, and other wooden ware, boxes, cornices, picture frames, and a variety of small articles, can now be made from many other woods than poplar, which has long held the preference in such manufacture, Buckeye has a white fibre, and can be used, while spruce, pine, chestnut, basswood, fir, hemlock, cedar, cottonwood and other kinds of wood have been found suitable for making into various kinds of paper. Only the non-resinous woods are adaptable for white paper, while the resinous woods serve well for colored paper. Machines have been built which turn out pulp with equal facility from all kinds of wood, however. The longest fibre is made from willow, basswood and poplar ranking next, respectively, in that regard. Cedar, fir and hemlock are said to grind about alike, the latter working a little more freely. Maple has a fibre shorter than either spruce or pine, and is quite hard to grind; birch is comparatively hard, and grinds very short; poplar and buckeye pulp remain white for a considerable time, other woods changing color; birch becomes pink, maple turns purple and basswood takes on a reddish hue. It is estimated that over 200 tons of wood pulp are daily turned out in the United States.—*Lumber World.*

BRITISH COLUMBIA.

Logging methods are rather devoid of improvement in the British Columbia lumber districts. Logs are generally snaked, from two or three to seven or eight yoke of oxen being employed as a team. A good ox-teamster commands the highest wages paid, and is the biggest man on the job. A few mules are used, and one camp has a brace of old-style Scotch traction engines at work on the main road. A New Brunswick man bought them at a cheap price after they had been found to be unsuited for use on a waggon road, on account of the numerous hills. They are credited with doing surprising service on a level and well kept road, and have the advantage of requiring no sustenance while kept idle. What one of them will ordinarily haul can be understood by the fact that it dragged a log 24 feet long and 48 inches in diameter at the small end, with another dogged to it at the top that was 60 feet long and 24 inches in diameter at the small end. Another camp has a wooden tramway.

Logs have not yet been cut more than a mile or two from deep water, and no driving in the small streams has been done, or apparently thought of. There are numerous suitable streams in the timber regions, but they would require much costly improvement to suit them to floating the heavy timber. No system of collecting crown dues on stumpage is there in operation, as in other parts of the Dominion, and nothing is done by the local government to assist the lumbermen in the matter of making improvements. Anybody can enter government land, having perfect freedom to cut timber anywhere. Government land and the timber on it can only be secured by purchase. The camps are well arranged, and the tables excellently supplied. Every man furnishes his own bedding.

In felling the giant Douglas fir, chopping boards are employed, six or seven feet long, and six or eight inches wide, shod with iron at one end, the same as are used in the red wood regions, which are driven into notches cut at the proper height. On these the choppers stand. They are sometimes placed 10 feet from the ground, to avoid shakes, as the logs are not butted after felling, and for the reason that the fir trees are much harder near the ground than a little higher up.

The wages of choppers and teamsters run from $50 to $75 per month, and those of sawyers and road cutters from $25 to $40. The amount realized by the men is more or less reduced by the time lost during unfavorable weather, when their board is charged against them.

The mills are somewhat different from those in the eastern part of Canada. The logs are canted and rolled by machinery, dogs not being feasible. All the appliances have greater weight and strength than is required for pine. The square timber is sawed, and none hewed. The edger tables travel backward and forward, and the trimming saws are swinging ones. Every mill has a planer in connection, which dresses the green lumber, as it comes direct from the saw.

The export trade is heavy in spars, for which the timber is particularly suitable, on account of length, strength, straightness and elasticity, and the exporting has been chiefly confined to the two mills of Burrard Inlet, owned by the Moodie Saw-Mill Company, and the Hastings Saw-Mill Company. Cargoes are sent to China, Australia, India, Sandwich Islands, South America and Great Britian. The American duty on manufactured lumber has prevented the British Columbian interests from competing very extensively with their Puget Sound rivals. The timber at a little distance back from the coast is the best, but the advent of logging roads will increase the expense.

The common men employed in the mills get from $30 to $40 per month and board, and the more expert from $35 to $50. Sawyers and engineers get from $50 to $75. The two Burrard Inlet mills, the largest in the province, cut 15,000,000 feet each in 1882.

Indications as to the quality of trees are radically different in the fir from those of pine and an expert in the latter finds himself off his reckoning with the former. Lumps that would show the presence of knots in a pine tree may mean no inferiority in a fir, which, however, may also be full of knots without exterior evidence of it. Large quantities of the Douglas fir cover the mountain sides, while good red cedar for shingles and fencing is found along the river bottoms back from the shore line. Farther north the pine disappears, to be replaced by white spruce aud white cedar, and above the parallel of 52 degrees latitude the pine almost completely disappears, and the spruce is abundant. The latter grows very large, aud generally straight and without knots, making tough light lumber for building purposes, which works well under the plane. The white cedar abounds above the parallel of 54 degrees, also a splendid wood, tough, close in grain, and readily worked. It is asserted that it is proof against the boring teredo, which renders it useful timber for wharf piles. It is much favored for shipbuilding, and is said to endure equal to the best oak. Hemlock abounds everywhere, but is chiefly esteemed for its bark. The arbutus grows on the south end of Vancouver's Island, and on the islands in the Gulf of Georgia. There has been severe weather in the province this winter.—*Northwestern Lumberman.*

A GOOD FOREST LAW.

"I never remember a session in which we worked so hard and did so little," said Mr. Jolly. It would be well to give credit and do justice to two really valuable measures which were carried. We allude to two bills of Mr. Lynch's, one to guard against forest fires, and the other, far the more important, to divide the forest domain into settlements and timber lands. The idea, it is true, originated in the useful forestry congress held last year in Montreal, but none the less does the credit of having worked it out and put it into practical shape belong to the Commissioner of Crown Lands. Those who know anything of our Crown Lands can bear testimony to the fact, that the most dangerous man the lumberman has to deal with is the make-believe settler, who establishes himself in the midst of good timber lands, for the purpose of stripping his lot and the surrounding lots of any valuable timber that may be on them, and then, having ruined the property, abandons it. The fact has been stated over and over again, and never questioned, that we know of, that the great majority of the disastrous fires which have desolated miles on miles of choicest timber lands, are due to these people. Mr. Lynch's law promises to put a stop to this kind of settlement, in the future. Nor is there any danger to be fairly apprehended to the colonization interests of the country, from the measure, because it is well known that good pine and spruce land is the worst settlement land that can be found. When the bill was first introduced Mr. Lynch happened to be unavoidably absent, and Mr. Blanchet took charge of the measure. Mr. Flynn attacked it vehemently, in the interests, he said, of colonization. As a rule, Mr. Flynn can give a plausible reason for any side he may choose to take, however wrong he may be. In this case, as ex-Commissioner of Crown Lands, he laid down the law with some authority, resting himself on a number of facts more or less controvertible, and brought to his aid Mr. Picard and a few more country members, who never seem happy except when expatiating on the hardships and defending the interests of the "poor settler." The bill had to be allowed to stand over. Immediately on Mr. Lynch's return, he took the bill up and carried it triumphantly, almost without a dissenting voice. It is needless to say that the Commissioner, in his really eloquent defence of his measure, was vigorously backed up by Mr. Joly, who takes the greatest interest in all that pertains to our woods and forests. The act will prove a substantial benefit to the lumbermen, who will no longer be harassed by the petty pilfering of mock-settlers, and who, moreover, will be freed from the much greater risk of loss through their negligence in making fires under pretence of doing settlement duty and clearing land which every one knows they never intend *bona fide* to settle permanently upon. It will prove a no smaller, or more inconsiderable, boon to the real settler, since it will direct him to land upon which he can hope, by hard work and hard living, ultimately to establish a comfortable home and earn a respectable maintenance. While, if left to himself, he might do as others have done before, establish himself on some of our pine lands, in order to secure employment in winter in the adjoining shanties, and after years of work and hardship and suffering, succeed in clearing his land, only to find that, between the stones and the sand, it virtually is valueless, so much labor thrown away and hard toil lost. It is a pleasure to draw attention to these facts, because we think credit should be given to a really conscientious, hard-working, clear-sighted public officer, and such, we know, is the character with both Conservatives and Liberals, Government supporters and Opposition free-lances, are willing to concede to the Hon. Mr. Lynch.—*Montreal Witness.*

FATE OF A RIVER IN SPAIN.

A correspondent of the *Lumber Trade Journal* says:—A gentleman who appreciated the efforts of Congressman Cox, of New York, to mitigate the inordinate slaughter of our forests, wrote him a letter from which these extracts were taken:—

As I frequently have gone to Spain for some years past, I have had opportunity to observe there the result of devastation of the forests which has continued during the last few hundred years. Let me tell you the condition of a once noble and important river, the Almeria.

About six miles northeast from the city of Almeria is Pechina, once an important town where shipping was carried on. There may yet be seen the wharves and stone buildings that served the purposes of commerce a few hundred years ago.

Now the former river is dry land for six miles, even to the edge of the Mediterranean. What was once a noble, navigable river is now a level sand waste.

In the course of time, as the forest have been cut off and the natural means of retaining the moisture in the mould and alluvial covering of the mountains and hills has been destroyed by the washing down into the river-bed, the mountains have become bare and desolate. The infrequency of rains there has become a matter well known. When they do come, the river bed is a roaring flood, and "straight is dry again." By this the shoal at the mouth of the (once) river is constantly extending into the sea, so that immediately after one of these floods it has been known to have extended half a mile.

Whether this is a part of a divine plan, and so ordered to be, or whether it is a retribution of the Divine Providence upon a country and a people for not husbanding the resources so abundantly provided, may engage the attention of some for the sake of an argument; but to me it is a lesson that we should profit by. What will our vast country become if the forests, furnishing the supply of our rivers, and so graciously withholding and distributing it through the seasons, are to be devastated;

And what country in the world was ever so prodigal of its wood as this? Ties for the supply of 100,000 and odd miles of railway alone is a tax upon the forests of even this great country formidable to think of.

Thus devastated, and the alluvial covering of the hills and mountains of river sources washed down as they are in Spain, we may picture the Hudson, Delaware, Susquehanna, James, Ohio, Missouri, and even the Mississippi mere sand beds; and in future time history may record the navigation of those (once) streams, and be illustrated with pictures of steamers that plied upon their waters in busy commerce "of old."

W. D. M.

DRIVING BELTS.

BY ROBT. GRIMSHAW.

The weight of a horizontal or of a slightly inclined belt connecting horizontal shafts should be sufficient to cause it to sag or belly well down, increasing the arc of contact; but it should not be sufficient to cause excessive pressure on the bearings.

When the horizontal shafts are one above the other, or nearly so, and the belt vertical, or nearly so, the lighter the belt the less it is dropped down from the pulley, and the less the loss of driving power by imperfect contact on the lower pulley. The smaller the lower pulley, and the greater the distance between shaft centres, and the thicker and stiffer the belt is, the more these remarks apply.

Where a belt connects vertical shafts, lightness is very desirable, as a heavy belt in such a position tends to come off both pulleys, unless they are either very crowning or are flanged on their lower edges; in which latter case the lower edges are apt to become frayed or stretched, according to the material,

Horizontal belts between vertical shafts drive better than inclined ever do, and still better than vertical. The reason of this is evident; the weight of a horizontal belt tends to increase not only the arc of contact in both pulleys, but the tension; and the further from the horizontal, the less the driving power.

In this connection it must be borne in mind that where a horizontal belt connects horizontal shafts, the lower fold should be the driver, so as to make the "sag" or "belly" as little of a disadvantage as possible.

New unprepared canvas belts had better be rubbed with hard bar soap before putting them on the pulley. This gives them a smooth, finished surface, improving the grip and pliability. —*Woodworker.*

Barking Hemlock.

The *Courier and Journal* of Potsdam, N. Y., calls attention to the fact that the bark-peelers are making havoc with the hemlock of that part of the State the value of which, for timber and lumber purposes, is becoming more apparent since the spruce is being so heavily drawn upon for supplies. The paper referred to says: "Few people realize how rapidly the hemlock is disappearing from our forests. It is destroyed not only for timber or fuel but almost solely for the sake of its bark. Lumbermen have proposed to attack the hemlock when the spruce shall have been used up, but against the unscrupulous rapacity of the bark peelers and tanneries, hemlock has no show for existence. All through the Adirondacks these trees are fast falling, and their stripped trunks show that the insatiable appetite of the bark mill has been felt even there.

THE correspondent of the *Northwestern Lumberman* at East Saginaw, Michigan, says:—McArthur Bros., a Canadian firm who are operating in this latitude, inform me they have put in 300,000 feet of board pine, 100,000 feet of oak timber, 50,000 pipe staves, and 3,000,000 feet of long and short pine logs.

AMERICAN SAWS:

We represent Four of the Best American Saw Factories

VIZ.

AMERICAN SAW Co.

Emerson, Smith & Co.

R. HOE & Co.

Hubbard, Bakewell & Co.

Inserted Tooth,

BIT TOOTH,

AND

SPECIALLY

THIN

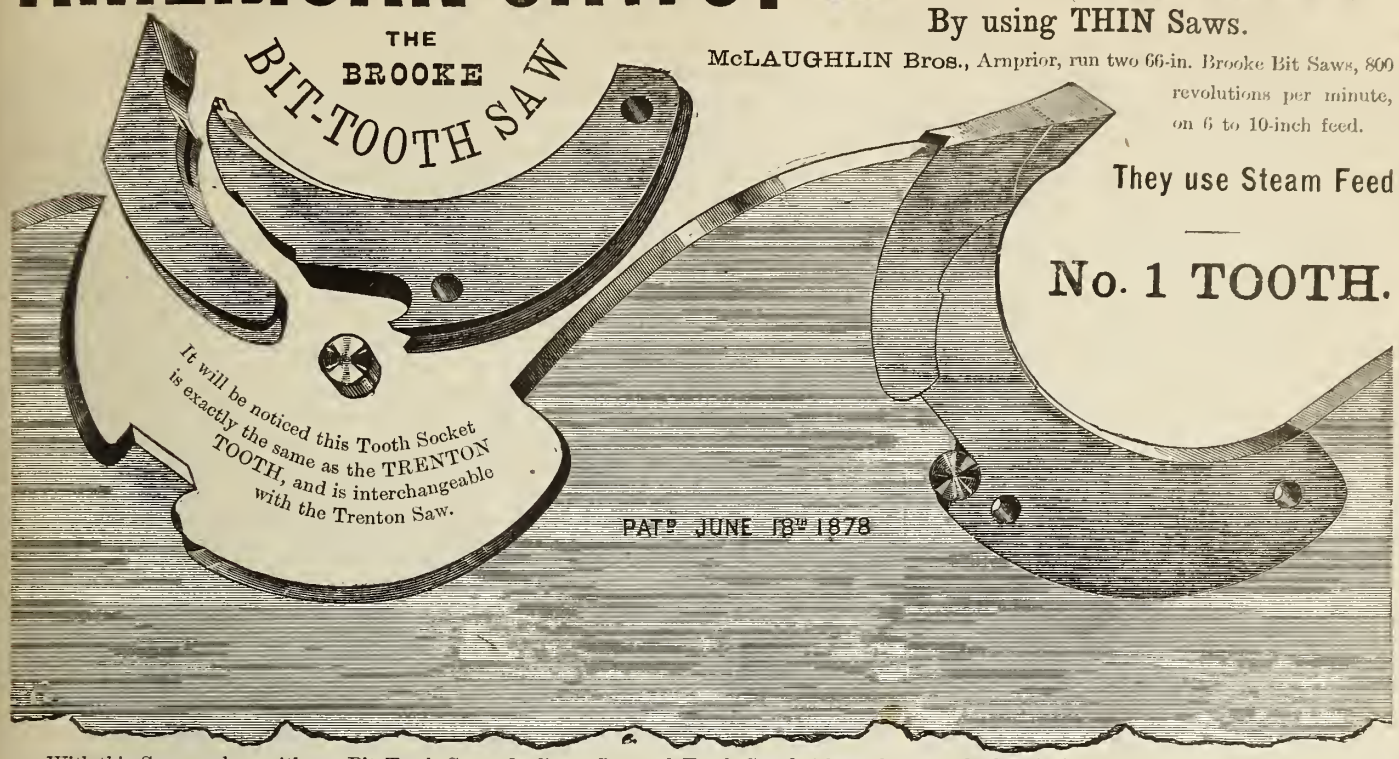
SOLID SAWS

☛SAVE YOUR TIMBER
By using THIN Saws.

McLAUGHLIN Bros., Arnprior, run two 66-in. Brooke Bit Saws, 800 revolutions per minute, on 6 to 10-inch feed.

They use Steam Feed

THE BROOKE BIT-TOOTH SAW



No. 1 TOOTH.

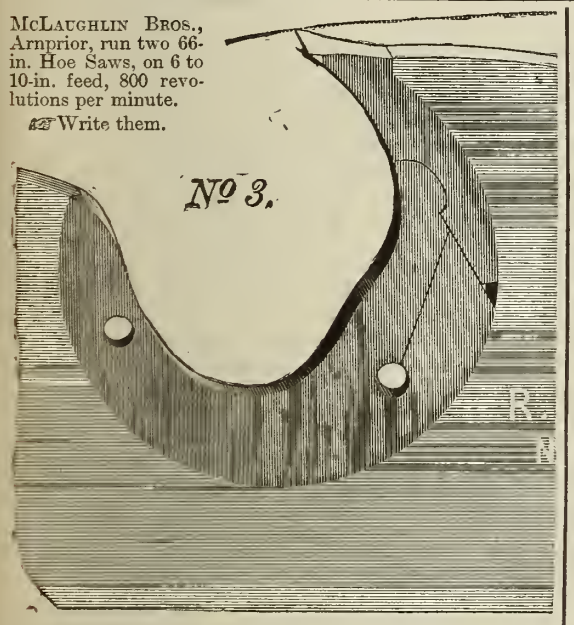
With this Saw you have either a Bit Tooth Saw or ordinary Inserted Tooth Saw, with teeth two-and-a-half inches long, both fit same socket and are interchangeable in a few minutes. These Bits require no gumming, and very little filing; are so firmly held that they will stand all necessary swaging, and can be worn down to dotted line shown in cut; they rest on lugs, saving the strain on the rim of the saw. For these reasons they will cut more and better timber at less cost than any other tooth. EXTRA BITS (per 100) No. 1. $9; No. 2,$8.—(per 1000), No. 1, $80, No. 2, $70.

Two sets No. 1 Bits have cut 500 m. feet pine, in 60-inch saw, running 800 revolutions per minute, on 6-inch feed. E. E. PARSONS, Arnprior.

We run 60-inch to 72-inch Solid Saws, as thin at center as 10 guage at rim—saving, over a 7 guage saw—1000 feet of lumber in every 25,000 cut.

McLAUGHLIN Bros., Arnprior, run two 66-in. Hoe Saws, on 6 to 10-in. feed, 800 revolutions per minute.

☛Write them.



HOE'S PATENT BIT SAWS.

One of the best Bit Saws made, above cut represents usual size tooth, one size larger and smaller made. ☛Send for particulars and prices.

SAVE TIMBER GROW RICH

EMERSON'S EXTRA THIN SOLID SAWS

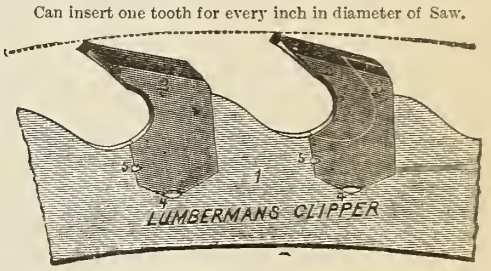
Having special facilities for the manufacture of extra thin saws for board mills, we are prepared to receive orders for Circular Saws as follows:—54 inches in diameter, as thin as 12 guage at rim and 11 at center, 54 to 56; 11 guage at rim, 10 at center, 66 to 72; 10 at rim, 9 at centre. Our unparelleled success with thin saws during past few years has induced us to recommend them to our customers. Our superior facilities are:—1st, Evenness of Temper; 2nd, Perfect Accuracy in Thickness, Saw balances perfectly; 3rd, Properly Hammered, to have equal strain in all its parts and at same time run true. This department is under the special supervision of J. E. Emerson, who has had 30 years experience and is without doubt the most successful circular saw maker in the world.

☛NO EXTRA PRICE FOR THIN SAWS.☚

EMERSON'S LUMBERMAN'S CLIPPER SAW

Can insert one tooth for every inch in diameter of Saw.

Extra Teeth 25c. each.



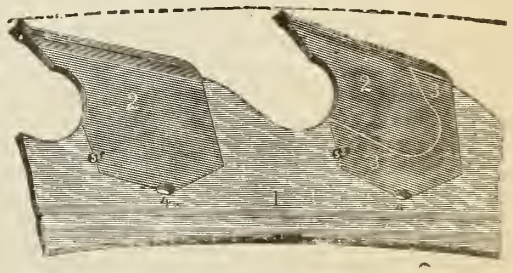
Extra Teeth 25c. each.

Designed specially for Thin Saws not thicker than 6 gauge at rim, or thinner than 15 guage at rim.

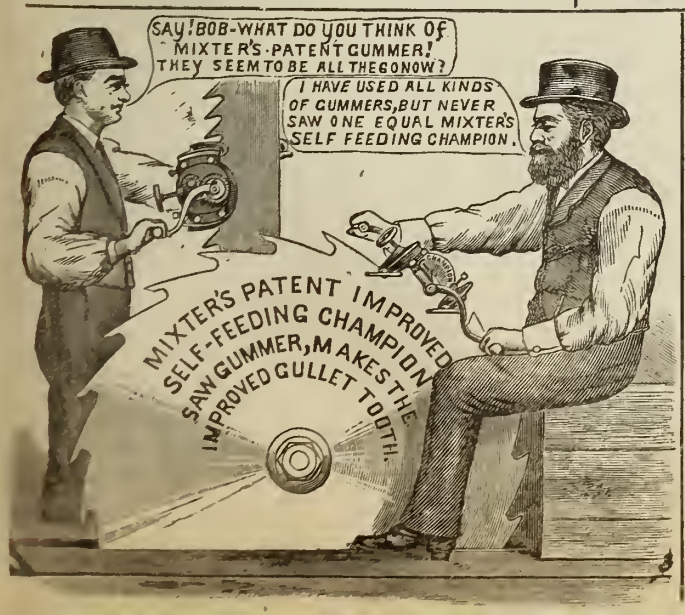
The CLIPPER FLANGE SAW

EXPRESSLY FOR HEAVY FEED.

Extra Teeth 50c. each.

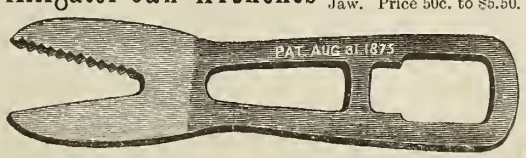


Two and a half inches long



Alligator Jaw Wrenches

5 sizes, grip from ½ to 3 inches, Iron. Solid Steel Jaw. Price 50c. to $5.50.



Cut represents No. 1. Larger sizes have Solid Handles.

WE KEEP IN STOCK ALL KINDS OF

Saw Mill Furnishings

SAW GUMMERS:—Stone's Original, large and smal size; Mixter's Self-feeding Champion; Emery Wheels and Stands.

SAW SWAGES:—Hoe's, Emerson's, Mixter's, and American Saw Co.; from $1.50 to $6.00.

SIDE FILES, BELT STUDS, Detachable Belt Fastners.

JARECKI'S PATENT SCREW, PLATE, and PIPE CUTTER, ½ inch to 2 inches, $28.00; smaller ranges in proportion.

Band Saws, Scroll Saws, Rainbow Saws for felling trees, American Shingle Saws, Lace Cutters. Cant Hooks. Flue Scrapers, Leather, Cotton and Rubber Belting.

SPECIAL AGENTS FOR GANDY'S PATENT MILL BELT, runs wet or dry; the best and cheapest main driver.

WORTHINGTON and BLAKE'S PATENT STEAM PUMPS. ECONOMIST PLANER and MATCHER COMBINED, large range of work, light, handy, durable, cheap.

Ewart's Detachable Chain For Log Jacks, Refuse Carriers, Sawdust Carriers, all sizes, Live Rolls, Tranfers, Slow Speed Driving Belts, Tie Loaders, Slash Tables, Trimmers, Lumber Sorters, Shingle Block Elevators, and many uses about a saw mill.

HIGH CLASS HEAVY and PORTABLE SAW MILL MACHINERY our Specialty.

Waterous Engine Works Co., Brantford

DIFFERENCE BETWEEN DRY ROT AND WORM-EATEN WOOD.

Dry rot is a term applied to damp wood under process of destruction by fungi, or low forms of vegetation. The albumen and the essential oils in the wood become the food of this secondary or parasitic vegetation; the woody tissue is broken up, and the walls of the cells destroyed, an earthy, powdery matter being left as the residue. This residuo bears on its face a close resemblance to burnt or charred wood. Indeed, it is akin to burnt wood, for the albuminoids and the essential oils which escape under the influence and form the flood of fire, have been consumed or absorbed by parasitic vegetation. The residue, an earthly, inflammable substance, is practically identical with that resulting from fire. Dry rot, or the destruction of wood by secondary forms of vegetation, is dependent upon two conditions—heat and moisture. To prevent dry rot, the wood is dried or seasoned, by which one of the elements is withdrawn. To guard against the return of this one element, the wood is painted or varnished, and hence the general application of paint or varnish. Where wood can not be painted, preservatives are used, the object of which is to change the character of the wood, so far as its secretionary matter is concerned. In this direction, creosoting is the most common or customary, the object of which is to poison the albuminoids and the essential oils, and so render them unfit for food to low or secondary forms of vegetable life. Salts, sodas and metallic injections have the same effect, but they are in a large degree soluble in water, and in course of time become weak or disappear, and consequently they are not so largely or generally used as creosote oil. The amount of moisture necessary for the support of the secondary vegetation is very large. This is supplied by humid or stagnant air, or by damp walls or subsoils, and hence it follows that wood subject to passing air, or brought under the influence of vegetation, is free from from this disease or dissolution.

Worm-eaten wood is wood injured by mechanical action—*i. e.*, by animal life. The same conditions are imperative to the support of this form of life as to the above, but the amount of moisture necessary in this case is very small compared with that required for the support of vegetation. Wood to be worm-eaten must be subject to damp, humid, or stagnant air, and it must be a sweet wood, or the sap of a bitter or pungent wood. Ash, elm, walnut, birch, beech, and limo tree are sweet woods, and very subject to worm. Oak and resinous woods are bitter, pungent or unpalatable, and, except in the sap wood, are fairly free or proof against the attack of worms. Under certain conditions, as in the roofs of churches covered down with lead, where condensation of the atmosphere ensues, and the wood absorbs moisture, the heartwood of even oak will fall a prey to the action of worms. In some cases the necessary moisture is supplied by the ends of the beams being inserted in walls, the materials of which are porous stone. Here the damp ends of the beams will be riddled with worms, and, spongo-like they will crumble away, and, if not supported, will fall clear of the walls. The heartwood in this case seems to have lost its pungent qualities and to have become soft with long saturation; but, not having been soizsd upon by fungi, to still retain its albuminoids, and to be sufficiently endowed with them to form the food of worms.—*Furniture Gazette.*

LOCATION OF A MILL.

The following contribution by T. G. Langdon, appears in the Indianopolis *Woodworker*:—The very first thing that should command the attontion of a person or company going into the lumber working business is the location of the mill. For a local retail trado a point in the centre of business is the great thing to be gained, and for a wholesale shipping trade to be near a place where putting lumber on board of cars or vessels or both, is the great end in view. But there is one thing common to both these trades which should be the first and great objective point: Ease of getting stuff to and from the mill, with the least trouble and expense of moving the stock. Every man that knows about lumber knows that it costs a great deal to handle it, and and if it has to be handled over three or four times where it needed to be moved but once, there is added a very great percentage to the cost of production, and if he has to compete with mills in the same business he will find himself doing less business with a larger amount of help, who are worked harder, and not producing as much as the company who has taken greater pains to have a mill where lumber can be handled at the least possible expense. The first point I would make is to have a mill located on perfectly level ground, so that teams with heavy loads as lumber teams usually draw can come and get away easily, and so that no help in or about the mill shall be used to load or unload teams. I do not take into account the item of insurance as a recent writer has done, for "constant vigilance" is the price of safety in planing mills. Sometimes mills are set on fire by catching from other buildings, but very much oftener they are caused by carelessness, not only of employees, but from owners themselves, who neglect to keep all places around the furnaces properly bricked up and partition walls made sound and secure from any possibilities of accident in that direction. One great thing in locating a mill is getting on good, firm ground, so that after the mill is up and the machinery in it will not be constantly settling down, which would be a constant source of annoyance from the shafting being always out of line and consequently always going hard and often breaking. Of course there is a remedy by piling, but piling if properly done is costly, and the land that must be pilod to set a building on almost without exception cuts off having a basement, which I consider a great advantage, because it is so desirable in all wood working machinery to belt from below. In places, however, which are affected by tides and overflowing of rivers I would by all means keep everything above water. The belting can be managed easy enough, only keep it out of the water. The great objectivs points is to have plenty of room in and about the mill—outside for keeping lumber and conveniences of getting around, and inside for handling and working it. It is very good to have pleuty of room to expand in, for everybody expects to increase their business and consequently they want room to do it in. Have a good reserve on hand so if you go into market and find somebody hard up and anxious to sell a million or two feet of lumber at a good discount, you have just enough room to put it in and not crowd you.

Now to a company just going into the lumber working business I would say, first sit down and count the cost, and provide yourself with ample means before starting, and having secured that, make a good plan of everything you want in your business, yard room (if you run a yard) with ample space for piling your lumber, and good avenues between the piles for teams to load and unload, and good generous sheds for storing nice dry dressed or rough lumber, with projecting roofs so teams can load and unload in storms without danger of getting stock wet; also a place for a good, generous dry-kiln, where a team can drive in and unload instead of leaving it outside and then have to carry it in by hand, thereby adding a large percentage of cost to production which *somebody must pay for.* And here will be a great item to be provided for. Plan if possible so that when a load of lumber is drawn in it can be left just where you want it, and not have to be carried even the shortest distance. Just here I want to contrast two dry-kiln rooms which I know of to show the difference in the cost of filling each.

In the one the teams drive alongside a shed, and breaking it across the wheel the teamster passes it up to the man on the shed, who carries it about 50 feet to a door where another man takes it and carries it 50 feet more and leaves it across a horse at the door of a dry room, where two men stick it up. The other case is a dry house on good level ground. The teamsters backs in and throws off his own load without help from anybody, and does it in half the time the other teamster can pass his load to somebody on the shed. In the first case the company want to utilize the heat from the boilers, and in the other the man wants to avoid the danger of fire by having the dry house away from the mill, and also to take as little help as possible to fill the dry house. To you who run lumber mills I will leave to decide which of the two are using economy in the matter of drying lumber. I bring this item of drying room in merely to show how much can be saved by having ample room for every needed convenience around a planing mill. To those not using a dry room it does not apply, but there are so many establishments that do use one that it is well to have them so that we can use them economically. Perhaps a great many will say, they have been long established and it would be at great expense to overhaul everything to suit their ideas of convenience. They are getting along comfortably well and making fair profits as they are, and are perhaps acting the parts of philanthropists in giving more employment to those who are needy and want the employment to support their families. This is all very well, but those who have to use lumber have to pay for the extra cost of production in some form or other. I know of several mills which if years ago some stray spark from a locomotive or some spite of an incendiary had caused them to be entirely burned up, that would, if built up with every convenience, have been far richer men to-day, and in some cases I think been kept from bankruptcy. In conclusion let me repeat: If you are intending to go into the lumber-working business in any form whatever, give yourself plenty of room for all your wants and a good reserve for increase of business. It is cheaper to own land and pay taxes on it than it is to hire a little nook and corner here and there, and pay a large rent to those who know they can make you, because you *must* have it, even if it is inconvenient. I know of parties to-day who would pay a much higher price for adjoining land for yard room than the land would cost in the market, and who could have had the same land a few years ago for a nominal price, and now they are paying twice the amount that the land would have cost them every year for rent. Other parties saw the future value of the land and wisely secured it, and it cannot be bought now. I have spoken in this article of the desirable outside convenience of the lumber-worker. In another I shall speak of the inside accommodations.

BOOMING PROFITS.

The *Northwestern Lumberman* says:—Since it has been proposed to restrict the charges of the boom companies in Michigan, there has been considerable discussion on both sides of the question. The proposed amendment is that the net dividends of the companies, after paying for all repairs, running expenses and losses, shall not exceed 20 per cent. on their capital stock in any one year, or 10 per cent. if the whole amount of capital stock has been paid to the stockholders. The following argument and figures are from the Saginaw *Herald*, the figures showing conclusively that stock in a Michigan boom company is a good thing to have:—

"The very nature of a boom company's business renders the occupancy of the river exclusive. Only one company can do business at one point. All the shores suitable for booming purposes are bought up or rented by one corporation. Logs cannot be stopped above its booming ground to raft and sort them; and below are the lakes, where the logs are lost if they have not been stopped and rafted. Under such circumstances competition is impossible. The monopoly is perfect, and whoever floats logs upon the stream must pass the boom and submit to the company's terms or run the risk of losing his property.

"Now, no man, however honest—and certainly no corporation—should be trusted with unlimited power to levy on other men for contributions. Such a power is sure to be abused. Yet the boom law of 1864 leaves this very power with every boom company, for it fixes no limit to the amounts which they may wrest from the log-owners to divide among their stockholders.

"The records of some of the largest companies in the state have been examined to show how they used their powers.

"The Manistee River Improvement Company, starting with a paid-up capital of $22,000, raised it to $100,000 by stock dividends, and in two years—1873-'4—divided among its stockholdsrs a greater sum than the whole amount of capital stock paid in by them.

"The Muskegon Booming Company began with a capital of $40,000, and ran it up in the same way until it reached $200,000. In 10 years it paid $246,265 in cash to its stockholders, and met, besides, all its expenses and losses, and paid for its improvements. In a single year it divided 200 per cent. on the whole cash capital originally paid in, and its cash and stock dividends for the ten years swelled to 1,100 per cent. on that sum. It still holds its $200,000 of nominal capital as the basis of future exactions to be continued while mills stand at Muskegon and logs are floated to them.

"The exactions of the Tittabawassee Boom Company have been more moderate. It is by far the most important corporation of the kind within the state. It has some thirty stockholders, of whom no one owns a controlling interest. It has watered its stock 100 per cent. only; and it has volunteered to reduce its dividends to a lower point than the other boom companies would consent to. But even this company, within the first two years of its existence, paid back to its stockholders in net dividends an amount of $15,000 greater than the entire capital ever paid in by them, and having thus reimbused them, it started out in 1867 with a capital stock which cost them $15,000 less than nothing, and has gone on collecting dividends varying from thirty to eighty per cent. and amounting in the aggregate, at the close of the present season, to $375,000 over and above all expenses, repairs, improvements and losses. Its average cash dividend for the first ton years was 47 per cent., and its total cash and stock dividends from 1865 to 1882 aggregated $425,000—an advance of 850 per cent. on its actual capital.

"Such facts as these abound also in the past and present management of other companies. Some of them, in defiance of public opinion, and against the protests of large minorities in their own board of directors, persist in demanding dividends twice as large as in the instances referred to. This is notably the case with the Rifle River Boom Company. But enough has been stated to show the need of legislation. What it shall be is for the legislature, to which this appeal is made, to determine.

"Uniform treatment of all companies, and a uniform measure of protection to all citizens, is indispensable to a just law. The price of rafting logs cannot be fixed in advance, and cannot be uniform. It must vary with varying conditions. But the profits of companies can be made uniform, for the profits of any corporation consist only of the dividends earned on its capital stock. In this respect the proposed legislation is most liberal. A company that could guarantee an annual dividends of 10 per cent. while it continued in existance, and the repayment of all its capital to its stockholders when it should be wound up, would command a high premium for its shares. But is better yet for the stockholders if they can have their capital paid back to them almost at the outset, and still have the right to a heavy dividend so long as the corporation continues.

"Another reason for this legislation is that it removes an apparently unjust discrimination in favor of capital as against labor. Capital and labor furnish the whole service of rafting and booming. The capital is worth from 4 to 7 per cent. per annum in the open market; and labor from $1.50 to $3 per day, if there is free competition. Now, if the laborers should combine to take possession of the outlet of a river, and should arrogate to themselves the sole right to do the labor at that point, fixing their own price and excluding all other men from competition, it would be an illegal act, to suppress which the military power of the state might be invoked. But no less vicious is it, even if done under the forms of law, that a few men should monopolize the booming grounds at the mouth of a great river; organize a boom company under a state law that fails to protect any one but the corporation formed under it; fix their own arbitrary valution on the property used or capital employed; exclude all competition, and then enforce the payment of any rates they choose for services rendered.

"Another reason for this legislation is, that without it there will never be uniformity of charges. While some companies are strongly influenced by public opinion, and, without legislation, reduce their charges, others, owned lar-

gely by men living out of the state, care no more for public opinion than the owners of railroad shares or lottery tickets. One company is satisfied with a dividend of 15 per cent.; another wants 20; and another will take nothing less than 30, and figure that upon its capital, watered stock and all.

"A general law alone can balance the scales of justice between the different companies, and between them and the citizens who are compelled to employ them."

FORESTRY IN THE NORTHWEST.

The Winnipeg *Commercial* says:—No question gathers around it much greater interest to the people of Manitoba and the Northwest than that of forestry. The preservation from unnecessary destruction of what timber we have, and the reproduction of sufficient to take the place of what is cut every winter is a subject for serious consideration by all. At a recent meeting of the American Forestry Congress, Prof. Sargent, of Harvard, read a paper in which he touched upon the matter. Referring to it, he pointed out that the question of tree planting must arise in the Northwest, and the sooner it is grappled with the better for the welfare of the future millions who are expecting to people the vast prairies west of Winnipeg. In the matter of fuel alone, its importance may be estimated from the fact that there are extensive tracts of western territory where the farmers journey from ten to twenty miles by wagon or sleigh in order to obtain fuel, or where they have to rely solely on the wood train which at intervals supply them; and such farmers are often exposed to positive suffering when extensive snow blockades take place. The prairie farmer indeed soon knows the value of a belt of trees upon his farm, not merely as a source of fuel and fencing, but even more as a windbrake, warding off the fierce blizzards and in summer sheltering his growing crops, fruit trees and stock from the strong prairie winds which, developing into storms, cause almost every season vast injury.

It is not at all improbable that the planting of forests on the prairies in Manitoba, Dakota and Iowa, will be the solution of that most embarrassing problem—the grasshoppers—by affording obstruction to the high winds which bring these insects from their habitats farther west, and by furnishing suitable homes for myriads of birds which would keep the increase of the grasshoppers in check.

The planting of forests will also probably solve the question of the successful growth of fruits in Manitoba and the North-West. Fruit trees need protection alike from storms and from parching winds, and especially in our western prairie country is this necessary. It has been laid down as almost an axiom in the Western States, that the forest trees must precede the fruit trees in order to afford such protection.

In Minnesota an earnest effort has been made to encourage the planting of trees. A State Forestry Association has been organized, and annually offers premiums for the largest number of trees planted on a day in May denominated Arbor Day. It is estimated that in the spring of 1877 there were 5,290,000 trees planted in Minnesota, and of these over half a million were put out on Arbor Day. During the entire planting season of that year it is believed that about ten millions of trees were planted, and of these, that about 70 per cent. have lived.

The question of tree planting is one which should be actively taken up at once in our North-West. The Government of Manitoba could not grapple with a more pressing subject for legislation, unless it be drainage. The greatest drawbacks against which the North-West has to contend, from an agricultural point of view, are wet lands, scarcity of timber and liability to high winds, and, in some localities, to summer frosts. Dakota and Minnesota have equally these drawbacks? The Manitoba Legislature has taken up the question of drainage, and active efforts are now being made in some parts of the country to reclaim the wet lands. To cope with storms and frosts seems hopeless, and yet experience has found the great value of belts of trees around each farm as affording effective shields against these. What the Government there should do is to promote Forestry Associations, and to in every way encourag tree planting by exemption from taxation or by direct premiums or bonuses. Any such encouragement successfully followed up will be returned one hundred fold in the larger and more certain crops, the store of wood for lumber and fuel created by the growing timber, the relief from the monotony of the prairie landscape through the belts of trees dotting the scene on every side, and not least, in a more contented and prosperous community of farmers.

ST. JOHN, N. B.

The St. John, N. B., *News*, of March 26th, says:—It is impossible at present to speak with any certainty of lumber prospects for the coming season. Builders are beginning to make inquiries for spring stock, and appear to expect to pay smaller prices than they did last year. Dealers are, however, holding off for better figures, as the cost of operating in the woods was much heavier this year than formerly. Reports from abroad so far favor the purchaser, and if the European markets do not brighten—which is hardly to be expected—there must be a general decline in our home markets. The changes in the American tariff have certainly not been in our favor, and no marked increase to our trade in that direction can be expected. Prices remain unchanged.

THE *Northwestern Lumberman* says that one reason why hemlock is not more used in the Northwest is that carpenters so generally object to it. It is more disagreeable to handle than pine, and the man who works it has a regard for his hands. It is harder on tools than pine, which is another reason that the objections are filed. The carpenters in the eastern states, being used to hemlock, will side a building with it without grumbling, and in the western states the knights of the plane will be compelled to handle more lumber than they are now doing, when, it is to be hoped, they will say less against it.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

The worst Scrofulous Sores, the most indolent Tumor, and the moust foul Ulcer known, may be cured by the combined use of Burdock Bitters and Burdock Healing Ointment. Ask your Druggist for these infallible remedies.

Daughters, Wives, Mothers, look to your health! The many painful and weakening diseases from which you suffer, dispairing of a cure, can be remedied by that unfailing regulator and unfailing tonic—Burdock Blood Bitters. Ask your Druggists for proof.

A SECRET.—The secret of beauty lies in pure blood and good health. Burdock Blood Bitters is the grand key that unlocks all the the secretions. It cures all Scrofulous diseases, acts on the Bl d, Liver, Kidneys, Skin and Bowels, and br gs the bloom of health to the palid cheek.

CRATEFUL—COMFORTING.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:

EARS FOR THE MILLION

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.

This Oil is abstracted from peculiar species of small **White Shark**, caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous**, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!

It has performed a miracle in my case.

I have no unearthly noises in my head and hear much better.

I have been greatly benefited.

My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

☞ To avoid loss in the Mails, please send money by REGISTERED LETTER.

Only imported by HAYLOCK & JENNEY. (Late HAYLOCK & Co.)

PETERBOROUGH, Ont. APRIL 16, 1883.

HOP poles have taken a tumble in the American market, due to an overstocked market.

A CHURCH is being built in Bavaria entirely of papier mache. It will be large enough to seat 1,000 people.

VENEERING is said to have originated with the art of cabinetmaking, and was used by the Egyptians 2,300 years ago.

ACCORDING to the Grand Rapids' *Times*, the Muskegon lumbermen will fall short 150,000,000 feet of their anticipated cut of logs.

SOME two hundred thousand feet of timber was purchased in Quebec on March 30th for the Grand Trunk Railway from R. R. Dobell & Co

THE Selkirk correspondent of the Winnipeg *Commercial* says:—The lumber left here last fall by the boats for transhipment to Winnipeg, is being moved by the C. P. R. at the rate of 20 cars per day.

OAK barrel hoops are got out on Puget Sound extensively and shipped to San Francisco, Cal., where there is a good market for them, at $22. Hazel hoops bring $5, $6 and $7, according to size and quality.

NEW ORLEANS is destined to become one of the most important lumber markets of the United States. The vast forests of Arkansas, Louisana, and Mississippi will furnish the supply, to be in time distributed throughout the world.

THE *Lumberman's Gazette* says:—Under the new tree-planting law in Canada, it is expected that hundreds of thousands of trees will be planted in the Dominion this spring. It is an excellent law, which it is thought will work admirably.

Pork has become one of the products of logging camps. When one of J. C. Brown's camps, Ogemaw county, Mich., broke up, lately, six or eight fat hogs were shipped to Saginaw. When the pigs throve like that on what is thrown away by the camp cook, the men must have lived pretty high.

THE *Southern Lumberman* says:—Surrounded, as we are in many places, by a virgin growth of timber, it is almost impossible to convince our people that tree planting is a necessity. Looking at our immense forests of to-day, standing in all their primeval beauty, it is difficult to realize that in a few years the best timber trees will have been felled; but it is a certainty, so sure as night follows day.

THE Grand Haven Lumber Company, of Grand Haven, Mich., can boast of the largest log that has been cut this year in the State of Michigan. The log was pine, and was cut about the middle of last month on the company's job at the head of Flat River. It measured 58 inches at the top and scaled 2,916 feet. The log is 16 feet long, perfectly sound, and measuring over six feet across the butt.

WE bespeak the especial attention of our readers for the large advertisement in this issue of the Waterous Engine Works Co., of Brantford. As will be seen they have a great variety of the most approved saws for mills, and supply all kinds of saw mill furnishings of the most improved kinds. The reputation of this firm is too high for it to be necessary for us to dwell upon it, and their customers need have no fear of disappointment.

THE Belleville *Intelligencer* says that in Gilmour & Co.'s limits, near Beaver Creek, the snow is seven feet deep on the level. The shantymen are "winding up" their work on that stream. The cut on that limit will be about 80,000 pieces, Exclusive of teamsters and jobbers 110 men and 80 teams have been employed all winter in the four shanties located in that section. The cut is expected to reach Trenton by the 15th of June.

THE Duluth, Minn., *Tribune* says that the men who are coming in from the woods this spring are pursuing a course rather different from that of former years. Instead of spending the greater part of their earnings in the saloons and in gambling, they are nearly all leaving town for the big farms of Dakota, or to take up claims, or to engage in other work further west. The sale of Northern Pacific tickets at the Duluth station has averaged $500 per day for several days past.

THE *Lumberman's Gazette* says:—Maine has been noted for its lumbering ever since the state was known. An eastern man working in the pineries, is alluded to even at the present day, as "a State of Mainer," no matter what state he hails from. Maine is evidently not denuded of its timber, or is securing the benefit of a reafforesting, The Maine *Journal* says that something like 110,000,000 feet of logs had been cut and will be floated down the Kenebec River the ensuing summer.

THE Muskegon correspondent of the *Northwestern Lumberman* says:—On the headwaters of this stream these is plenty of snow and good hauling, while nearer the mouth of the river there is still plenty of snow in the woods, but as there are more clearings, consequently the roads more exposed, the hauliug is poor. Quite a number of camps have broken up, having completed their jobs. I hardly think our jobbers or operators have got in within 50,000,000 or 75,000,000 feet of last fall estimates, but, with the old logs left over, there will be all the booming company and mills can handle.

THE *Northwestern Lumberman* says:—The project is to construct a railroad from Duluth to Winnipeg, and to have it pass through the Red Lake, Minnesota, pine timber region, and the Rainy Lake mineral district. The Duluth & Winnipeg Railway Company is an organization already chartered for this purpose, and it is said that work on the line has already been begun. The Grand Forks boomers want a road to Duluth also and propose to connect with the Winnipeg line at Red Lake. A better railroad scheme could not be conceived. If Duluth could secure these two roads, besides the Vermillion Lake line, her "zeuith" aspirations might yet be realized in part.

THE hurricane of 1865 blew over numberless cocoanut trees in the Bahama Islands. Instead of dying, each prostrate tree sent up an upright shoot from the tip. Now these branches are from twenty to forty feet in height and yield abundantly.

THE London *Timber Trades Journal* says:—Perhaps spruce sellers have found affairs as bad as most. A month ago they exhibited some little amount of firmness, and if deliveries had continued active an advance might have been established. But the demand fell away, and the heavy stocks of spruce deals, which at the commencement of the year we indicated were held at the inland wharves and railway depots. have evidently told with no inconsiderable effect. It is perhaps difficult to fix the exact market value of St. John spruce deals to-day. If a really good buyer were to place himself in form for a good line, he would doubtless find sellers extremely accommodating.

SUCCESSION OF FOREST GROWTHS.

The *Lumberman's Gazette* says that Robert Douglas, the great western nurseryman, gives, in a brief letter to the *Gardener's Monthly*, some interesting facts concerning the succession of forest growths—the result of years of observation. Where the forests are cut down and the fires are kept out, they in the main reproduce the same species. But if a settlement is formed and cattle allowed to run in the cut down woods, the seedlings are destroyed as they appear. In a burned forest everything is changed, all vegetation is swept away. Even the soil is changed, and its surface, if thin, is destroyed.

After a forest fire, the first tree that makes its appearance is the aspen (*Populus tremuloides*), a tree which naturally grows on moist lands, where its roots have the best chance to escape from the general destruction. According to Mr. Douglas, this tree predominates in burned forests in Colorado, Wyoming, Dakota, the Black Hills, Minnesota, Manitoba, Wisconsin and northern Michigan. In Wisconsin and the Black Hills it is mixed with the white birch, and occasionally, as in northeastern Wisconsin, the white birch is the chief tree. Both the trees and seeds of conifers are usually destroyed by fire, except sometimes *Pinus bandsiana* in northern Wisconsin, and *Pinus contorta* at high altitudes in the Rocky Mountains. The cones of these two pines are very hrad, and that fact may account for their preservation. Next to the aspeu and white birch, those trees and shrubs spring up over burned districts which bear seeds that are either blown to great distances, remain long in a dormant state in the ground, or are carried by birds. Where the burned forests consisted of oaks and pines adjoining, or partly intermingled, the oaks will be found after a fire crowding upon the pine lands. This is due in part to the fact that oaks renew themselves from the stumps, which pines do not, and that acorns are often burried by squirrels in spots favorable to their speedy growth.

Mr. Douglas raises a warning voice against the wanton destruction caused by forest fires, and thiuk the time has come when some method should be adopted to prevent their frequency and exteut. "Individuals like myself," he adds, "can only implore, but are powerless to prevent, such wanton recklessness; but the public press should arouse the people, the state governments or the national legislature to see that some plan is adopted to check this terrihle waste."

EXHAUSTING THE TURPENTINE FORESTS

Wilmington, N.C., March 30.—Those who ought to know say that it will not be very long before the turpentine orchards will consist only of dead pine trees. This is exactly in the line of the predictions of Ingalls in the Senate and S. S. Cox in the House when the Tariff bill was uuder discussion. Mr. Ingalls predicted that, at the present rate of consumptiou, it will require only seven years to exhaust the pine supply. In Wilmington the owners of turpentine stills say that within five years, as production is now averaging, the stills will indeed become very still. Already there is a marked falling off iu the production. The fearful craft that ply the Cape Fear River still bring down to port hundreds of barrels of rosin daily, but not so many as they did two years ago. Young trees that no turpentine gatherer would have thought of boxing for turpentine a few years ago are now drained for their valuable juice. It will not be long before a very serious scarcity will occur, unless something is done to protect the young growth.

A new danger to the pines arises from a very recent discovery of the possihilities of rosin. No longer will it be made the hutt of jokes respecting it use for fiddles and lager beer barrels, for it has been proved that it can be made to yield a very rich lubricating oil. It is cheaper than linseed, and combined with that oil, it is said, it makes the best lubricator in the market. Experiments are being constantly made, and now it is refined into three grades, the third yielding a drab-colored oil that is beginning to win high favor in the market. The lowest grade is sold to a Philadelphia firm that, by a secret process, converts it into the best axle grease. This development of the value of rosin is comparatively recent and is meeting with such success that it stimulates the production of turpentine and rosin to the great danger of a speedy exhaustion of the supply. There is a chance for a fortune in connection with this production of rosin oil. The man who can discover a process of deodorizing it may, if he can keep his process secret or patent the machinery, retire from business in a short time with all he wants to live on. The attempt has been made. A New York chemist set up his pots and kettles about a year ago in one of the yards adjoining a large still in this city, and fussed for a week with chemicals, making vile smells and viler smoke, but he failed and retired disgusted. If the oil can be deodorized it can be brought into common household use.

The immense tracts of land where once stood turpentine orchards, now exhausted, are not allowed to go to waste hereabouts. It has been found that this land produces a better rice than that of the South Carolina lowlands, and at the present rate of production it will not be long before North Carolina becomes the great rice-producing State of the Union. Something, however, will have to be done by the Legislature of the State, as was done in Maine, to save the forests, or before long its surface will be denuded of pine.

WHITE PINE AS A FOREST TREE.

BY JACOB W. MANNING, READING, MASS.

Our native white pine (*pinus strobus*), which was introduced into England by Lord Weymouth in 1702, and is there called the Weymouth Pine, extends to the 50th degree north latitude, west to Lake Winnipeg, south from Minnesota to the New England coast and along the Alleghanies to Northern Georgia.

It is one of the most profitable of all the pine family as fuel or as a timber tree. A piece as long as a stave for a pail, that can be cut from between the knots measuring a year's growth, is valuable, as well as the longest clear board plank or framing timber. It is always reliable, does not warp or crack as spruce or hemlock, and is light and durable as a building material.

Many open lands and forests abound in trees that will transplant safely, if six to twenty-four-inch trees, and even larger, are taken up with a ball of earth, which should be retained when the trees are planted, thus allowing the roots to be undisturbed; and I find after ample experience, if the holes are opened in the fall and allowed to remain open over winter, especially in hard land that is not to be cultivated, the frost will mellow the earth and put it in much better condition for the growth of trees when plauted the next spring.

On rough land, where stumps and rocks abouud, the distauce apart would be regulated by the lay of the land; they should be planted from three to seven feet apart. It is best to keep all cattle from a young forest.

This work could be done as the ordinary farm work with the usual force of men.

Thus many broken lots of laud now treeless aud so rocky and worn out that they would uot afford a payiug crop of rye or even buckwheat, and when used as a pasture would not pay the interest of $500 per acre for any number of years, could be made to increase in value year after year, with a small outlay at first and little

care after, so that it would be an investment from which a young man would realize a great gain, and no better legacy could be left by an old man to his sons; or if he wished to realize on it he could sell it at a much advanced price over the original value of the land and the labor put on it in planting the trees.

The growth of a pine in good soil in ten years after transplanting is ten to twenty feet in height, with a spread of branches six to fifteen feet, and a diameter of three to eight inches where they stand alone.

Allowing trees to grow in an open situation, with a wide spread of branches from the base up, gives the tree great vital force but makes knotty lumber; but in growing timber it is most desirable if free from knots, and this must be attained by close planting.

I have seen white pine come up from seed in an old worn-out pasture, full of rocks and running briars, that grew in forty to forty-two years to more than two feet in diameter, affording two ample board-logs and a heavy horse load of fuel, and all about it was a little forest of seedlings that required thinning out or transplanting, and all this from one seed that must have been carried many rods by the wind forty years before. Now these suggestions will apply to many almost useless pieces of land on which our New England farmers are paying taxes, but receiving no corresponding income. But on many pieces of barren plain land too poor to grow crops, but on which trees can be grown and cultivated, tree growing can be made more profitable if carried on systematically. The land should be thoroughly ploughed, the trees planted four feet apart each way, the cultivator run about four times a year until the trees shade the ground sufficiently to keep the weeds down. Wherever plantings are made the trees should be thinned often enough to allow their full development.

In all parts of New England, by taking away or planting the trees indigenous to the several sections, great changes are made in the landscape. This change is in the hands of landowners, and all should have an eye to effect some improvement in their day.

Little is said about aid from Government to renew the forest growth, although it is a giant task, but there is talk and even delay in tree-planting, in hope of aid and bounties or reduction of taxes to encourage it, also hesitation about what trees to plant. We say what grows well and sells well is safe to plant more of.

The most successful and praiseworthy of street, shelter belt or forest plantings that have been made, and, I might say, ever will be made, were by individual effort and purpose, and single-handed labor of one man here and there often in a very obscure way.

This work is greatly to be praised, and if any outside encouragement can assist to plant a few thousand acres with millions of trees each year, it will help to make more extended plantings appear easier to accomplish.—*Canadian Horticulturist.*

TIMBER CULTURE.

Minnesota legislators have "caught on" to the importance of timber culture, and have passed two bills looking toward its encouragement. One provides that every person who shall plant prairie land with any kind of forest trees, except black locust, and keep them in a thrifty, growing condition for a period of six years, shall receive three dollars per year for each acre of grove so planted. Persons planting forest trees along the public highway will be paid two dollars annually for each half mile so planted. Not less than 2,700 trees to the acre must be planted, of which at least 1,800 must be maintained in healthy, growing condition during the first two years after planting, and at least 900 must survive the whole period of six years. Trees along the highway must be planted not more than eight feet apart, and maintained in a healthy, growing condition for four years. Planting cuttings or sowing tree seeds is construed to be included in this act, but no person will receive compensation for the year in which such planting or sowing is done. This act does not apply to railroad companies planting trees within two hundred feet of their track, nor to persons acquiring land under the provisions of the act of Congress to encourage timber cultivation on the western prairies. The second act appropriates $5,000 to be paid to the Minnesota State Forestry Association to be by them expended in the promotion and encouragement of tree planting in Minnesota, by means of printing and distributing a manual of directions for planting and cultivating forests, procuring lectures and addresses on the subjects by persons skilled in that science, and disseminating the same through the public press; collecting information on the best methods of forest culture from persons in this state who have been successful in the same; by experimental cultivation of varieties of forest trees which are supposed to be adapted to this climate, or by procuring and distributing seeds and cuttings for the same, and generally to aid and encourage tree planting by any other means which they may think advisable. A portion of the money may be expended in measures for the protection of the forests already growing in the state, by publishing information as to the best manner of preventing forest fires, and otherwise protecting them, with directions for their proper thinning, replanting, etc., so as to produce systematic care of the woodlands of the state and their profitable use.—*Lumber World.*

LAKEFIELD, ONT.

Messrs. R. & G. Strickland have purchased from Messrs. Thompson Smith & Son their limits in the Townships of Ridont and Sherbourne. The timber and logs from these limits will come to Lakefield, their waters being tributary to the Otonabee River. These limits added to those previously in the possession of the firm will afford a supply to the Lakefield mills for many years to come. Messrs. Strickland have also purchased from Messrs. T. Smith & Son their large steam saw mill at Bradford, at which they purpose cutting the logs from the limits in Oakley and Hindon, which they purchased from the Dominion Bank the year before last, and on which they estimate that they have over 100,000,000 feet of lumber. This estimate does not include the Northwest quarter of Oakley, which Messrs. Strickland lately sold to Messrs. Thomson & Baker, of Hamilton, for $30,000, on which it is estimated that there is about 30,000,000 feet of lumber, but which the firm sold on account of its not being tributary to the waters in connection with their mills.

The capacity of the Bradford mill is 100,000 feet in twelve hours, and being situated on the Northern Railway, about forty miles from Toronto, it will find a ready market there, not only for the lumber, but also for the slabs and other mill refuse for fuel. It is possible that the Midland Railway may see the advantage of making an extension from Atherly to Black River, so as to put themselves in a position to carry the lumber of the extensive limits in the district. If this were done, Messrs. Strickland would remove the mill from Bradford to the Black River.

EXPERIMENTS made with cypress and walnut, and cypress and cedar, all prove that they will rot each other while joined together, but, on separation, the rot will cease, and the timbers remain perfectly sound for a long period.

THE Saginaw Bay and Northwestern logging road, recently purchased by the Michigan Central, says the Au Sable *News*, is hauling logs vigorously, and there is already banked on Saginaw Bay some 15,000,000 feet. This banking ground is said to be the largest one in the world. This road was acquired for business, and spur tracks will be put in from time to time, as may be necessary to reach timber tracts. This road, it is estimated, taps 1,000,000,000 feet of pine timber.

A KINGSTON correspondent says:—It is the intention of Mr. Fraser, of Almonte, to erect the largest mill in this section of the country at Cameron's Bay, Calabogie Lake. Mr. Mackie, of Ottawa, will also build a mill at Round Lake, which is about three miles from Gildersleeve's Rest on the Kingston and Pembroke. These mills will be ready to run by next spring. The amount of timber that will find its way to Kingston will then be doubled. P. McLaren will bring about 100 cars of timber more to Kingston this year than he did last.

TIMBER and other Consignments, and Agencies WANTED. Highest references. Address "Kaisar" care of Messrs. Deacon & Co., 150 Leadenhall Street, London, England. 3L7

VALUABLE
Timber Limits
And MILLS
FOR SALE,

CONSISTING OF:

About 300 miles of limits in the Counties of Joliette and Montcalm, in the Province of Quebec, well wooded with spruce, pine, cedar, and traversed by the La Quarreau, Dufresne, and other rivers.

About 25 acres of land (freehold) with a splendid water power and saw mill, store, dwelling house and outbuildings, on the La Quarreau River, at Montcalm, about 40 miles from Montreal.

About 100 acres of land (freehold) with a splendid Steam Saw Mill, capable of cutting 100,000 logs per annum, a large house for manager, 14 dwellings for employees, large machine shop, planing mill, bakery, store, fire engines and house, wharves, a steam tug, 3 barges, &c., &c., at Charlemagne at the mouth of the L'Assomption River, about 17 miles from Montreal.

Also, booms and dams on La Quarreau, Dufresen, L'Assomption, and other rivers.

Three vessels drawing 6 to 8 feet of water can load at the wharves at once, and ships, drawing 25 feet, can anchor with ¾ of a mile from the wharves, and load from barges.

The whole is complete and in running order for carrying on a large and profitable lumber business, and will be sold at a low price and on favorable terms.

For particulars apply to THE EXCHANGE BANK, Montreal, or to

JOHN M. M. DUFF,
Public Accountant,
3L8 113 St. James Street, Montreal.

VALUABLE
TIMBER LIMITS
FOR SALE,
Situated in the Nipissing District.

The following very desirable limits will be offered for sale at Public Auction (if not previously disposed of) at the

Grand Union Hotel, Ottawa, Ont.
—ON—
TUESDAY, 24th Day of April, 1883,
At 2.30 O'CLOCK IN THE AFTERNOON.

Berth No. 23, Nipissing.....36 square miles
do 43, Georgian Bay.....36 do
do 51, do .....36 do

BERTH 23 is heavily timbered and is very favourably situated for lumbering. The Canadian Pacific Railway crosses the south-west corner of the limit, and parties desirous of manufacturing lumber for shipment to Manitoba and the North-West would find this an excellent opportunity for establishing such a business. There is said to be a good mill site on the berth, with good facilities for piling and for shipping either west or east.

BERTHS 43 and 51 are adjacent limits, conveniently located for getting logs into Georgian Bay.

The terms and conditions of sale will be made known at the time of sale.

Further particulars may be had on application to Mr. W. H. Rowley, Manager of the Merchants' Bank of Canada, at Ottawa, Mr. Wm. Cooke, Manager at Toronto, or to

R. C. W. MacCuaig,
Auctioneer, Ottawa.
February, 28th, 1883. 3L6

MONTREAL TRADE.

As the season advances, the prospects of our lumber interests are brightening, there being now good reason for believing that the demand from the United States will be large during the approaching season, heavy building contracts having been given in New York and Boston, where large quantities of Canadian lumber are used. Enquiries from American buyers already indicate that they will need large supplies of Canadian pine, and we hear that one mill has made contracts for future delivery at very good prices, which show an advance upon several different grades. It was at one time thought that the make of lumber would be enormously heavy in the States, and thus produce an over-supply. This, however, has been obviated by the agreement just entered into between the large lumber firms in the West having their head-quarters in Chicago, whereby the make of the present season, instead of being increased as was expected, will be reduced 25 per cent. below that of last year. This, it is said, will cause more demand for the Canadian product, and the recent increase of inquiry lends credence to that opinion. There has been a considerable further advance in the price of laths, sales having been reported at $2.50 per 1,000, one party refusing to sell under $3. Last summer they sold at $1.35. In hard woods, ash is very scarce and prices are firm. There is an increasing demand for cherry, both from the States and the local trade, as this kind of wood is beginning to be used more freely and is taking the place of walnut. In other descriptions there is not much change. As regards the export trade in deals to the United Kingdom, and in lumber to South American ports, it is as yet too early to form an opinion, although some in the trade think that vessels will be as glad to take deals and lumber as they were last year.—*Gazette.*

WINNIPEG.

The Winnipeg *Commercial* says:—That lumber will be considerably reduced in price this year there cannot be any doubt. The enormous production, both in Canada and the States, will necessarily cause a reduction in prices. In the Lake Winnipeg and Lake of the Woods districts the output will be very large, much in excess of that of any previous year, and the abundant supply will tend to bring with it the drop in prices we have already spoken of.

Wood will be also plentiful, and there need not be any fear of a scarcity in that direction. One firm alone has 20,000 cords to bring into the city, and this is supplemented by large lots from other sources. This industry which is of vast importance to the city has been well looked after, and, so far as circumstances can be judged, there will be a good supply.

A CHICAGO LUMBER ASSOCIATION.

Considerable comment, some favorable, some decidedly the reverse, has been caused by the formation of the Northwestern Lumber Manufacturers' Association, whose object is to strengthen the wholesale lumber market. A meeting of the manufacturers was called at Chicago, March 8, and was attended by representatives from nearly every prominent manufacturing point between Lake Huron and the Upper Mississippi, except the Saginaw valley. It was the unanimous opinion of those present that an orginization of manufacturers was desirable. It was further agreed that the cut of the coming season should be reduced to some extent, but how much and the means of securing the reduction were not so easily decided. A committee of nine was appointed to harmonize varying plans and prepare a scheme for permanent orgaization. This committee, in the afternoon, reported as follows:—

Your committee, considering the fact that there is a prospect of an overproduction of lumber for 1883, and that to prevent such an overproduction a system of curtailment is necessary, recommend as follows: 1. The committee recommends a reduction upon the actual total production of lumber for 1882 of 15 per cent. 2. That any mills on or tributary to Lakes Michigan, Huron or Superior start up on May 1. 3. That, as far as possible, no mills on the Mississippi or its tributaries start up before May 1. 4. That the lumber manufacturers organize into an association, with powers to secure the carrying out of the above recommendations.

This report was adopted, and the convention further proceeded to the adoption of a constitution and by laws. It was, however, stipulated that these should not become binding until signed by firms representing the manufacture of 4,000,000,000 feet of lumber last year. The board of directors, to consist of fifteen persons, were empowered to regulate the production of lumber in any season subject to the will of the members as expressed at the annual meetings to be held in the month of September. It is estimated that the delegates present represented a production of fully 3,000,000,000 feet, and it is thought that the requisite 4,000,000,000 feet, to render the action of the association binding will be secured. In conclusion it should be said that the organizers of this association expressly disclaim any intention of "booming" lumber prices. They think that white pine lumber is now selling at no more than legitimate value and all they desire is to prevent the market from being depressed by over-production, so that lumber shall not bring its real value.—*Lumber World.*

NORTH WEST TIMBER.

We extract the following from the annual official report of the Minister of the Interior:

DEPARTMENT OF THE INTERIOR,
TIMBER, MINERAL, AND GRAZING LANDS OFFICE,
OTTAWA, 31st December, 1882.

SIR,—I have the honor to submit the third Annual Report of the Timber, Mineral and Grazing Lands Office of the Department of the Interior.

A statement showing the revenue derived from Crown Timber, Mineral, and Grazing Lands for the departmental year ending 31st October last, is appended hereto, together with the report of the Crown Timber Agent at Winnipeg.

Returns from saw mills show the following quantities of building material as having been manufactured during the year:—

	Feet B. M.
Sawn lumber	26,673,267
Shingles	6,450,311
Lath	2,251,100

New mills being operated by the undermentioned firms commenced sawing during the season:—

Messrs. Drake & Rutherford, Fisher River, Manitoba.

Messrs. Shields, Haggart & McLaren, Shell River, Manitoba.

The Morton Dairy Farming Company, Turtle Mountain, Manitoba.

Mr. W. Stubbs, Ebb and Flow Lake, Manitoba.

Messrs. Lethbridge & Co., Beaver Creek, Porcupine Hills, Alberta.

Mills are being operated by the following firms west of the Third Initial Meridian:—

Messrs. McKay (Stobart, Eden, & Co.,) Prince Albert, Saskatchewan.

Messrs. Moore & Macdowoll, Prince Albert, Saskatchewan.

The Hudson's Bay Company, Edmonton, Athabasca.

Messrs. Hardisty & Fraser, Edmonton, Athabasca.

Messrs. Lethbridge & Co., Beaver Creek, Alberta.

The Cochrane Ranche Company, Fort Calgary, Alberta.

Mr. P. McLaren, Pincher Creek, Alberta.

The St. Albert Mission, St. Albert, Athabasca.

The following is a statement of correspondence, applications received, and returns examined:—

Number of letters received	3,579
" letters sent	3,109
" timber limits applied for	684
" mineral locations applied for	746
" mill sites applied for	11
" applications for grazing lands	154
" returns from mills received and checked	113
" licenses for timber limits drawn	25
" returns of permits received and examined	43
" instructions issued for survey of timber limits	34
" returns of surveys of timber limits received and examined	8
" leases for coal locations drawn	7
" " grazing lands "	39

I have the honor to be, Sir,
Your obedient servant,
G. U. RYLEY.

The Deputy of the Minister of the Interior,
Ottawa.

Statement of Receipts on account of timber, for the twelve months ending 31st October, 1882:

CROWN TIMBER OFFICE,
WINNIPEG, 31st October, 1882.

SIR,—I have the honor to submit the following report of the work of the Crown Timber Office, Winnipeg, for the year just closed.

Statements showing the revenue derived from Crown timber, the number of saw mills operating under Government license in the Province of Manitoba, Keewatin, and the North-West Territories, as far west as the Third Initial Meridian, with the quantities of building material manufactured and sold by each lessee, respectively, during the year, and other information regarding the business of this office, will be found hereto appendod.

It will be observed that many of the saw mills shown in the report of last year are not included in the schedule I attach, owing to the fact that some manufacture exclusively logs imported from the United States, while others are small portable mills brought in to cut timber from lands no longer in possession of the Crown; also, that the saw mills shown as situate in the North-West Territories west of the Third Initial Meridian are now outside my Agency, being included in the Saskatchewan District, under the charge of Mr. Thomas Anderson, at Edmonton.

An examination of the returns from saw mills shows the following quantities of building material as having been manufactured during the year:—

	Feet B. M.
Sawn lumber	25,465,871
Shingles	6,442,182
Laths	2,251,100

showing a large increase over the returns of last year.

The following statement shows the amount of correspondence, number of permits issued, number of seizures made, and number of mill returns received and checked:—

Number of letters written	1,766
" " received	1,392
" permits issued	580
" seizures made	85
" mill returns received	121

The following changes in the ownership of timber limits have been made during the year:

Mr. Joseph Whitehead assigned to Mr. David Ross.

Mr. Robert McIntosh assigned to Mr. J. W. Douglas.

Mossrs. Roberts & Whimster assigned to Messrs. Whimster & Kayll.

Mr. Donald Gunn assigned to Mr. E. P. Leacock.

Messrs. Cumming & Co. assigned to Mr. James Kent.

Mr. W. J. Macauly assigned to Messrs. Dick & Banning.

Mr. S. H. Fowler assigned to The Rainy Lake Lumber Company.

Leases of limits to the following parties were cancelled, viz.: Mr. John McBeth and Mr. R. Z. Rogers.

The total cash receipts forwarded by Deposit Receipt in favor of the Hon. the Receiver General amount to $61,369.16.

The total revenue derived from timber, including $36,000 from the Canadian Pacific Railway Company for construction timber, the account for which was adjusted at the head office, amounted to about $97,639.16. Compared with the previous year, the increase in revenue is $53,134.99.

The expenses incurred in working this office amounted to $1,871.43, which, compared with those of the previous year, show a decrease of $709.43.

Since my appointment as agent I have conducted the business of this office with the assistance of one temporary clerk.

Statement of Receipts on account of Crown Timber, for the twelve months ending the 31st October, 1882.

E. F. STEPHENSON,
Crown Timber Agent.

CROWN TIMBER OFFICE,
WINNIPEG, 31st October, 1882.

GIRDLED TREES.

Usually a girdled tree soon dies; but it would appear from the following statements of Mr. W. H. Ragan, of Clayton, Ind., that such is not always the case:—"Hon. F. Beeler, General Superintendent of the Indiana State Board of Agriculture, living four miles southwest of Indianapolis, has a Scotch pine tree from which the bark has been removed for a space of almost a foot, when about three inches in diameter. At this point the wood is as dry and lifeless as a table leg, but above, the top is healthy, making regular and thrifty annual growths, bearing and perfecting seed, and to all visible appearance as healthy as though nothing unusual was the matter with the tree. This condition has existed for years, and the growth above the girdled point has increased to more than three below. This tree was girdled by the sapsuckers. The other is a tree of the same variety on the farm of Allen Miles, two miles east of Belleville, in Hendricks County, Ind., which was completely strangled by an iron ring, two and a half inches in diameter, being dropped over it some years ago. Below the ring for several inches the wood is dead and dry as though it had been in a dry kiln for years; above it is greatly enlarged, perhaps quadrupled in size, and still alive, though declining."—*Lumber World.*

THE *Northwestern Lumberman* says:—Some of the prominent yellow pine manufacturers have been considering for some time the propriety of making a move in the direction of a reduction of cut. They recognize the same fact that is acknowledged in the Northwest, that there is an overproduction of lumber, and believe that a healthier trade would result if there was less lumber to go on the markets. But how to decrease the speed of the mills is a problem which not one of the favorers of the scheme has satisfactorily settled, even in his mind. To bring into a combination all the men owning and operating mills in the South, would be impossible, so long as many of them have no money ahead, and doubtless it would be impossible if they were all financially independent.

Chips.

SIX million feet of lumber are said to be consumed annually in the toy manufacture of the United States.

ON the Pigeon river, in Haywood County, there is a comfortable country church built of the lumber from a single poplar tree.

THE Phœnix Furniture Company, of Grand Rapids, Mich., recently received 50,000 feet of mahogany from the Sandwich Islands.

ARRANGEMENTS are being made for the shipment of a large amount of Canadian lumber through Duluth to Winnipeg the coming season.

THE council at South Grimsby has taken advantage of the new act for the encouragement of tree planting, and in a few years the highways and byways of that township will be as shady as the forest, and summer travellers will bless the wise men of the council.

THE Roscommon Lumber Company, of Roscommon, Mich., now has eight miles of logging railroad, besides branches and sidings, and runs ten log trains daily, of 2,000 feet each, which makes an average of 200,000 feet daily that the company is putting in Houghton Lake.

THE *Northwestern Lumberman* says that a Georgian Bay lumberman is negotiating with the St. Paul & Duluth road for the shipment of 25,000,000 feet of lumber via Duluth to Winnipeg, Manitoba. He intimates that this is only a drop in the bucket compared with what is to come.

THE Morris correspondent of the Winnipeg *Commercial* says that Messrs. Aitchison & Reilly, of Winnipeg, formerly of Ontario, are talking about starting a planing mill at Morris. This is something very much needed, and we hope the gentlemen named will complete arrangements.

THE Keewatin correspondent of the Winnipeg *Commercial* says :—Lumber is being shipped from here to Winnipeg and westward at the rate of seven cars daily. Messrs. Dick, Banning & Co.' yard is almost empty, but the Keewatin Lumber Company appear still to have a good stock on hand.

The London *Timber Trades Journal* says :—We understand that upwards of 12,000 standards of the BS1stSC Bjorneborg make, for delivery during the season, have already been placed by the agents of the stock, Messrs. Scheydt & Gallatly, in England, Scotland and France, at very favourable prices.

THE Grand Haven Lumber Company's new shingle mill, which has a capacity of one million feet per day, employs two hundred men and boys, and is claimed to be the largest shingle mill in the world, is completed, and steamed up March 15 for trial. It will commence running as soon as spring opens.

THE Boston Lamina Wood Company, Boston, Mass., are making tea and grocers' scoops upon a new and interesting plan. They are made of three-ply wood, the middle stratum or layer being placed with the grain of the wood running at right angles to that of the two outer layers. They are finished with two heavy coats of orange shellac. These scoops will not curl up, like tin, when striking a nail, and they are free from rust.

THERE are several reasons why walnut lumber will probably decline in the future, but the greatest reason is that while the production has been facilitated by almost every conceivable means, including extensive additions for cutting and transporting, the erection of new mills and tramways, piercing hitherto inaccessible regions in quest of it, the demand is likely to perceptibly decrease, owing to the fact that fashion has decreed that walnut is for a period at least superseded.

THE Trenton *Courrier* says :—Gilmour's mills are waiting for a move in the ice, to commence operations night and day, with a double gang of men. A new engine and six new boilers have been built to drive the shingle mill. It is reported that Mr. Gilmour has relet the building of a dam across the river at an advance of 25 per cent. to Mr. Dinwoody of Campbellford. The intention is to erect a sash, door, blind and moulding factory on the dam. The subject of a bonus for the building of the dam will likely be discussed at the next regular sitting of the Town Council.

A LUMBER KING.

The Kingston *Whig* says :—Last evening a *Whig* reporter met the burly form of Mr. Peter McLaren, probably the greatest lumberman in Canada. He has been most prominently before the public for some time through his celebrated dispute with Boyd Caldwell concerning the use of the Mississippi River. The case having gone through the Canadian courts will now be laid for final decision before the Privy Council. We had thought Mr. McLaren was a a Scotchman, but that idea he dissipated. In answer to a question he said he was a native of Ontario, born in Lanark and residing in that section of the country all his life. His father was one of first lumbermen in the district, there he lost all his wealth. He died when his son was 12 years of age.

About 20 years ago the subject of this sketch began lumbering on the Mississippi. He has thrived wonderfully, and can now probably count his wealth by hundreds of thousands. He is a genial man and has many friends in this city, which he visits frequently. Of course, lumbering is his great theme in conversation, and the reporter learned that the past winter had been a remakably good one for operations in the woods. The snow has been so well distributed that there is very little trouble in moving about the timber limits. The ice has also been firm, and now on all the tributaries of the Mississippi there is piled the product of the winter's work.

The chief streams in Mr. McLaren's limits are South, Molloy, Bear and Louse Creeks. The shantymen are working in the townships of Clarendon, Palmerston, Barrie, Olden and Abinger and as many as 230 teams have been employed. The remuneration per day is $1.50 and findings for man and beast. About 350 men have been at work, and they have drawn salaries ranging from $18 to $45 per month inclusive of board. The supplies in quantity are simply enormous and are despatched almost daily from Kingston in cars, or by teams from Perth and Carleton Place. The pork, beans and bread consumed by the men whose appetites have been sharpened by the keen air and muscular exercise is astonishing. The food devoured in one day in the shanties would afford a meal for nearly the whole population of Kingston.

The cut this year will be about 80,000,000 feet of lumber and 8,000 pieces of square timber. The lumber wtll be sawn at Mississippi Station on the Kingston & Pembroke Railroad, and at Carleton Place, where Mr. McLaren has two fine mills. The square timber will be brought to Kingston by train, rafted and sent by tows down the river. The expense is cheaper by this route than that by which timber was sent to Quebec some years ago. Palmerston, on the Kingston & Pembroke Railroad, is the chief distributing depot of Mr. McLaren.

THE *Call* notes the sale of property on Lake Superior. The sale was by a Canadian firm, who had built the mill, running two circulars with lath and edging works, shingle mill and all auxiliary modern devices, who had built also a store and fine boarding house, and who owned a tug and lighters and all requisite facilities for carrying on the business ; of 50,000 acres of pine land, all the land on Whiskey bay, so-called, a little distance above Sault St. Marie, giving boomage facilities for 200,000,000 feet of logs ; timber estimated at 250,000,000 feet, of which 11,000,000 will be got in this season and sawed before the close of 1883. The parties purchasing are Louis A. Hall and A. A. Buel, of New York, consideration not stated. The timber is of good quality, the river which comes in at the bay is navigable for 30 miles from its mouth ; every facility is at hand for carrying on the business of lumbering in its most comfortable and advantageous methods.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

C. NORSWORTHY & CO.,

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

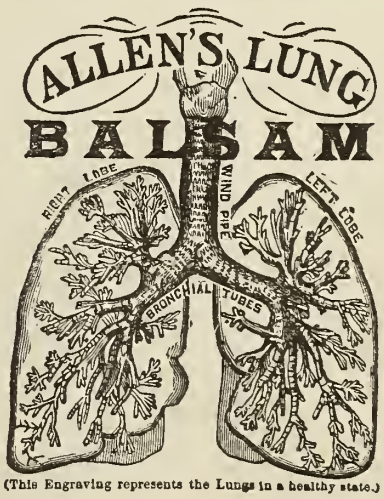
Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1yl7



(This Engraving represents the Lungs in a healthy state.)

THE WAY IT WILL AFFECT YOU.

It excites expectoration and causes the lungs to throw off the phlegm or mucous; *changes the secretions and purifies the blood;* heals the irritated parts; gives strength to the digestive organs; brings the liver to its proper action, and imparts strength to the whole system. SUCH IS THE IMMEDIATE AND SATISFACTORY EFFECT that *it is warranted to break up the most distressing cough in a few hours time*, if not of too long standing *It is warranted* TO GIVE ENTIRE SATISFACTION, EVEN IN THE *most confirmed cases of Consumption! It is warranted not* to produce costiveness (which is the case with most remedies), or affect the head, as it contains no opium in any form. *It is warranted to be perfectly harmless* to the most delicate child, although it is an active and powerful remedy for restoring the system. *There is no real necessity for so many deaths by Consumption*, when ALLEN'S LUNG BALSAM will prevent it if only taken in time. Physicians having consumptive patients, and who, having failed to cure them with their own medicine, we would recommend to give ALLEN'S LUNG BALSAM a trial. *Sold by all Druggists.*

PERRY DAVIS' VEGETABLE PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

Market Reports.

TORONTO.

From Our Own Correspondent.

APRIL 9.—There are complaints just now on the part of the retail dealers for the want of sufficient trade to keep their staff of men and horses employed, but on investigation I find that this dulness is not common to all the yards, some dealers avowing that they have all they can do to supply orders as fast as wanted. I think an explanation of this difference may be found in the fact that new streets through properties not hitherto placed on the market, are being opened from time to time in various parts of the city, and a building spurt takes place first in one locality and then in another, and often some miles apart from each other, and it is quite natural that those dealers having the yards nearest to the locality being built upon should enjoy a monopoly of the trade for the time being, although this is not always the case as some dealers whose yards are far remote from the scene of operations, will cut on prices, and deliver a bill for a less sum than others close at hand. In some instances I have known quotations for bills ranging in value to say $500, on which quotations by different dealers varied one tenth of the entire sum, and this, I presume, will continue to be the case until such times as dealers have the good sense to unite and decide on a scale of prices from time to time as the state of the lumber market may warrant them. There is really no valid reason why dealers should vary five dollars on a bill of moderate dimensions, the class of timber to be supplied being equal.

The stocks at all the yards are fully up to the mark as to the quantity usual at this season of the year, and, with the exceptions noted above, prices remain at same quotations as formerly furnished you. The main questions now agitating the mind of shippers and mill men, are, when will navigation commence, and how will trade open up with our cousins over the way? With regard to the former question we may safely assume that nothing will move from our wharves here of any consequence before the 1st of May, and in regard to the latter, opinions are extremely conflicting, but the writer's ideas have not altered, and the views expressed in former letters, will, I think, be found to hold good, and at the close of the season it will be found that we will not have any surplus stocks left on hand above that usually held, and that fair prices will rule on the market during the entire season.

CHICAGO.

The *Northwestern Lumberman* of April 7th, says:—The salient features of the lumber trade at the moment are these: Considerable activity at Saginaw, at apparently firm prices, fully as high as they were last year at this date; a heavy movement from all the markets west of Lake Michigan, at prices prevalent all winter; nothing noteworthy on the east shoro of Lake Michigan, but an active demand at railroad points in the interior of the state, and rapid shipment therefrom; an increasing trade in New England; the opening of the Hudson, and a forward movement of lumber-laden barges at Albany for New York and vicinity; a revival of demand at Oswego for rail shipment, and a general postponement of navigation on the lakes on account of the ice-bound condition of coast-line and harbors.

In reference to the coming season's supply of logs, it may be generally said that there are plenty of them, and in Michigan they are selling at good figures, as high as $18 having been realized in one transaction at least.

Receipts, and stock on hand of lumber, shingles, etc., for the week ending April 5, as reported by the Lumberman's Exchange:

GLASGOW.

The *Timber Trades Journal* of March 24, says:—The imports of wood to Clyde during the past week include a small cargo of pitch pine arrived at Greenock, and one of mahogany at Glasgow, also parcels of walnut and staves, &c.

There has been two auction sales held, particulars of are noted below. The Greenock sale attracted a large company, rates steady, and a good business done.

AUCTION SALES.

On 15th inst., at Glasgow, Messrs. Singleton, Dunn, & Co., brokers:—

		per cub. ft.
Quebec 1st yellow pine deals—		
11 ft	12/25×3	3s 1d.
11 & 12 ft	7/10×3	2s 6d.
Quebec 3rd yellow pine deals—		
16 ft	11×3	1s 1¾d.
10 to 16 ft	11×3	1s 1½d.
10 " 13 "	10×3	1s 0½d.
10 " 13 "	9×3	1s 1d.
10 " 13 "	7/8×3	11¾d.
Saguenay 3rd yellow pine deal ends—		
8 ft	7/11×3	10¾d.
4 & 5 ft.	7/0×3	9¾d.
St. John, N. B., spruce deals—		
20 ft	0×3	11½d.
Quebec 2nd spruce deals—		
13 to 16 ft	11×3	12d.
12 " 14 "	9/16×3	11½d.
12 " 16 "	9×3	11½d.
14 " 16 "	8×3	11d.
11 " 16 "	8×3	10¾d.
12 ft	7×3	10½d.
Do. 3rd spruce deals—		
13 ft	11×3	11½d.
13 "	9×3	11d.
11 "	9×3	11d.
10 "	9×3	10¾d.
14 to 16 ft	8×3	10¾d.
10 " 13 "	8×3	10½d.
12 " 16 "	6/7×3	10¼d.
Quebec oak planks—		
14 ft	12×5	2s 4d.
5 to 12½ ft	12×5	1s 11d.
5 " 8 "	10/14×3½/5	1s 10d.

On the 20th inst., at Greenock, Messrs. Singleton, Dunn, & Co., brokers:—

Quebec waney boardwood (chiefly B quality)—
About 500 logs, 45 to 58 c. ft. av. per log, 1s. 11½d. to 2s. 3d. per c. ft.

Do. yellow pine timber (180 logs)—
60 c. ft. av. per log, 1s. 7½d. to 1s. 10¾d. (chiefly 1s. 8½d) per c. ft.

Do. yellow pine timber (60 logs)—
45 c. ft av. per log, 1s. 4½d. per c. ft.

Do. red pine—
40 to 50 c. ft. av. per log, 1s. 4½d. to 1s. 5d. per c. ft.

Do. (about 500 logs sold)—
30 to 35 c. ft. av. per log, 1s to 1s. 1½d. per c. ft.
25 " 11½d. "

Do. oak (100 logs)—
50 to 60 c. ft. av. per log, 2s. 6½d. "

Do. elm (40 logs) inferior, 1s. 6½d. "

Do. hickory (7 logs), 1s 7½d. "

Pensacola hewn pitch pine—
80 c. ft. av. per log, 1s. 4½d. "
60 " 1s. 2¾d. "

Do sawn pitch pine—
45 c. ft. av. per log, 1s. 4½d.

A large cargo of St. John, N. B., spruce deals was exposed, and about one-third sold, 8/13×3 in., 10d. to 1s. per c. ft.

LIVERPOOL.

The *Timber Trades Journal* of March 24, says:—There is not much change in the condition of our trade from that noted last week, as the dull and depressed state of the demaud from the manufacturing districts continues without alteration. Of course, there are exceptional articles iu the market which hold a strong position, such as teak and mahogany, arising from various peculiar circumstances, but for most of the leading articles in the trade there is uothing note worthy to remark about them, if we except pitch pine timber, especially sawn wood, which has made a decided upward movement during the past week or two, and from the continued scarcity of vessels there is every prospect of such an advance not only being maintained, but of being still further raised within a very short time. Buyers who declined to purchase at rates current a fortnight or three weeks ago now begiu to find out their error, and are anxious in their endeavors to get hold of handy cargoes at prices at which they would have scoffed a short time ago; consequently there has been much more business done in this line recently than has been the case hitherto.

On the other hand spruce does not seem to improve in price, although the stocks are light and no ships are loading at present; but as the time is now near when deck loads are permitted to be carried, there may be some vessels taken up to load from St. John, N. B. At the same time shippers complain that the prices obtainable in the United Kingdom are at present so low there is no inducement to ship; and, therefore, the exportation will be curtailed until paying prices are obtainable on this side.

LONDON.

The *Timber Trades Journal* of March 24 says:—The long-looked-for revival of trade has not as yet made its appearance, and business generally continues in the same dull state that we have become so accustomed to lately. We have once or twice experienced dull spring seasons, but they generally followed after an especially active fall trade, but there was nothing denoting any briskness in the business done last autumn, and hardly any free-on-board sales entered into for first open water. The present lethargy has continued from the close of last year, with hardly any brightening up of consequence to enliven its monotony. Outside the public saleroom, buyers have been few and far between, and we believe more will be done in the way of consignments thls season than is usually the case, owing to a considerable portion of the first open water goods being as yet unplaced.

TYNE.

The *Timber Trades Journal* of March 24, says:—A little more business is reported generally, but the quantity doing is not great, and leaves great room for improvement. The shipbuilding trade still causes a demand for American goods, and these, with the exception of pitch pine, are firm in price. Of the latter wood heavy stocks are held, and prices are very low. American yellow pine deals are becoming scarce, and prices are a good deal firmer.

NEW BRUNSWICK.

The St. John, N. B. *Sun* says:—The lumbermen on the Bay Shore have had a very fine winter for their operations. It is feared, however, there will be a short supply of water, as there is very little snow in the woods. The amount cut by different operators from St. Martins to Salmon River, Alma, is estimated as follows:—

J. & W. Rourke, St. Martins	3 Millions.
Wm. Davidson, Big Salmon River	8 "
" Mosher's Beach	500 M.
" Martin's Head	2 Millions.
G. J. Vaughan, Little Salmon River	3 "
Geo. Walton, Wolf Rock	1 "
Guy, Bevan & Co., Martin's Head	2 "
Joshua Prescott, Goose Creek	2 "
C. F. Clinch & Son, Point Wolf	5 "
Alma Manufacturing and Ship-Building Co., Alma	6 "

SAGINAW RIVER.

EAST SAGINAW, Michigan, March 27.—Some camps are breaking up and others are hauling. Unless a lumberman is forced to, it is poison for him to break camp, so long as the roads will permit a log to be moved; and many who have accomplished all they calculated on when they went in, are still at work. The roads are good, and there is an abundance of snow, with cold nights. A lumbeaman said to me to-day, "We are, taking old logs into account, 100,000,000 feet short of the amount in at this time last year." This may be so, but it by no means presages a log famine. I apprehend the mills will have all the stock they can comfortably attend to. The rivers are full of ice, and signs of a break-up are not apparent. Wright & Ketchum have put iu about 20,000,000 feet over their log railroad, and expect to haul logs until July 1. Bad river will turn out 7,000,000 feet of hardwood and pine logs. Cass river is good for 10,000,000 feet, the greater portiou of which is hemlock and hardwoods. Murphy & Dorr have broken up one camp on the Rifle, the crew coming out yesterday, and one on the Chippewa. In all they have operated six camps, and have

two or three jobbers putting in logs for them. Their total product will be about 20,000,000.—*Northwestern Lumberman.*

VENEERING.

Of recent years inlaid veneer or marquetrie has attained a remarkable position, and may be said now to have established itself as a permanency in the cabinet work of the age. A quick way of making this inlaid work that has been employed in the United States for some time is to arrange the pieces of veneer alternately—walnut and maple, for instance—and with a very fine marquetrie saw cut the pattern through all the pieces as they lie piled upon each other, thus arranged according to the kind of wood. When this is dône the cabinet-maker has a quantity of veneers before him of various woods with the pattern cut out of each, and on the other hand a quantity of fragile cuttings in larger pieces. All that is now necessary to be done is to set the maple pattern in the walnut veneer, or *vice versa*, and the marquetrie is complete. This has the double advantage of cheapness and durability, and the process is one that has the merit of allowing rapid work, and usually of a satisfactory character.—*The Woodworker.*

THE ATHABASCA.

From a description of the Athabasca River in the Edmonton *Bulletin* we take the following extracts:—"The pass from the Athabasca to the Columbia is known as the Whirlpool pass, and is very high at its summit. The valley of the river between the two ranges of mountains is barren and rugged, with little timber, but the sides of the mountains for a considerable height are well timbered with spruce, poplar, silver pine and hemlock. * * * *

The mountains on each side of the Myette have a heavy growth of hemlock, some of the trees being four feet though. * * * *

From Jasper house to the mouth of Lesser Slave river, a distance of about 225 miles, the course of the Athabasca is to the north east, and the country through which it passes is covered with heavy timber, both spruce and poplar. There is not in the whole of this distance one hundred acres of prairie along its banks. The current after leaving the mountains is very swift, becoming slower as the distance from the mountains increases. It is probable that from Fort Assiniboine to the mountains, a distance of 175 miles, it will be navigable for steamboats, not because there are any particularly dangerous rapids or because there is not water enough, but simply because the current is so swift. The Hudson Bay Company, however, nsed to track their York boats up it from Fort Assiniboine—now abandoned—to Jasper's, without making any portages, and boats and batteux came down safely, but in some places the drop is as great as that of the roof of a house. After leaving the mountains it receives on the north side the Old Man, Baptiste and Lesser Slave rivers. The two former are very large streams rising in the mountains and flowing through a heavily timbered country. On the south side it receives the McLeod and the Pembina, both large. The McLeod flows through a country of almost solid timber and prairie, the former predominating greatly, however, along its banks. * * * * *

THERE is no agricultural land immediately along the Athabasca and very little in its neighborhood, but the fact that the main river and its tributaries drain an immense district of timbered country and that by the building of a short line of railway this timber can be made available for use on the plains, where it is in the last degree necessary for the development of that region, makes the Athabaca one of the most valuable streams in the whole of Canada.

A correspondent of the *Northwestern Lumberman* at Marquette, Michigan, writing on March 28, says.—Work in the woods is going well now. We are having the only first-class hauling that we have had all winter. The weather is clear, with hard frost. I think as many logs will be put in in March and April as all the rest of the season. Men are plenty, and wages $4 per month lower than last fall. The snow is still about four feet deep, on an average.

Rafting in Kingston.

The Kingston *News* says:—Mr. McKay, one of the Ottawa lumber kings, is at the City Hotel. It is his intention to have his logs in future floated down the Clyde, brought to Kingston on the K. & P. and rafted in this vicinity. Heretofore his logs were taken to Ottawa. His operations will give employment to a large number of men, and Kingston will be greatly benefitted by the change.

Parry Sound.

PARRY SOUND, April 7.—Extensive preparations are being made for a good season's lumber business. The Parry Sound Lumber Company's water mill will be ready to start on Monday. Their steam mill is being entirely rebuilt, and when finished will be one of the finest mills on the Georgian Bay. The Midland & North Shore Lumber Company, of Parry Harbor, are putting their mill in first-class order by the addition of new machinery and a large iron burner.

Freight Rates.

The Toronto *Globe* of April 4th says:—There is nothing said about lumber freights, but the opinion is that they will open at the same rates as those of last year, $1.25. There will not be much enquiry for lumber freights if grain should offer at 2c. and 2½c.

It was said in conversation among some vesssel-men yesterday that one of the big schooners was engaged for the round trip, from here to Duluth and back to Kingston. She will take a cargo of coal from this lake to Waubaushene, lumber from Midland to Duluth, and a load of stones back from Duluth to Kingston. The coal freight is at the rate of $1.50 per ton.

Ship Yard Machinery.

Ship timbers require the services of large machines to handle them properly. A Bath, Maine, ship-yard contains a planer supposed to be the largest in the world, It will work a piece of timber 66 feet long, five feet wide and two and one-half feet thick. The keel comes from this machine perfectly true, ready for laying. The same yard contains a big beveling saw, which turns out timber sawed to any desired angle from horizontal. Curved timber and ship-knees can be worked true to a line by it. The same engine that runs these machines also drives a bolt cutter which bites off round iron up to two inches diameter, a large and small circular saw, a machine for making tree nails, a band saw, planer, moulding machine, and a plug and wedge machine. The exhaust steam is used for steaming timber preparatory to bending it. —*The Woodworker.*

Utilizing Steam Liners.

The Glasgow correspondent of the *Timber Trades Journal* says:—From the business transacted during the past week at Clyde ports, no new feature has appeared indicative of any decided change in the market as regards prices. There is still a large supply of pitch pine on hand, and this affects values of Quebec red pine, which, especially small squares, may be said to have receded in price, and also 3rd quality deals. But as prospects of trade are good, and house-letting this spring much better than has been experienced for some years past, there is reason to believe that firm prices for wood goods will be maintained in this market as the season advances. At the same time, as regards deals, it is well known that the carrying power of our Clyde steam liners can be utilized, so that large supplies from Canada might be laid down here in the early summer.

Decay of Timber.

The ordinary life of unprotected timber structures is not more than twelve or fifteen years. Timber exposed to moisture in the presence of air, especially if in a warm place, or to alternate wetting and drying, will decay rapidly. Sap and moisture retained in timber, by painting or closing in the sticks before they are seasoned through, will cause decay of a very insidious kind, as it works in the interior, leaving an apparently sound exterior or skin, which is the layer that had an opportunity to season. Paint on unseasoned timber is, therefore, more hurtful than serviceable. Large sticks of timber dry so slowly that, before they are seasoned throughout, decay may begin, and hence pieces of small scantling are preferable to large ones. Dampness and a lack of ventilation combined will hasten decay. The best seasoned timber will not withstand the effects of exposure to the weather for much over twenty-five years.—*Lumber World.*

SOME lumber is now going from Oconto, Wisconsin, to Milwaukee over the Wisconsin & Michigan road, by way of the Stiles junction with the Eastern Grand Trunk.

LAKE of the Woods was a few years ago almost an unknown sea; now steam tugs to the number of 21 are ready to cleave its waters during the coming summer, mostly in the lumber interest.

IT is stated the Thunder Bay section of the Canadian Pacific Railway will be opened for traffic on the 1st of May. The company expect to do a very large freight business over this section during the present summer.

WITHIN a radius of 16 miles from Dayton, in the eastern part of Washington Territory, 20 saw and shingle mills will be in operation this season, the lumber output from which is placed at an average daily aggregate of 135,000 feet, all of which goes to Dayton.

THE timber land skirting the streams and lakes of northern Dakota is estimated at 600,000 acres, exclusive of the Turtle mountain region, where there are 550,000 acres. The timber is principally cottonwood, although ash, oak and elm are found in considerable quantities.

THE Marinette Barge Line Company is having a new barge built in Milwaukee, that will have a carrying capacity of 600,000 feet of lumber. It is nearly completed and has the heaviest deck-beams ever put into a vessel in Milwaukee, giving her an extraordinarily stiff backbone. Her length is 164 feet; breadth 33 feet, and depth of hold 11 feet.

NEW YORK capitalists are projecting a railroad from Oswego, N. Y., through Richland, or some town further south, into the Adirondack forest region by way of Redfield, Port Leyden and Raquette lake, to the line of the Delaware & Hudson Canal Company's road and the shore of Lake Champlain. The object is to open up this forest section for lumbering operations.

The *Northwestern Lumberman* says:—A letter from a prominent point on the Wisconsin river says that orders are coming in faster than they can be filled. The writer—a lumberman of many years' experience—says he has never seen trade more lively, especially in northern Iowa and all through Dakota, and that Wisconsin trade is also good. Stocks are light and the log crop will not be large.

IT is instanced that 16,000 feet of lumber have been cut from a single sugar pine tree in California; yet, on account of contracts made to out no logs below the lowest limbs, the tops left of trees which yielded as much lumber as stated, were more than four feet through at the base when the last log was cut. It is scientifically asserted that these trees were of giant size 800 years before the Magna Charta was signed by King John, nearly seven centuries ago.

A KINGSTON correspondent says:—Mr. Kidd has a curiosity in the shape of an old Indian pipe which was found imbedded in a huge pine log in Pittsburg, which was felled about 150 years ago. The pipe is made of soapstone, is about three inches in length, and will weigh nearly half a pound. The cavity is very small compared with the size of the head, which is shaped like a "T," one extremity being bored for the stem and the other for decoration.

THE supply of hard and decorative timber for mechanical and artistic purposes will in the near future, it is thought, be largely obtained from Brazil, where the sources of these choice and valuable materials are known to be well nigh inexhaustible. It is stated that within an area of half a square mile Agassiz counted 117 different kinds of wood, many of them admirably fitted by their hardness, tints, and beautiful grains, for the finest cabinet work. One of these, familiarly known as tortoise shell wood, and believed to be the most precious wood in the world, is found in large quantities along the tributaries of the upper Amazon, where the water can be easily used as a motive power.

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

CROWN FORESTS.

The following letter appears in the Toronto *Mail*:

SIR,—I venture to submit the following suggestions for legislation regarding our Crown forests and their preservation :—

1. All timbered lands to be properly explored by competent parties, and the quantity of each kind of timber, and the soil as to its fitness for agricultural purposes, reported upon, giving an estimate quantity of each description of timber, and where the soil is not fit for agricultural purposes at least thirty per cent. of the standing value of the timber should be charged as an up set price as a bonus. Before selling give public notice long enough before the day of sale for parties wishing to purchase to examine the limits offered for sale, so as to have competition at the time of sale; then charge another thirty. five or forty per cent. of the standing value of the timber as dues to be collected when the timber is put in market by the lumbermen. This would leave the remaining thirty-five or forty per cent. of the standing value of the timber to cover interest on the bonus paid, the annual ground rent to be charged, and timber that might be taken out of the license by actual settlers.

2. No timbered lands to be given to actual settlers unless the locality were fit for settlement, and that the lot sold or located, say 160 acres, should have a sufficient quantity of cultivatable land on it for a farmer to support himself and family by farming. Whenever sales or locations are made, no renewal of license to be given to the license-holder, providing the purchaser or locatee is in actual possession of the lot, and making improvements thereon, and gives the local agent such information as may be required at least thirty days before the day fixed for the renewal of said license, the timber to still remain the property of the Government, and be liable to future timber regulations, the same as it would be if it were only under license, and be liable to Crown dues the same as the timber that is under license. The remaining sixty or sixty-five per cent. of the timber's standing value would be an inducement to the settlers to save the timber from destruction, and the bonus paid by the lumbermen would give him an interest in the standing timber.

In case of fire breaking out and damaging the standing timber on settlers' land, the owner must not cut, nor permit any other party to cut, any timber not damaged by fire before all the timber damaged by fire has been cut, and the land on which the timber damaged by fire stood is in proper course of being cleaned up for chopping, under penalty of losing all claim to the timber on his land; and the limit-holder should be compelled to cut all the timber damaged on his limit before he cuts any timber that has not been damaged by fire, under penalty of losing his license on the limit; and in case the land is fit for farming pusposes where the timber has been killed or seriously damaged by firo, compel the limit holder to clear the land and put it under crop, and give him all the authority to the land so cleared and put under crop that an actual settler would have.

Have all kinds of lumber held in bond the same as liqour is held by the distiller, collecting the dues on sawed lumber at the mill, and on other lumber as circumstances might direct while in the hands of the owner or limit-holder, any invasion on the part of the ownor or limit-holder to act as a forfeiture.

All timber licenses should expire before the first day of June, and be renewed on or before the first day of August in each year.

By such a system the limit-holder and the settler will each have an interest in the standing timber, and therefore be likely to guard against fires, the revenue will not be materially interfered with by the settlers, and the Government will be saved the enormous expense that the Ontario Government is put to in keeping forest rangers in the lumber shanties to prevent fraud, by not giving correct returns of lumber cut, or by cutting timber on Crown lands and passing it as having been cut on patented lands.

It would also do away with the evil caused by the lumbermen having authority to cut timber for years after the settler is making improvements and living on the land, by the lumbermen coming year after year and felling timber at the settler's door, and frequently leaving the tops of trees on his cleared land for the settler to clear up. Such things have come under my notice, and I am fully satisfied that in retaliation fire has been kindled in a dry time that burnt the lumberman's shanty, and destroyed thousands of acres of valuable timber.

Yours, &c.,
P. W. FREEMAN.

Loughboro', March 26th, 1883.

INSTRUCTIONS FOR CULLERS.

The Hon. John Costigan, Minister of Inland Revenue, submits some new regulations for the government of the Supervisor of Cullers, in respect of the culling, measuring and counting off of lumber and timber. Under them, the Supervisor is required to keep in the office, a book to be called the "Cullers' Notice Book," to which book every culler shall at all official hours have access.

Each square timber culler shall, when instructions to measure any raft or transact any other duties in his capacity as culler, give notice of any expense for travelling or assistance he anticipates incurring in the transaction of such official business.

It shall be the duty of the Cashier to see that such notice book is placed before the Supervisor once on each working day, and the Supervisor shall initial each such entry and place opposite to it such remarks as he may see fit to make—indicating that such anticipated expenditure is either "approved," "considered unnecessary and disallowed," or, if in his opinion too high, "partially disallowed."

The actual disbursement thereafter made with the consent of the Supervisor thus obtained may be defrayed from time to time out of the contingencies of the Cullers' Office.

Provided that such payments shall in no case exceed one hundred and fifty dollars to any one culler during any fiscal year.

DEAL CULLERS.

After the 1st of January, 1883, the fees for "counting off" shall be collected by the Supervisor and deposited to the credit of the Hon. the Receiver-General, separately from fees for "culling or measuring."

The Supervisor shall cause the words "Counting fees" to be written across the face of each deposit receipt transmitted to the Department on account of such revenue aforesaid.

The practice of paying to each culler the sum accruing from such counting off ostensibly done by him—as heretofore followed—shall be discontinued, and instead thereof the Department of Inland Revenue is authorized to distribute from time to time the fees so received for counting off in equal shares to each of the deal cullers in the employ of the Supervisor.

STAVE CULLERS.

The fees established by tariff for culling staves, &c., shall hereafter be distributed in the following proportions :—

To the Culler - - - 80 per cent.
To the Office - - - 20 per cent.

GENERAL PROVISION.

Any regulations heretofore in force establishing or enforcing the principle of rotation of cullers are hereby cancelled in respect of any transaction in which the Supervisor shall be notified by both parties thereto that any given culler has been mutually agreed upon between them.

SPARK ARRESTERS.

A lumber manufacturer who has had 6,000,000 feet of lumber consumed at one fell swoop by means of sparks from a refuse-burner, is anxious for information regarding spark arresters, and writes this paper to that effect. The *Lumberman* has before canvassed the subject, but takes occasion to again refer to the devices used for the purpose. New-fangled notions and schemes for subduing sparks, while many have been offered, have generally been discarded in favor of first principles. The more common device is simply a wire screen or bonnet, arranged in some cases with an enlarged arm above the stack, or with a hinged joint on a flat opening at the top, the latter being inclined to clog. To obviate this a wire rope is affixed for opening and closing the trap. A patent arrangement was tried, consisting of an inclined shelf placed inside the stack in order to so regulate the upward draft that the cinders, getting out of its control, fell of their own gravity upon the shelf, from whence they were passed by a pipe to the ground. It has not come into general favor. The great secret in conquering sparks lays in the height and diameter of the aperture in the chimney. A tall stack with an aperture not too large to interfere with the draft, yet sufficiently so to stay the velocity of the heat, produces the best results. On the other hand, a small stack built upon the principle of securing an active draft is decidedly the most dangerous, since the velocity of the heated air is sufficiently great to overcome the gravity of the cinders. The stack should have a height and diameter exceeding the actual requirements of the grate surface. The sparks then rise to a height where they are less readily bouyed up, and fall into the ash pit. The heated air when confined to small compass will invariably carry sparks or heavy cinders over the top of the stacks. One way of arranging a screen at the top is in the form of a hollow cylinder without cover, four to six feet high, and with a fine enough mesh to retain the cinders or sparks within the hollow. Where this is attached to a stack of proper height and diameter it is said to word excellently. The free admission of upper air cools the sparks and detracts from the force of the heat draft, so that the sparks are extinguished.—*Northwestern Lumberman.*

HOW A MILL WAS KEPT RUNNING.

We have obtained the following interesting description of how Mr. Willet's mills at Chambly were kept running through the winter. The water was so low in the Richelieu River, when the winter set in last fall and, owing to the great severity of the winter, it froze completely over and to such thickness that there was only from 10 to 12 inches of water between the ice and the bottom of the river, and consequently backed what water there was on to Mr. Willett's water-wheels burying them in water four or five feet deep, and forcing him to shut down. It stopped the mill completely, and he finally concluded to open a channel, and sent down to the Hamilton Powder Company and obtained some three or four boxes of dualine with flat fuses, four feet long, and went to work with an electric battery. In three days he had blown open a channel about 1,000 feet long by from 10 to 12 feet, thereby lowering the back water at the wheels by some two and a half to three feet. The mills were started and have since been running with good speed. This dualine is done up in half pound packages, and two or three of them are attached to the flat fuse and then the fuse to the battery and it blows the ice all to pieces, and if there is water enough to carry it off it will make the channel and lower the water. The ice disposed of in this case was from two and a half to four and a half feet thick. Mr. Willett writing to a friend in this city says he believes it would be effective in preventing a flood in Montreal in case of any sudden thaw. If the material were furnished he believes he could blow all the ice out of the St. Lawrence and save the city from a flood.—*Montreal Witness.*

OTTAWA NOTES.

The *Monetary Review* says :—The staple industry at Ottawa, the lumber trade, is in the meantime quiet. Purchasers are endeavouring to buy at a reduced price, but the owners of timber and sawn lumber are holding on and will only sell at the old figure. What business has been done lately is therefore only in jobbing lots. The outlook for the coming season is regarded as bright. Those who are now daily arriving from the shanties in the woods report that they have experienced one of the best seasons for lumbering operations that has been vouchsafed for a long time. The weather, although a trifle cold, was favorable for the work, and the sleighing throughout was excellent. This, combined with the almost unprecedented length of the winter, enabled the parties engaged to prepare a larger number of logs for the coming drive than they have been able to do in one season for many years past.

A HEARTY RECOMMENDATION'—Jacob A. Empey, of Cannamore, states that he has taken Burdock Blood Bitters with great benefit in a lingering complaint, and adds that he would gladly recommend it to all.

No person can enjoy health while suffering Constipation of the Bowels. Harsh purgatives always do harm. Burdock Blood Bitters is Natures own Cathartic; it unlocks the secretions regulates, purifies and strengthens the system.

111

ON THE KENNEBEC, MAINE.

The Kennebec *Journal* says :—The past winter for lumbering operations has been one of the best ever known in the annals of the business in Maine. Continuous cold weather has prevailed with very little rain and no thaws to speak of. There has also been an abundance of snow, which falling the beginning of the season has remained on the ground and even now there is sufficient for operating and the lumbering crews are still in the woods. Lumbering on the Kennebec and its tributaries has been very successful during the season now drawing to a close. Something like 110,000,000 feet of logs has been cut and will be floated down the river the ensuing summer. The Hon. John Manchester Haynes, of this city, has operated very extensively. His cut will amount to 12,000,000 feet. He has 12 different camps which will average from 25 to 30 men each. Three are located at Brassua Lake ; one at Parlin pond ; two at Coldstream ; three on south branch of Dead River. Bodwell & Co. will cut three million feet on Dead River ; M. G. Shaw, 3,000,000, Dead River ; Snow & Co., 4,000,000, Enchanted stream ; Townsend & Abbott, 1,000,000, Cold stream ; Clark & Weston, 1.000,000, Eaton pond ; Bradstreets, 1,000,000, Moose River, 3,000,000, Moxie stream ; George Snow, 2,000,000, East Branch ; Eveleth, 2,000,000, Black Brook ; Lawrence Bros., 4,000,000, Brassau ; McPheters, 1,000,000, Black brook ; E. & J. Lawrence, 6,000,000, Moose river ; Elias Milliken, 3,000,000, Moosehead lake and Dead river. There is also a large number of smaller operators whose several cuts will make up the total. The lumbermen will be coming out of the woods very soon now, as the present favorable weather cannot continue much longer. The building of the magnificent dam at Indian Rock by the Kennebec Log Driving Co. will be completed very shortly, as 200 men will be put on the first of April. The structure will cost not less than $12,000. Its object is to facilitate the driving of the logs received from the lake through to the Forks. Messrs. Miliken & Sturgis, as we have before stated, have taken the contract to drive the logs and will employ a crew of about 200 men. The driving season lasts from about the 20th of May to the last of August. Ice does not generally break up in Moosehead Lake until about the 20th of May. The prospect is that there will be a good market for lumber in the future, and the amount cut the past season will find a ready sale. There is not a large stock held on the river at the present time.

DAKOTA BUSINESS.

The growth of the lumber business in Dakota during the next five years must be enormous. The territory comprises an area about as large as Kansas and Nebraska combined, and probably a larger proportion of Dakota is capable of profitable farming than that of Kansas and Nebraska. Certainly all that part of the territory east of the Missouri will be thickly settled by an agricultural population. Though within the last five years settlement has been going on in the middle and the northern portions of the territory, but little farm improvement in the way of buildings has been done. In the Red river valley and along the Northern Pacific road west of Fargo the lumber trade began as late as 1877, and the farmers did not begin to put up substantial buildings till 1880. And yet so rapid has been the increase in the lumber trade of that section, that the amount handled at Fargo during 1881 reached 25,000,000 feet. All the new country along the Northern Pacific, the Minneapolis & Manitoba, the newly opening Devil's lake and Turtle mountain region, which is to be immediately penetrated by railroad ; the Fargo & Southwestern road, now under construction ; the Northwestern to the Black Hills—all these vast regions, now rapidly filling up with new settlers, have yet to be supplied with lumber to build the first permanent houses in town and country. The amount of lumber that will be required for this purposes is simply incalculable. And we must reflect that the supply is not to be furnished twenty years from now—it is not a work of the far off future ; it must be done within the next two, three or five years. The proposition is simply startling. And after the first building improvement has taken place, after sufficient primitive house room has provided for the wants of the earlier settlement, then there will follow the building of large barns and dwellings on farms, and more substantial structures in the towns and cities ; the same process having been witnessed in Illinois, Iowa, Wisconsin, and that is beginning in Kansas and Nebraska. The Dakota trade must be counted on as a powerful factor in the future of the Northwestern lumber business.—*Northwestern Lumberman.*

POSTS SET "TOP END DOWN."

It is firmly believed by many persons that posts set in the ground in a position the "reverse" of which they stood while growing in the tree, will last much longer than when set "top end up." In the spring of 1879 I selected seasoned sticks, three feet long. These were split in two, and then cut in two crosswise, making four pieces of each. One set was placed in a well-drained sand, the other in clay soil. In every case two pieces were set side by side, with earth between, one as it stood in the tree, the other reversed. I tried thirteen kinds of timber. Some of these were young wood with the bark on. All contained some heartwood. Those set in the sand were examined in the autumn of 1881. In case of the beach, sugar maple, ironwood, black ash and black cherry, the piece reversed or placed "top end down," was somewhat decayed. In case of red maple, American elm, butternut and red elm, the piece set "bottom end down" was a trifle the most decayed. In case of basswood, white ash, white oak, and blue ash, there was no perceptible difference. In autumn of 1882, the posts set in clay soil were examined. In case of the red maple, sugar maple, American elm, basswood, butternut, red elm, the pieces set "top end down" were most decayed. In case of ironwood, white oak, blue ash, there was no perceptible difference.

I infer that where one piece decayed more than the other it was caused by some trifling difference in the sticks. The freshly sawed ends in each case were placed uppermost, and came an inch or two above the ground.

In some cases one-half of a stick (one piece certainly the reverse of the other) lasted considably better than its other half. As will be seen, it was sometimes the "top end down" which lasted better, sometimes the "bottom end down," and in some cases there was no difference in durability.—*Cincinnati Trade List.*

THE WILLOW.

Among the various species of trees whose value is overlooked in this country, especially when the soil and climate everywhere are favorable to their cultivation is the willow, which in England is greatly esteemed for many purposes. It is claimed that we import annually $5,000,000 worth, when we can as well raise it successfully in any part of the country. This is demonstrated by the rapidity with which it springs up after being planted by farmers for fence purposes, attaining in two or three years large proportions. In the Eastern States the willow may be seen almost about the grounds of every farm house, but its chief service is to protect the buildings from severe storms, and in summer time to afford a refuge of shade from the intense heat of the sun. The Hon. Jesse Fell, of Illinois, says :—"Were I called upon to designate one tree, which, more than all others, I would recommend for general planting, I would say unhesitatingly it should be the willow." It has been used extensively to strengthen dams, growing very rapidly with far-reaching roots that give strength to the soil to keep it in place.—*Lumber Trade Journal.*

A RIVAL TO THE NORTH WEST.

If we are to believe *Le Nord*, a paper which derives its title from its location, there is in the neighborhood of Lake Temiscamingue, a country of open prairies, excellent soil, abundant timber in pieces, and silver and lead mines of "incredible richness." This region is well watered, and the climate is mild enough to ripen some kinds of grapes. Even where the land is not open prairie, there are miles of land over which fire has swept, cutting down cedars of unusual size. The roots of the cedar are burnt out ; but much of the fallen cedar is well preserved. On some of these spots, a child, we are told, could clear an acre in a week. This country is not distant, but it is admitted to be not easily accessible.

This region is near the great lumbering field of the north, where the farmer gets $50 per ton for his hay, $1 per bushel for oats, $1.50 for peas, and $2.50 for wheat. These prices will not of course last for ever ; for when the lumbering is done prices must come down to the average level.

The Temiscamingue region is a mere speck compared with the great North-West ; and if all that is said of it by *Le Nord* be true, its colonization will not have any appreciable effect on the future fortunes of the North-West. It is possible that many French Canadians may prefer it to the country beyond the Lake of the Woods ; but is not probable that emigration from Ontario will be diverted from the course it now inclines to take by the temptation of the Temiscamingue country.

Already *Le Nord* calls for a railway to Temiscamingue, and the Local Government of Quebec will doubtless be importuned to build or aid in building it. At present, however, that Government is in no position to enter upon new undertakings of this kind and it would difficult to say when it will be.—*Monetary Times.*

The Winnipeg *Commercial* says :—R. J. Bell, of Morris, has ordered a complete outfit for a saw-mill which he proposes establishing at Calgary.

The Brandon correspondent of the Winnipeg *Commercial* says :—Building operations are going on briskly, and large quantities of lumber are daily arriving.

The Western Union Telegraph Company has estimated the durability of telegraph poles as follows : Cedar, 16 years ; chestnut, 13 ; juniper, 13 ; spruce, 7 years. Cedar, chestnut and spruce are used in the Northern states ; juniper and cypress in the Southern states, and redwood in California. Poles cut in the summer will not last as long as those cut in the winter by five years.

Seven inches from the outside of a log in a Pennsylvania mill, the saw passed through a walnut which was imbedded in the solid wood. The shell and kernel of the nut were sound. The growth of the tree shows that the nut is at least fifty years old.

The 'longshoremen of Oswego have met and adopted the following schedule of rates for the opening of the season :—Canada lumber, 20c. ; Canada lumber in vessels and barges of 300 M. capacity, 25c. ; cedar ties, 1½c. ; hemlock and all other ties, 2c. ; shingles, 4c. ; lath, 5c. ; posts per cord, 30c. ; stave bolts per cord, 25c. ; timber per M. board measure, 30c. ; headings 15c. ; telegraph poles a piece, 5c. ; hour work in vessels, 60c. ; hour work in yards, 25c. ; hop poles per M., $3 ; ash and all hard wood, 35c.

The *Lumber Trade Journal* says :—A large portion of the lumber supply comes from Michigan, and Muskegon cuts more lumber than any other city in the world, and so is called the sawdust city. It is between Detroit and Chicago, being 196 miles from the former, and 192 miles from the latter city, and is on Lake Muskegon, which is about six miles long and two miles wide, and into which empties the longest river in the state, penetrating for hundreds of miles into the best pineries in the state. The lake never freezes up, on account of the rapid current into Lake Michigan. There are railroads which connect Muskegon with all the main lines east to the seaboard, and west by water across the lake to Chicago, so it is admirably situated for a shipping point.

Letter from Member of Congress.

HOUSE OF REPRESENTASIVES,
Washington, D.C., Feb. 19, '82.

GENTLEMEN,—Inclosed find $1. and will you send me some of N. H. Down's Vegetable Balsomic Elixir by express. I have a bad cold, as has almost every one else here, but cannot find the Elixir, which I used frequently at home and consider a most valuable medicine ; in fact, the very best remedy for a cold that I ever used.

Very truly yours, WILLIAM W. GROUT.

The Minnedosa correspondent of the Winnipeg *Free Press* says :—Mr. Alexander Cameron, sr., is talking of moving his saw mill from Rolling River to Minnedosa. Mr. Cameron has seen what a great demand there will be for lumber this spring.

The *Wood-Worker* says that saw-mill men should cut lumber full thickness and saw both ends off smooth. It adds much to the appearance by butting off both ends, and the additional cost will be saved in freight. Buyers will give better inspection, if not better prices.

MAIL CONTRACT.

Sealed Tenders, addressed to the Postmaster General, will be received at Ottawa until noon, on FRIDAY, 11TH MAY, for the conveyance of Her Majesty's Mails, on proposed Contracts for four years, forty two times per week each way, between

Peterborough and Midland Railway Station,

and three times per week between

WARSAW AND PETERBOROUGH,

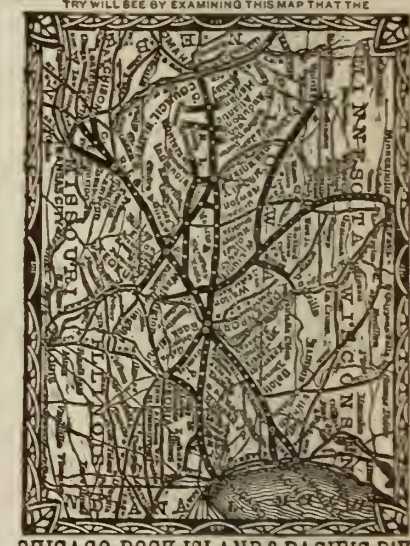
from the 1st July next. The conveyence to be made in a Vehicle. Printed notices containing further information as to conditions of proposed Contracts may be seen, and blank forms of Tender may be obtained at the Post Offices of Peterborough and Warsaw, and also at this office.

Post Office Inspector's office,
Kingston, 30th March, 1883. GILBERT GRIFFIN,
2d80-1w14-2l8 Post Office Inspector.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

A MAN

WHO IS UNACQUAINTED WITH THE GEOGRAPHY OF THIS COUNTRY WILL SEE BY EXAMINING THIS MAP THAT THE



CHICAGO, ROCK ISLAND & PACIFIC R'Y

By the central position of its line, connects the East and the West by the shortest route, and carries passengers, without change of cars, between Chicago and Kansas City, Council Bluffs, Leavenworth, Atchison, Minneapolis and St. Paul. It connects in Union Depots with all the principal lines of road between the Atlantic and the Pacific Oceans. Its equipment is unrivaled and magnificent, being composed of Most Comfortable and Beautiful Day Coaches, Magnificent Horton Reclining Chair Cars, Pullman's Prettiest Palace Sleeping Cars, and the Best Line of Dining Cars in the World. Three Trains between Chicago and Missouri River Points. Two Trains between Chicago and Minneapolis and St. Paul, via the Famous

"ALBERT LEA ROUTE."

A New and Direct Line, via Seneca and Kankakee, has recently been opened between Richmond, Norfolk, Newport News, Chattanooga, Atlanta, Augusta, Nashville, Louisville, Lexington, Cincinnati, Indianapolis and Lafayette, and Omaha, Minneapolis and St. Paul and intermediate points.

All Through Passengers Travel on Fast Express Trains.

Tickets for sale at all principal Ticket Offices in the United States and Canada.

Baggage checked through and rates of fare always as low as competitors that offer less advantages.

LUMBERMEN'S STATIONERY.

We will supply anything in the line of BLANKS or STATIONERY for Lumber Shanties and Offices at City Prices.

Shanty Settlements
Shanty Orders
Shanty Receipts
Shanty Time Books
Shanty Log Books
Shanty Reports
Shanty Ledgers
Shanty Cash Books
Shanty Way Bills
Drive Books

Office Letterheads
Office Noteheads
Office Envelopes
Office Cards
Office Notes
Office Drafts
Office Orders
Office Receipts
Office Blank Books
Office Ship Account Books

And everything necessary to a complete office outfit.

All PRINTING done in the Highest Style of the Art, and at Lowest Living Prices.

BOOK-BINDING of every Description got up in a very Neat and Superior manner.

Account Books Ruled and Bound to any desired Pattern.

For Schedule of Prices address, describing the kind and quality of work desired,

TOKER & Co.,

"THE CANADA LUMBERMAN,"

PETERBOROUGH, ONTARIO.

EMERY WHEELS FOR SAW GUMMING.

EX INUTILI UTILITAS
TRADE TANITE MARK

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

SUBSCRIPTION $2.00 PER ANNUM.

VOL. 3. PETERBOROUGH, ONT., MAY 1, 1883. NO. 9.

FRIDRICKSON BROS. & Co., Selkirk, Man., have got out 30,000 logs the past season, at Icelandic, on White Mud river, and boats are now being made ready for bringing them to Selkirk. The company is having a lumber barge built, 110 feet long.

THE *Lumber World* says:—It is generally supposed that California redwood is a very durable timber, but a gentleman who has had much experience with it says this is a mistake, and that redwood, when exposed to alternations of moisture and dampness, will not last more than from three to five years before being completely rotted. When placed under water so as to be completely excluded from air, it will last for an indefinite period. Planks thus situated have been found perfectly sound after twenty-five years.

A DESPATCH from Quebec of April 17th, says: The high water this spring is likely to assist lumbermen very materially in getting out their logs. Mr. J. B. Charlson, who has some 50,000 logs cut in the woods near Windsor mills, received a telegram yesterday, informing him that the river was overflowing its banks, and telling him to bring up men. He accordingly left at once, taking up some forty men for the drive. The weather is quite close and warm to-day, and the snow is rapidly melting.

THE St. John, N. B., *News* says:—Last January, when Mr. Gibson took stock of his lumber at the various mills in St. John, he had a total quantity available for shipment of 40,000,000 feet. Besides that he had 10,000,000 feet of logs frozen up in the ice on the Nashwask River. This winter Mr. Gibson's cut, as estimated previously by the *News*, will reach a total of 26,000,000 feet. Add to this 10,000,000 feet cut on Grand Lake waters by Messrs. Tayley, which are under contract to the nabob of the Nashwask, and the total quantity of lumber, exclusive of possible purchases, that Mr. Gibson will control this year amounts to 86,000,000 feet.

THE Minnedosa *Tribune*, discussing the lumbering operations in the Riding Mountains, has the following interesting statement:—Forty men and fifteen teams were employed in Jermyn & Bolton's shanty, and with this force nearly 28,000 logs were got to the banks ready for the drive. The logs had to be drawn about five miles and a half. The cut of the different firms is estimated as follows:—Madden & McNee, for Major Douglas, of Minnedosa, 14,000 logs; Hudson Bay Co., Strathclair, 14,000; Whimster & Kyle, Strathclair, 14,000; Cameron & Sons, Rolling River, 4,000. All these firms are actively preparing for the drive, and there will be lively times on the river in a week or two.

APPRECIATED.

To a communication enclosing his subscription for the CANADA LUMBERMAN, and the name of a new subscriber, Mr. Silas R. Lantz, of Paradise, Annapolis County, N. S., appends the following appreciative paragraph:—"Before closing I would like to express my satisfaction in reading your valuable paper. As a lumber paper its value is untold, the information in its columns being very valuable to persons in the business."

THE PEACE RIVER.

We take the following extracts from an account of the Peace River published by the Edmonton *Bulletin*:—

"From Rocky Mountain portage to the rapids, 30 miles below Fort Vermillion, a distance of 459 miles, there is an unbroken stretch of navigable water. The current is strong but not swift, and the volume of water is twice as great as in the Saskatchewan at Edmonton. The river has a stony bottom and there are a few islands, but no sand bars. The banks are very high from the portage to the mouth of the Smoky river. Many large and small streams fall in on both sides of the main river, which having a considerable fall near their mouths would give excellent water power. The south bank is heavily timbered all the way from the mountains down, but the north bank is open prairie. * * * *

The banks of the river in the lower part of its course are low and heavily timbered, as is the country on both sides. The total length of the Peace from the head of the parsnip to the junction with the Athabasca is about 850 miles.

The country along the Parsnip and Finlay branches of the Peace is heavily timbered with spruce, hemlock, poplar and birch, with some pine, cedar and fir. The climate is damp and the snow fall very great—sometimes seven feet at Fort McLoed. On the north side of the river, east of the mountains as far as the mouth of Smoky river, the country is mixed prairie and timber, with the prairie predominating for from fifty to one hundred miles back from the river. The land is high, dry and rolling, well watered by numerous creeks. The soil is a sandy loam, and grass grows luxuriantly. So much so that upland hay can be cut. There are many fresh water ponds and lakes, and no alkali is visible anywhere. One of these ponds 20 miles north of the Mountain Portage, is a round basin of perfectly clear water, without inlet or outlet, and stocked with three varieties of trout, which can be caught at all seasons of the year. The timber is generally much larger and of better quality than what grows at Edmonton, the poplar being larger and the spruce freer from knots. Between the clumps of timber the prairie is clean and would be easy to break. There are very few hay swamps, especially near the river. Fort Dunvegon is situated on the river about forty miles above the forks by land and is in the heart of this prairie country. The prairie extends down the river to Fort Vermillion, but does not come quite to the river bank below the Forks. The soil is richer in this lower part, but it is not quite so high or dry as that around Dunvegan. Below Vermillion the land is low and entirely covered with timber.

On the south side the country is well timbered for about 80 miles below the portage. Below that point to the mouth of Smoky river the bank is heavily timbered, but the back country is only partially so, and after a distance of about 20 miles from the river is reached the Beaver Plain commences, which extends southward nearly to the Jasper House, takes in the upper part of Smoky river on the east and extends west to the mountains. This plain has the same general characteristics as that north of the river, except that it has less timber, but it has wood on all sides of it. Below the mouth of Smoky river on the east and south side the country is covered with timber. The soil in the valley of the river is principally "made" soil and is very rich."

QUARTER-SAWED LUMBER.

The *Northwestern Lumberman* says:—There is no lumber that will shrink so little and wear so long as quarter-sawed. This process of sawing is particularly applicable to yellow pine flooring, as such flooring is generally laid where it is subjected to heavy wear. A bastard-sawed board, no matter from what kind of timber it is cut, will wear rough, and sliver, if in constant use for flooring or driveways. It would be impossible to conceive of a harder, more durable floor than yellow pine would make it it were quartered. The pitch it contains would give it an advantage over oak, ash or maple in a point of durability. A few of the southern mill men are beginning to understand the merits of such flooring, and are selecting the few quartered boards that every log sawed the old-fashioned way invariably has, and putting them in a grade by themselves. It is a bad way of doing, for the balance of the flooring is depreciated in value, and in fact sometimes almost worthless, for no man who is acquainted with its defects would think of making a floor of it. It might answer for a floor that is to be kept carpeted, but usually such a floor is made of softer and cheaper wood. The expense of quarter-sawing would be considerably in excess of the usual way of manufacture, but the flooring would be richly worth the difference. Quartered oak in the large markets is worth, on an average, $10 per thousand more than clear oak sawed bastard, and there ought to be nearly that difference between the two kinds of yellow pine flooring. A log, if quarter-sawed, does not yield as much lumber as if sawed the other way, and sawing it that way is a slower job. Quartered flooring ought to be one of the productions of the southern mills. Builders should not object to paying a third more for it, when they know its beauty and durability are more than doubled, as compared with bastard, and every intelligent builder ought known that such is the fact.

WOODEN BUILDINGS.

The fact that building promises to be lively in the villages and the small cities is an indication that a large amount of lumber will be consumed. The construction of a good sized frame building often calls for more lumber than a large building in a city. Frequently in the latter there is not much wood used, except for floors, and for sash and doors and their casings. There is a disposition in large cities to make the buildings as nearly fire-proof as possible, and in order to do this as little wood as possible must be used. Iron must take the place of wooden joist, wire lath the place of wooden lath, and wood crowded out wherever practicable. As it is somewhat cheaper to build of wood than of brick, and as a wooden house, in appearance, suits the taste of many as well, it is a rule that wood is used where fire limits are not known. The tendency to build of other material than wood will grow in the large cities as the fire limits are gradually being extended, and capitalists come to fear the fire-fiend more and more. Architects are getting to understand the fact that fires in cities need not be of usual occurrence. Brick, stone, iron, terra cotta and glass will not suffer from fire unless some inflammable material is used with them.—*Northwestern Lumberman.*

CALIFORNIAN REDWOOD.

Not only has the traffic in our timber greatly increased of late, but that in the redwood of northern California has increased likewise. In this connection the *Times-Telephone* of Eureka says that the redwood lumber trade of last year makes a most flattering showing as compared with former years, and particularly so in connection with the foreign demand. The books of the Redwood Lumbermen's Association of the Pacific coast show that during the year 1882 the receipts of redwood lumber at the port of San Francisco reached the unusual amount of 97,265,434 feet, and the shipments to foreign and domestic ports during the year amounted to 55,242,305 feet, making the total of 152,517,738 feet manufactured and put into home and foreign markets during the year. The total product for shipment during the year 1881 was 130,465,714 feet, showing an increase in favor of the year 1882 of 22,052,024 feet. Of this increased shipment, 2,000,000 feet were received at the port of San Francisco, and 20,000,000 feet went to other domestic and foreign ports.—*Lumberman's Gazette.*

BOSTON NOTES.

The Boston correspondent of the *Northwestern Lumberman* says :—As to the local trade, it seems but a repetition of previous letters, to one who watches the market carefully. However, it is evident that trade is improving. This assertion may not apply as particularly to city trade as to suburban business. A great deal of building is now under way in many of the towns and cities within a radius of 50 miles of Boston. To be sure, a certain portion of the supply is forwarded from here, but a large portion, although sold by our wholesale men, is shipped direct.

The amount of lumber now to be found at the different railroads is not as large as the corresponding month last year, and the proportion of this that is desirable lumber is quite small. As usual, this stock is largely hardwood—a few cars of pine, but a very poor assortment. Now and then a person will run across a car of good lumber, but it is not apt to remain long ; for, as I have frequently written, good lots sell quite readily in any state of trade. As to prices, I observe no material change. Buyers, as a rule, would try and make it out that they were being offered lots at reduced figures, while the sellers are very firm in their prices, and talk confidently of an early advance on certain grades. I find it is the opinion of certain dealers, whom I believe to be good judges, that dry white pine, the upper grades, will advance slightly, and hold firm until the new cut is in shipping order. Certainly, dry stocks are very scarce at the West, and those of our dealers who have control of such stocks are not liable to dispose of them foolishly.

Yellow pine is holding very firm, and our wholesalers are doing a good business in hardwoods. Ash is selling fairly, and at present prices at which it is held at the mills, it must surely advance. The present supply is quite narrow. There is a good sale for ash that will average 12 to 14 inches, but not many such lots are offered. Oak, cherry and poplar are each having a good sale. There is no noticeable scarcity of either of these. Walnut is selling very fairly, although almost entirely to the manufacturing trade. I hear of sales as low as $80, from that to $90, and for heavy walnut up to $100. Culls sell from $35 to $40 ; a good grade of dry, usually at the latter figure, although the sale of this grade is not nearly as large as it was a few years since, manufacturers preferring better lumber at a higher price. All things considered, the dealers unanimously report trade as very satisfactory for the season, and with a probable scarcity of good lumber, and indications of a heavy trade, the prospects are that prices will remain firm, and dealers will thus have a firm basis on which to reckon their profits.

The spruce men have made a move, and held a meeting recently at Portland, Me., agreeing to advance prices $1 per thousand. If they hold to their agreement, it will undoubtedly help the trade, as past prices have certainly paid little, if any, profit to the producers, and as large risks are taken by many of the manufacturers it is not unreasonable that they should receive a better profit on their investments, than they have obtained the past two or three years.

MONTREAL NOTES.

The *Gazette* of April 19th says :—An improved local demand has been experienced at the yards for both soft and hard woods at steady prices, although some kinds of hard have a stiffening tendency. A fair enquiry continues on American account, but we do not hear of important transactions. Pine, ash, walnut and cherry are the principal kinds inquired for. Dealers look forward to a good trade with Winnipeg, notwithstanding the fact that shipments of logs and sawn lumber are finding their way thither from Minnesota. Laths in this market are firm at the late advance. It is too early to say much about the shipment of deals to Great Britain or of lumber to South America, although we hear steamer room for deals has been offered at 60s. Liverpool.

THE *Witness* of April 19, says :—The lumbering operations of the past winter have been the most extensive, probably, in the history of the Dominion, and the high water which prevails, and is likely to prevail, in all the rivers and streams throughout the lumber regions will enable the lumbermen to forward their logs and timber to where it can be marketed in good time. Although there is every prospect of an unusually large supply, prices are firm and have advanced in some cases, owing to the active demand from American markets, which is likely to continue throughout the season. There is also a very large local demand throughout the country, as the farmers, who have had several good seasons in succession, are about making more or less extensive improvements on their homesteads, especially in the construction of larger and more convenient barns for storing their produce and housing their live stock. There is a fair amount of new buildings in prospect here this season, and lumber dealers are expecting a profitable trade. The shipments of lumber to South America are likely to be large, but it is probable that the demand from Britain will be moderate. The following are the retail prices of lumber per 1,000 feet in the yards in this city—Pine—clear lumber, $35 to $45 ; 1st quality, $30 to $35 ; 2nd quality, $22 to £25 ; 3rd quality, $14 to $16 ; culls, $10 to 12. Long pine lumber for building purpose, $20 to $25 per M ; long hemlock lumber for building purposes, $16 to $18 do ; spruce lumber, $10 to $12 do ; hemlock lumber, $9 to $10 do ; shingles, $2 to $3.50 per M. ; laths, $2.25 to $2.50 do.

The price of laths is now double the amount they were two years ago. Dressed lumber.—Common boards, $16 to $18 per M. ; one and a quarter inch roofing, $16 to $18 do ; 1¼ inch flooring, $20 to $22 do. ; 1½ inch flooring, $24 to $30 do. ; 2 inch flooring, $30 to $35 do. Doors, windows, blinds, &c.—Doors, 7 ft. by 3ft., 2 inches thick, with flush moulding, $3.50 ; the same size with raised mouldings $3.90 ; doors 6 ft. 8 in. by 2 ft. 8 in. ; 1½ inches thick, $2.50 ; doors 6 ft. 6 in. by 2 ft. 6 in., 1¼ inches thick, $2.50.

French windows, six lights, size of glass 14 by 18 inches, $2.50 ; blinds for the above size, $2.85 ; French windows, six lights, size of glass 14 by 16 inches, $2.35 ; blinds for same, $2.60 ; French windows, six lights, glass 12 by 14 inches, $2.10 ; blinds for same, $2.25 ; English windows, twelve lights, size of glass 10 by 12 inches, $2.30 ; blinds for same $2.50 ; English windows, twelve lights, glass 12 by 18 inches, $3 ; blinds for same, $3.65 ; sashes, twelve lights, glass 10 by 12 inches, 90c. ; do. glass 12 by 18 inches, $1.25.

Hardwood lumber.—There is good local demand for most kinds of hardwood and the prices are firm, but generally about the same rate as last season. The following are the prices, per 1,000 feet :—Black walnut, $60 to $100 ; cherry, $60 to $80 : oak and hickory, $50 to $55 ; butternut, $35 to $40 ; maple and rock elm, $30 to $35 ; birch and beech, $25 to $30 ; ash, $15 to $25 ; elm, $16 to $18 ; basswood, $12 to $16.

QUEBEC NOTES.

Messrs. D. & J. Maguire, of this city, have contracted for a delivery at the River Platte the coming season of about five million feet of spruce lumber, all of which will be shipped from Montreal and Three Rivers. The firm also intends shipping several cargoes of red pine deals and staves to the Cape of Good Hope.

THE high water this spring is likely to assist lumbermen very materially in getting out their logs. Mr. S. B. Charleson, who has some 50,000 logs cut in the woods at Windsor Mills, received a telegram on Monday, April 16th, informing him that the river was overflowing its banks and telling him to bring up men. He according left Quebec at once, taking up some forty men with him for the drive.

Timber dealers have made a number of contracts with tug owners at Quebec for towing their rafts to maket this season. The rates are reported as about the same as usual.

A Montreal letter says :—We have had very few visits from Quebec timber merchants so far, which is rather an unfavorable indication, however, as there are considerable heavy stocks ahead in Quebec, sufficient to keep them going until the new timber reaches market, not likely before the middle of July. It is possible that their absence does not signify a dull season, although no sales of timber on the snow are reported. In sawed lumber there is very little being done. If any contracts for the season's sawing have been made, neither the names of the parties contracting, nor terms, have transpired. Although there seems to be a brisk demand for saw logs ; one gentleman sold all he had made, some 25,000 pieces, the other evening, and had scarcely concluded the sale when another mill man approached him with a view to buying, and would probably have given a higher figure.

DAKOTA BUSINESS.

The wood-working interests of Dakota and other northwestern states and territories are being developed in a very satisfactory if not rapid manner. A Minneapolis paper of recent date says : "The manufacturer of cheap furniture in available towns in North Dakota has a profitable occupation before him. There is an abundance of room for men of capital who are willing to come and engage in this business. This class of work has been begun in some places in a small way, and will doubtless grow enormously in the near future. But Grand Forks, Fargo, Valley City, Jamestown, Bismarck and Mandan offer excellent advantages to the manufacturer also. A freight car load of furniture from the nearst available point costs for freight alone about $85 to Fargo or Grand Forks, and of course a greater sum to places further along the line. The cost of the freight on a carload of lumber from Minnesota to Fargo would be about $25. Grand Forks can obtain it at a less cost than this. It is estimated by competent authorities that one carload of lumber can be made up into at least three carloads of furniture. So here the North Dakota manufacturer has a bonus to start with of $255 minus $25—that is $230 on three carloads of furniture. In other words he is "protected" to the extent of over $75 a carload in Fargo and Grand Forks and to a greater extent the further west he gets. The cost of fuel in this part of the country for running machinery is not much in excess of what it is in the towns of Ohio or Michigan. Anyhow, in most wood-working establishments the waste will run the engine. Sash, door and blind makers, too, will find an abundance of work awaiting them in North Dakota. Thousands and tens of thousands of houses are going to be built within the next twelve months or so, and every house must have doors, while vast numbers of them will require sashes and blinds also. Where are these articles to be obtained? The supply of North Dakota sash, door and blind mills can not possibly keep pace with the demand. The establishment of new mills will result in profitable work for employers and men and convenience to builders of houses."—*The Wood-Worker.*

NIPISSING TIMBER.

A correspondent of the Montreal *Gazette* writes as follows :—The first shipment of square timber from Nipissing, went down the line to Mattawa on the 3rd of April. It was taken out by Mr. Moore, I understand, and was very nice timber. They say Mr. Moore has a splendid limit or limits in this Nipissing country, and no doubt his timber will be No. 1, as he employs none but first-class workmen, and he experiences no difficulty in getting such men, as he is held in high esteem by all his employees for the straightforward and manly way he does his business. Messrs. Barnet & Mackie are also sending down square timber by this line. They are old and experienced lumbermen too, and as the place from which they are taking their timber has never been cut over before this season, they must no doubt have some very fine square timber. There are a number of other firms operating in the same vicinity, some of them cutting logs, but nearly all making more or less square timber. One thing is to be noticed that the governments of both the provinces of Quebec and Ontario seem slow to move in, and that is the proper protection of the forests from fire by trappers and settlers. In fact, the only way that this can be remedied is by appointing capable men for the work with power to cause at any time the arrest of any person or persons whom they have reasonable cause to suspect to be the cause of any unnecessary damaging fire.

There is a steamboat on Lake Nippissing which is a great convenience to the lumbermen. The south side of the lake is well settled, in fact nearly all the available good land is taken up. On the north side the land is comparatively worthless in an agricultural point of view. There are a number of Indians still on the north side of the lake, but as is usual where the white man advances the red man recedes, and as many are considerably off color it is quite evident they have mixed with the white race years ago.

It is rumored that there are several lumbermen contemplating the erecting of saw mills. No doubt the C. P. R. Company will find it to be to their interest to be as liberal as possible in freight rates and encourage this trade. Trains on the Canadian Pacific are now running as far west as Sturgeon River, and the road is well under construction for some distance beyond. It is being rapidly built. There is a superior class of workmen on this part of the line. The most of them are shantymen and farmers' sons—a very respectable class. There are scarcely any of the old hardened navvies to be met with here. They have been tried, but were evidently a failure, and their disappearance from here nobody regrets. Teams are now to be seen daily returning home after a hard winter's work. Those teams that work in the lumber woods are chiefly owned by farmers, who, not having sufficient work to employ them at home, start off to the lumber woods in the early part of the season. They are paid this season from $1.50 to $2 per diem and found in board. The wolves are very numerous. The carcasses of small deer, or what remains of them, are frequently to be met with that have been hunted down and killed. In my next letter I will give you a description of the country above Pembroke, westward, &c.

The Toronto *Mail* of April 20, says :—Burton Brothers are making extensive preparations for rafting square timber down to Montreal. Fourteen car-loads were run into the water between piers 3 and 4 at the Northern wharf yesterday. About the same number were floated on Tuesday, and it is likely that the first raft will slip as soon as the way is clear down the canal.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on March 31st, 1882 and 1883, and also the Consumption for the month of March, 1882 and 1883 :—

	Stock, Mar. 31st. 1883.	*Stock, Mar. 31st. 1882.*	*Consumption for the month of Mar. 1882.*	*Consumption for the month of Mar.*
Quebec Square Pine	161,000 ft.	119,000 ft.	65,000 ft.	80,000 ft.

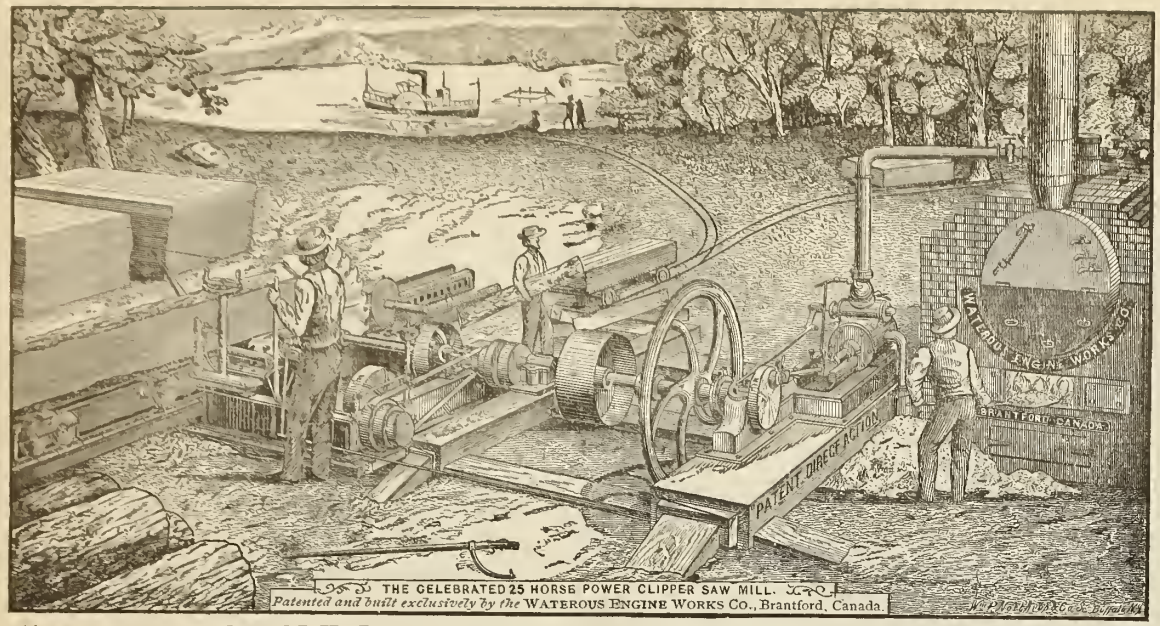
Semi-Portable and Portable Direct Action and Belted Saw Mills!

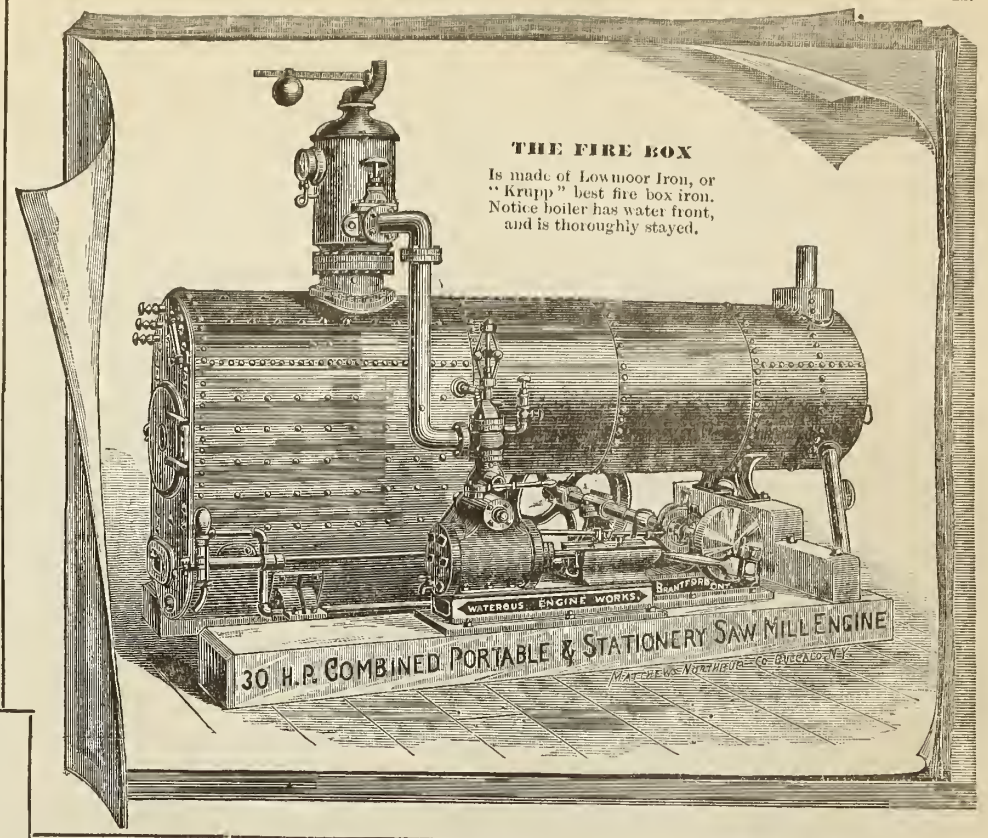
TEN DIFFERENT SIZES.



THE CELEBRATED 25 HORSE POWER CLIPPER SAW MILL.
Patented and built exclusively by the WATEROUS ENGINE WORKS CO., Brantford, Canada.

Above cut represents **Our 25 H. P. Patent Direct Action Mill** which we guarantee to cut 8,000 to 12,000 feet of lumber per day of ten hours, and to be the most efficient, economical and durable mill built in America, and will saw lumber cheaper per thousand than heavy large size belted or gang mills. For over a quarter of a century the leading pioneer mill of Canadian settlers. ☞ Specially constructed for hard work.

☞This Cut represents the Engine furnished with Nos. 8, 12, 16 and 18 Saw Mills.

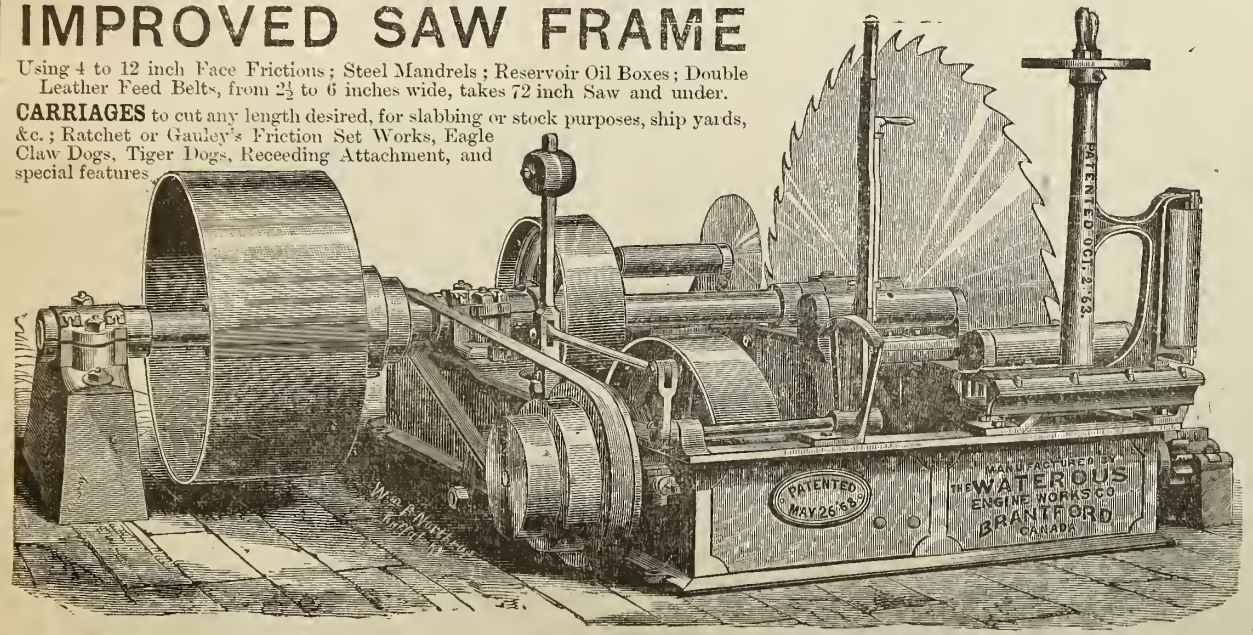


A. & P. White, Pembroke, have one of these 30 H. P. mills at Deux Rivieres, C. P. R. R.
G. C. V. Hall, Quebec, has one of these 30 H. P. mills at St. Agnes, Quebec.
Also, W. & R. Wallace, Gardner's Creek, N.B., with 60 foot Ship Yard Carriage.

IMPROVED SAW FRAME

Using 4 to 12 inch Face Frictions; Steel Mandrels; Reservoir Oil Boxes; Double Leather Feed Belts, from 2½ to 6 inches wide, takes 72 inch Saw and under.

CARRIAGES to cut any length desired, for slabbing or stock purposes, ship yards, &c.; Ratchet or Gauley's Friction Set Works, Eagle Claw Dogs, Tiger Dogs, Receeding Attachment, and special features.



Champion Portable Saw Mills

12, 16, and 20 H. P.

GEORGE BOOK writes as follows:—"ST. ANNS, ONT., July 27th, 1882.—I have just finished sawing with your 20-horse power Champion Engine, and No. 3 mill before harvest. At the last place I set down, we cut 345,000 feet, mostly inch, 70,000 being oak, in nine weeks. We were just ten weeks from time we moved mill till we returned home with it. We sawed the above without an accident or delay of any kind. I have run the mill now three years almost constantly. I find no trouble in keeping up steam with the slabs and refuse just as it comes from saw and frequently use a portion of the sawdust. I can saw 2,000 feet 1-inch lumber in an hour.

The following are a few who have bought these mills:—

Canada Pacific R. R. Co.
G. B. Hall & Co., Que. (2)
Dominion Land & C. Co. Sherbrooke, Que. (2)
Sorel R. R. Co., Que. (2)
Cochrane Ranche Co. Bow River, N.W.T.
Nor.-West Milling and Mining Co., Bow River, N.W.T.
Toronto and Nor.-West Colonization Co., Near Brandon,
Morton Dairy & Farming Co., Turtle Mountain.
Allan Grant, Ottawa.
Geo. Perley, Ottawa.
Michipicoten Native Copper Co., W. W. Stewart, Montreal

Double Edgers, 2, 3 and 4 saws; Automatic Lumber Trimmers, 5 to 9 saws each; Log Turners, Slash Tables, Log Jacks or Haul-up of all Capacities, Endless and Single Chain; Automatic Log Rollers, Transfers, Live Rolls, Shingle Machines, Drag Saws, Knee Bolters or Block Splitters, Shingle Packers, Gang Lath Mills, Stave Machines, Automatic Sawdust Feeders for Gangs of Boilers, Sawdust, Slab and Refuse Conveyors, Elevators, Pickering Governors, Worthington and Blake Steam Pumps, American Planing and Matching Machines, American Saws, Solid and Inserted Tooth, Extra Thin Circular Board Saws a specialty, Swages, Gummers, Emery Wheels, and all kinds of Saw Mill Furnishings kept in stock.

☞WATEROUS ENGINE WORKS CO., Brantford, Canada.

Send for New Price List and Illustrated Circular, of special interest to saw-mill men. ☞Mention this Paper.

QUEBEC FOREST RESERVES.

The following is the text of the measure passed in the Province of Quebec for the purpose of establishing Timber Reserves. The other Provinces might well imitate this good example :—

An Act to further amend chapter 23 of the Consolidated Statutes of Canada, respecting the sale and management of timber on public lands, and the Acts amending the same.

Her Majesty, by and with the advice and consent of the Legislature of Quebec, enacts as follows :—

1. The Act of this Province 39 Vic., cap. 11, is amended by adding at the end thereof the following sections, which shall be taken and construed as forming part of the said act.

"5. The Lieutenant Governor in Council may, as soon as the necessary information can be obtained, after the coming into force of this act, set apart as: "Forest land" all the ungranted lands of the Crown now held under licenses to cut timber," except such parts of such licensed lands on which no merchantable pine or spruce timber grows and which are fit for settlement, and also such other portions of the ungranted lands of the Crown as the Lieutenant Governor in council, on the reccommendation of the Commissioner of Crown Lands, may think fit so to set apart; and as soon as the order or orders in council setting apart such forest land shall be published in the Quebec Official Gazette and from and after the date of such publication, no land included in the territory so set apart shall be sold or appropriated for settlement purposes, until after the expiration of at least ten years, and not then until it is established to the satisfaction of the Lieutenant Governor in Council that the whole or any portion of such territory may with advantage be opened for settlement. The order or orders in Council withdrawing such territory shall likewise be published in the Quebec *Official Gazette.* The land so set apart shall be known and designated as a "Forest reserve."

"6. In the renewals of licenses effected after the publication of an Order in Council creating a forest reserve, it shall be the duty of the Commissioner of Crown Lands to exclude any land theretofore under license in the locality and which is not included in the reserve."

2. Whenever any such lands cease to form part of a "Forest reserve" and for the purpose of securing to settlers, who may thereafter occupy the same, the timber they may require, to facilitate the performance of their settlement duties, section 2 of the said chapter 23 of the Consolidated Statutes of Canada, is amended, by adding after the words: "in all," in the sixth line thereof, the following words: "red and white pine, spruce, tamarac, birch, oak, walnut, cedar, butternut, and basswood."

3. After the coming into force of this act any license issued for the cutting of any timber under the authority of the said chapter 23 of the Consolidated Statutes of Canada and its amendments shall contain a special description of the trees, timber and lumber which it is permitted to cut thereunder, and they shall be of the kind mentioned in the preceding section and none others.

4. This act shall come into force on the day of its sanction.

DEVICE FOR TRANSPORTING LOGS.

THE *Lumberman's Gazette* says :—The great expense involved in transporting logs by raft has stimulated the minds of many who are interested to an unusual degree of activity, and the question has been, and is still with many, can we get up something to transport our logs economically and safely? Cribs have been tried, but so far without success, one gentleman expended $100,000. Some lumbermen have given up all hope of transporting logs and have contemplated moving their mills near the source of supply. Mr. D. W. Case thinks he has solved the problem, He has very recently been granted a patent on a sectional boat designed for the purpose of carrying logs. Mr. Case claims he can carry logs at one-half the cost of rafting. The risks of loss he further claims would be reduced to a minimum, being no greater than the transporting of a cargo of lumber by vessel. He also claims, first, that the boat can be loaded with 500,000 feet of logs in three hours; secondly, it can be unloaded in 30 minutes, and is of light draught. Mr. Case has received numerous letters of inquiry, some parties wishing to make a purchase of the patent. A successful device for carrying logs would be of incalculable value to Bay City, and we sincerely hope it may be all that he anticipates.

SOILS ADAPTED TO HARDWOOD.

Long observation and diligent research appears to have proven that mild loamy soil in which sand and lime are present in a higher degree than clay—fresh, deep, and rich in vegetable mould—is favourable to the growth of many forest trees, such as the oak. Lime is best suited for beech, ash, maples, elms, black and Austrian pines, dwarf pine and yew. A binding clay without sufficient humus is not adapted for forest trees. In the heat of summer it cracks and injures the rootlets. Soils, if rich mineraly, although these yield trees of greater height and solid contents, will, if moist, produce timber of inferior quality and less durability.

The beech requires a strong mineral soil fresh and rich in humus. Its true home is on lime, basalt and green-stone, if the soil is not too thin. It is often found with the oak on sandy-loamy deposits, if not too dry or too moist, but on poorer and lighter soils or in exposed places it grows but slowly. Its wood is usually worth less than other hard woods in the market.

The oak depends less on the kind of soil than on its quality, the amount of humus, and above all, of moisture contained in it. The best growth occurs in a deep somewhat loamy sand, or sandy loam, but it thrives well on loam or sand. Although it prefers moisture, it will not grow in marshes unless drained. In forests the oak attains greater dimensions when grown with other oaks alone; for it thrives best with the crown free, the stem sheltered and in shade, and the foot under covering. The oak also thrives well when mingled with the beech, provided the situation is not exposed or the soil shallow.

The ash and elm have much in common, are found on similar soils, and may be classed together as regards their treatment. The true home of the ash is on a rich, loose, strong mineral soils, abounding in humus and even in binding ones, if fertile. Dry, poor soils are not suitable, and it requires a moist soil. The ash must have plenty of light, hence it does not thrive so well in pure forests. It does well in beech forests, and may be grown with oak, maple, hazel, sycamore, elm, etc., etc. In a word, those mixed forests yield in most cases a larger revenue than either of the varieties alone.

The maple delights in fresh, strong mineral soils, such as lime and basalt—in short, such as the beech, but does not bear so much moisture as the ash or elm. The sycamore makes greater claims on the soil in mineral strength and moisture than the maple.

In general, the effect which the soil and subsoil have on the quality of timber may be expressed scientifically as follows: The combustible tissues of timber, or those liable to decay by exposure to atmospheric or other agencies, are carbon, oxygen, hydrogen, and nitrogen. The absolutely necessary constituents of the ashes, or portions not liable to decay, are iron, potassium, rodium, etc., etc. It follows, then, that according as the percentage of combustible tissue exceeds that of incombustible, the timber will be less durable, and for technical purposes, of less value. Therefore, soils and subsoils in which there is a fair amount of lime, potassium, silica, etc., in a word, those rich in alkalies, produce timber of the best quality; while such as contain an abundance of moisture yield timber neither of such durability nor of so high value.—*Rural Canadian.*

DULUTH BUSINESS.

Duluth is rapidly coming to the front as a lumber producing region. It is predicted that the lumber industry will be prosecuted at that point the coming season with unusual energy, and that the output will be at least one-fourth that of Saginaw River. By some parties the season's cut, which will soon commence, is estimated as high 300,000,000 feet, but probably a closer estimate would be about 250,000,000 feet. The people of Duluth are exceedingly sanguine in regard to the future prospects of that enterprising and thriving city. There are many citizens of Bay City there and they all concur in the belief of a prosperous future for the new city in which they have set their stakes. The northwest furnishes an eager and remunerative market for their lumber, and being on a direct line of rail communication with that growing and thriving country, with a fair prospect of becoming the terminus of the roads, and an extensive shipping point, the enterprising people who have settled there have excellent foundation for the faith that is in them, Duluth must evidently advance rapidly in population, business interests and permanent growth.—*Lumberman's Gazette.*

ST. JOHN, N. B., DEALS.

The *Monetary Times* says :—The lumber export of St. John during March amounted to 1,276,000 superficial feet of deals, battens and boards, 21,000 pieces palings, 530 tons birch and 7 tons pine timber. This went to Liverpool, Glasgow and Dublin. The shipments from that port for the quarter ended 31st, ult., were as under :

Deals, battens, deal ends	9,651,386 sp. ft.
Scantling and board	40,493 "
Palings	39,000 pos.
Birch	830 tons.
Pine	279 "

The timber all went to Liverpool, as did some of the deals and palings. But London got the largest shipment of deals. Glasgow 1,399,000 feet, the Continent 1,341,000, Penarth, Dublin, Greenock, Barrow, Belfast and Africa the remainder.

OTTAWA NOTES.

The *Monetary Times* says under the heading of Ottawa :—The amount of timber cut this season will largely exceed that of the past few years. Although this is the case, the number of logs waiting to be forwarded to the mills is about the same as that of last year. In the way of explanation it will be remembered that the year previous to last there was a scarcity of water, and consequently a good deal of the timber cut then was unable to reach the saw mills.

The supply of water last summer was in excess of what was required, and therefore the cut of the preceding winter not only found its way to the capital, but the retarded portion of the previous year as well. At the close of last season very few lumber merchants had on hand any timber to be manufactured, and none on its way in the river. Indeed, as most of our readers are aware, many of the mills for want of logs had to shut down before the season really came to a close. In a few days the saw mills at the Chaudfere will be in full blast, preparations being at present under way with a view to that end, and no matter how favorable the coming season may be there is an ample supply of timber waiting the freshet to keep the machinery and men busy until the fall.

Mr. Peter McLaren, a prominent lumberman, has stated that his cut this year will be about 80,000,000 feet of lumber and 8,000 feet of square timber. The square timber will be brought to Kingston by train, and then rafted and sent down the river, this trade previously belonging entirely to the Ottawa.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* writing on March 24, says :—Many of the large producers have already acted on the agreement referred to in my last letter, to reduce the log output, and have withdrawn the horses and men from the woods. This is, I am given to understand, more especially the case in the Sundswall district, where stocks are proportionately largest. These measures are already having a beneficial effect, and several transactions are reported during the last fortnight at somewhat higher figures than those current a month ago.

The weather has taken such a severe turn in Norrland lately, that I am obliged to admit that there seems little chance of the timber ports opening so early as was at one time anticipated. There has again been a very heavy snowfall, accompanied by frost, which, at time of writing, has covered the Gulf of Bothnia with ice as far as can be seen from many of the lighthouses. According to present appearances, therefore, no great weight of sawn wood from Sweden can reach Great Britain before June, thus giving a good breathing space to importers, some of whom will be bare enough of stock by that time from all accounts.

Several inquiries are to hand from the Cape and Australia for sawn wood cargoes, but exports to these places are scarcely likely to be equal to last season. Several orders have also been placed to the north of Africa, more especially to Algerian ports and Tunis, where Swedish sawn wood meets with a comparatively new and extending market. Fair sales have also been effected to Spain and Portugal, and reasonable prices have been obtained, notwithstanding the competition of some of the Finnish exporters.

MONTREAL NOTES.

The *Gazette* says :—The prospects for the lumber trade during the approaching season are quite of a cheerful character, and it seems to be now generally conceded that there will be a large American demand for pine, and we understand that some extensive contracts have been already concluded both in this and the Ottawa districts on p. t., but said to be at full prices. Hard woods are held with considerable firmness, as there is a good demand on American as well as local account, the principal enquiry being for cherry, ash and walnut. The advance in laths has been well maintained, sales being reported at $2.50 per 1,000. The export outlook for deals and lumber is said to be very fair, and altogether the prospects are very favorable for a good season's business.

Lake Freights.

The Kingstoon *News* says ;—Private information from Chicago and Detroit has made glad the hearts of vessel owners in this locality. It is stated that the outlook for vessel business is better than it has been for a number of years past, and owners are now unwilling to accept freight that they would have been glad to accept two months ago. There will be more lumber to carry than there was during any previous season, the winter having been most favourable for taking out logs. Every western city is barren of coal, and therefore will require a large amount of tonnage. In consequence of this news the mariners were quite takative this morning.

Indian Forestry.

A report on the forest administration of British Burmah says: One of Ransome's steam tree-fellers has recently been procured from England for use in the preparation of locomotive fuel for the Irrawaddy Valley railway, the demand for which is at present about 10,000 tons a year, The machine is expected to save much expense and labor. The forests where the timber is to be cut will be re-sown with seeds of teak, pyingado. and other trees, the reproduction of which, with careful protection from fire, runs little chance of failure.

THE *Northwestern Lumberman* says :—Surveying the entire field, we find that at the East prices are firm, trade active and promising, causing a confident feeling as to values at the producing points in New England, New York and Eastern Michigan, for pine and spruce as well as at the wholesale markets that derive their supplies from the sections named. At the same time, while there is an acknowledged active demand throughout the Northwest, there is a considerable weakness manifest in the wholesale yard trade about prices. On the upper Mississippi and in Wisconsin the manufactnrers sympathize with the weak feeling, in sharp contrast with the manufacturers of west Michigan, the latter taking their cue from Saginaw. The views of the Green Bay manufacturers seem to be "betwixt and between:" they are prepared to saw lumber to the full capacity of their mills, and take the advantage of either high, medium or low prices. They have yards for assorting and distributing, an unrivaled facility for shipment, and can compete with either Muskegon or the Mississippi. The manufacturers in northwestern Wisconsin, and in Minnesota, seem to have fixed in the minds that lumber this year must be sold cheaper than it was last.

PAPER DOORS.

In the use of wood for constructing doors great difficulty is experienced from the shrinkage, swelling and warping to which the material is subject, while the general use of metal for such purpose is rendered impracticable by its weight.

To obviate these objections, a door composed of two or more sheets of paper-board, secured together and rendered homogeneous, has been devised.

Boards of properly prepared paper are taken, each having the requisite dimensions for a door and a thickness of one-third or one-half the proposed thickness of such door, and within the outer board or boards, openings are cut that correspond in size, shape and location to the ordinary panel openings. The edges of these openings are preferably molded, but, if desired, may be left plain and separate mouldings may be secured thereon after the door is completed. The outer boards thus constructed are then coated upon their inner faces with a suitable adhesive mixture, preferable composed of forty-nine parts of glue and one and one-eighth parts of bichromate of potash disolved in water, and placed upon opposite sides of a central panel board, after which they are passed between rollers and subjected to a heavy pressure which causes the boards to firmly adhere to and become practically homogeneous. The door may now be covered with any desired fire or waterproof coating and then painted in the ordinary way, after which it may be hung and trimmed in the usual manner, and from the nature of the material employed is free from all changes which are produced by atmospheric causes upon wood, costs much less than metal, and has less weight even than a door constructed from pine. —*Paper Trade Journal.*

WATER POWER.

It will be seen from their advertisement that Messrs. R. & G. Strickland, of Lakefield, are prepared to supply water power to any one desiring to establish a manufactory in that village. This is an offer worth considering by manufacturers, as the locality offers many advantages for a factory, being at the terminus of the Peterborough section of the Midland Railway, and at the foot of that portion of the Trent Valley Navigation, which is actually under construction at present, and which will afford cheap means of communication with a large extent of country. It is also at the head of the next section of the Trent Valley Navigation which is likely to be placed under construction, and that at no distant period. As to the power there is a good head with a constant and abundant supply of water.

THE NEW DOCK AT CARDIFF.

The new dock at Cardiff, of which Lord Bute cut the first sod the other day, will extend over thirty-five acres, exclusive of timber ponds, and will cost about £600,000. It is to be completed within three years. The lock will be the largest in the world, its dimensions being 80 feet wide and 600 feet high, while the depth of water over the sills will vary from 26 to 30 feet. The dock will he 2,400 feet long and 600 feet wide, the depth of water varying between 25 and 33 feet, according to tide. There will he timber ponds covering eighteen acres adjoining. All the railway arrangements and the loading and discharging machinery will be of the most complete description. When the new dock is complete there will be a water area in Cardiff basins and docks of 130 acres, and a quayage of five miles.

THE *Argus* of Albany, N. Y., says :—The activity both in selling and shipping has continued with a good attendance of buyers, and the wharves well filled with vessels loading for the east and south. All kinds of pine are being sold and particularly tally boards and plank are in demand. Spruce and hemlock are also going off fast, and some grades will soon he out of market if they are not replaced by rail. Hardwoods of all kinds are in fair stock, and are going off steadily, though the best qualities are in best demand. The manufacturers are still stiff in their prices, and seem confident that they will be able to hold them throughout the season.

HARDWOOD TIMBER.

The *Lumberman's Gazette* says :—On numerous occasions it has been our duty to caution the owners of hardwood lands in Michigan to prevent the slaughter of the timber on the same simply for the purpose of "getting rid of it," and attempted the explanation that in the not very distant future, the timber, if protected, would be more valuable than the land without the same. Proofs of our statement are already coming to light, in different portions of the state. The railroad companies in the state, and other heavy land owners, have in several instances disposed of land from which the purchasers have more than realized the purchase price from the wood removed. Joseph Barber, of Saginaw City, less than two years ago invested in hardwood lands on Swan creek and he has already realized eleven thousand dollars on the investment, and has the lands left. B. B. Bartlett, of Saginaw, bought about the same time a thousand acre farm of new land, heavily timbered lying in one of the townships of Midland, which lies next to Saginaw county. He has already realized enough from the timber, mostly elm, as is the case with that purchased by Barbar, to pay for the land. A gentleman residing in Mason county purchased eighty acres of hardwood land from the F, & P. M. railway company, and secured from the same cordwood sufficient to pay for the land, and has considerable timber still left.

Turtle Mountain Timber.

The *Northwestern Lumberman* says :—The Turtle mountains in northern Dakota, along the British line, and north of the now famous Devil's lake region, is really a high plateau, 20 miles wide and 60 miles in length. It is covered with an almost unbroken belt of timber, clear from underbrush. The growth is poplar, oak and whitewood, of good quality for making lumber. Sloping back from the highland is a rich prairie, which is at present inhabited hy half-breed squatters.

THE *Timber Trades Journal* says :—During the week ending at midnight on the 21st March there were 14 British and 27 foreign sailing vessels, and 6 British and 1 foreign steamers, reported at Lloyd's as missing, or having met with various marine casualties. Of the gross total—48 ships—6 were with cargoes of timber, hut only suffered the loss of three hands between them, of the remainder three vessels all the crew, and three others, 29 men together. The whole number of wrecks &c., dating from the commencement of the year, is 582 sailing vessels and 145 steamers, or 727 ships of all nationalities.

C. H. PLUMMER, of East Saginaw, who is purchasing 7,000,000 feet of so-called hardwood logs, the present season—the entire product of which finds a market in Chicago— informs a correspondent of the *Lumber Trade Journal* that two-thirds of this is ash, the remainder hardmaple, elm, basswood and oak. The grey ash of this section is much preferred in Chicago to similar timber from other states ; but white ash from Indiana is better than that from Michigan, as the rapid growth of timber here has a tendency to make it brash. A mistaken idea, which has gained credence in some quarters, is that there is no considerable supply of this hardwood timber in Michigan. The fact is "the woods are full of it," and that it is to bear a very important part in padding out the timber supply.

THOUSANDS UPON THOUSANDS of dollars have heen spent in advertising the celebrated Burdock Blood Bitters, hut this fact accounts only in part for its enormous sale. Its merit has made it what it is—the best blood medicine ever devised hy man.

Mr. J. R. SEYMOUR, Druggist, St. Catharines, writes that he finds an ever-increasing sale for Burdock Blood Bitters, and adds that he can, without hesitancy, recommend it. Burdock Blood Bitters is the grand specific for all diseases of the Blood, Liver and Kidneys.

EVERY PERSON TO BE A REAL SUCCESS in this life must have a specialty; that is, must concentrate the abilities of hody and mind on some one pursuit. Burdock Blood Bitters has its especialty as a complete and radical cure of dyspepsia, liver and kidney complaints, and all impurities of the blood.

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus :

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humhug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address
ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

EARS FOR THE MILLION
Foo Choo's Balsam of Shark's Oil
Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.
This Oil is abstracted from peculiar species of small **White Shark,** caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous,** that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.
Hear What the Deaf say!
It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.
"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*
☞To avoid loss in the Mails, please send money by REGISTERED LETTER.
Only imported by HAYLOCK & JENNEY,

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

PETERBOROUGH, Ont. MAY 1, 1883.

MESSRS. Gilmour & Co., Trenton, are making extensive preparations for a heavy cut of lumber. They intend running all their mills day and night.

THE Belleville *Ontario* says :—Fourteen cars of timber arrive here now every evening from Hastings. A force of men is now engaged rafting the same just east of the Grand Junction dock.

THE Emerson *International* says :—Judging from the immense quantities of lumber constantly arriving at the station, our lumber dealers expect a large trade in building the coming fall and winter.

AT a meeting held in Edinburgh on the 30th March, under the presidency of the Marquis of Lothian, preliminary arrangements were made for holding an International Forestry Exhibition in Edinburgh next year.

LESS logs than on last season have been cut on the St. John waters on the Maine side of the boundary line. A Bangor lumberman largely interested in Aroostook, estimates the cut on St. John waters in that county, at 75,000,000 feet.

THE official report of the damage by the Michigan forest fires in 1881 shows the value of the property destroyed to be over two million dollars. Over three thousand buildings were destroyed, and one hundred and twenty-five lives were lost.

THE St. Thomas *Journal* says that Thomas Ouillette, of Anderdon, has shipped from his mill at Colchester, three and one-half million feet of oak car stuff to the London Car Works, at London. He says the demand for that class of timber is greater than the supply.

THE *Northwestern Lumberman* says :—There is a big freight blockade up north, and particularly on the Chicago & Northwestern road. At Winona, Minn., the lumber dealers are having great trouble about obtaining cars. A steamer was recently there brought into service to deliver lumber, and negociations were being made recently for the shipment of 500 or 1,000 carloads by the water route.

MR. ANDREW STALKER is about to establish a large planing mill and sash and door factory at Darlingford, the centre and distributing point of the rich Pembina Mountain district, and likely to develop into a solid business town very rapidly.

A despatch from McIndoes Falls, Vermont, dated April 19, says :—The lumber companies have started to drive ninety million feet, This is the largest quantity ever driven down the Connecticut river. It will require 600 men to perform the work, and takes 125 days to reach Holyoke and Hartford. The expenses of the drive will be $1,500 a day.

AN important trial of rising the osier, or water willow, is to be made by P. V. Lawson, of Menasha, Wis., who has a farm of 1,100 acres near Green Bay. He has ordered 60,000 sprouts from England and Belgium, which he will set out on the low lands on the bay shore, with a view of ultimately furnishing supplies to the eastern willow factories.

THE Belleville *Intelligencer* of April 17, says: The task of driving on the tributaries of the Trent River was begun yesterday morning by a force of men in the employ of Alex. Carscallen, of Marmora; work was begun on Beaver Creek. The rivers in that section have opened well, and the prospect of getting the logs down early is at present quite promising.

THE Belleville *Ontario* says ;—The Messrs. Rathbun intend manufacturing illuminating gas for their establishment and the village generally. It will be produced from saw dust, and the work of excavation preparatory to erecting the necessary works is already well advanced. The works will form a branch of the Chemical Works. Mr. Walker is manager.

THE largest trees are the mammoth trees in California. One of a grove in Tulare county, according to measurement made by members of the State Geological Survey, was shown to be 276 feet high, 106 feet in circumference at the base, and seventy-six feet at a point twelve feet above the ground. Some of the trees are 376 feet high and 34 in diameter. Some of the largest that have been felled indicate an age of from 2,000 to 2,500 years.

A TRENTON despatch, dated April 23rd, says that Messrs, Gilmour & Co's. large saw mill started up on Friday. On Saturday afternoon sawing was successfully commenced. This firm are rebuilding the long row of tenement buildings that were destroyed by fire on Mill street, and are also building three very nice small tenement buildings near the central school. They also purpose charging their employees reasonable rents for their buildings.

THE *Lumberman's Gazette* says :—It is a sight worth seeing the monster roll-ways of the Wright & Ketchum narrow gauge logging railway on the Tittabawassee, four and a half miles above Averill ; and the F. & P. M. roll-way at Averill. At the former grounds are piled 17,000,000 feet of logs, and at the latter 16,000,000 ; filling up the river in each instance from bank to bank for the whole length of the grounds, and presenting an aggregate of wealth in pine logs that is as interesting to spectators as it is comfortable to owners, and there is no small amount of travel in that direction, merely for the curiosity of seeing these monster log piles.

WHILE examining the coal areas of the Saskatchewan Mining Company, Mr. Lawson, engineer of the company, says he discovered the remains of an ancient forest at a depth of over two hundred feet from the top of the ravine. The stumps are plainly visible, and are about two feet in height, and look very much as though the forest had been laid low by the woodman. In addition to this interesting discovery, the fossil remains of a gigantic reptile were found under the coal in a stratum of light sandstone. The skeleton is over thirty feet in length, and is partly exposed, the remainder being firmly embedded in the earthly matter. Mr, Lawson has two of the creature's tusks.

THE *Northwestern Lumberman* says :—In Ogemaw county, Mich., the lumbermen are afraid that many logs will be hung up this season on account of low streams. This may seem strange, when the heavy body of snow that has prevailed is considered ; but it claimed that the ground was unfrozen when the first snows fell, and as the melting process has gone on slowly, the resulting water soaks into the light soil instead of flowing into the streams.

THE ravages of some insect on the spruce trees in Northern Maine, says the Bangor *Commercial*, is becoming a serious matter to owners of timber lands. A gentleman who is well acquainted with the wooded tracts in the vicinity of Rangely says that if the work of devastation goes on five years more as it has for five years past, it will destroy all the spruce trees in that section. The larva, in which state the insect does the mischief, is a green worm about an inch long.

THE *Lumberman's Gazette* says :—It is probable that the coming season will witness somewhat of a decline in the price of walnut lumber. Last year's cut was considerable more than the average, and extensive additions to facilities for cutting and transporting were made, in the way of new mills and tramways through heretofore inaccessible sections. Stocks of lumber in yards are full, the demand having been comparatively dull for several months, and prices are correspondingly weak.

CARE OF SAWS.

A glance at the different saws that are sent to a saw factory for repairs, is sufficient to demonstrate that, notwitstanding the writers on the care and management of saws would seem to have worn the subject threadbare, there are many mill owners and sawyers who do not understand the first principles of keeping a saw in order. They seem to be blissfully ignorant of the use of that indispensable tool in all well regulated mills, the saw gummer, and we find saws filed with square corners under the teeth, inviting a crack which will ruin the saw plate once and forever. The swage also, simple as is its use in the hands of a good workman, is to others only another devise to defeat the very purpose for which it was intended. We have examined saws whose points were hammered down in such a manner that they could not possibly do good work. There is no excuse for this. The economical production of lumber demands that the saw be kept in good order. Every man who has charge of a saw should familiarize himself with the requirements of his position. If his establishment is not supplied with a gummer he should procure one and learn how to use it ; and if, as is probably the case, a swage is used, he should also know how to use that. In the hands of ignorant persons the swage may do more harm than good. These remarks apply more particularly to those establishments commonly known as country mills.—*The Wood-Worker.*

LUBRICATING OILS.

It is stated that a good test for lubricating oils is to place single drops of the different kinds to be compared in line across the end of a piece of plate-glass about twenty-four inches long, one end being six or eight inches higher than the other to form an inclined plane. The drops of oil run down this smooth plane in a race with each other. The quality of the oils for lubricating purposes is shown by the distance travelled and the traces left by the drops. Thus, on the first day sperm oil will be found in the rear ; but it will in time overtake the rest, and retain its power of motion after most other oils have dried up. A light-bodied oil flows quickly, like water, but also dries quickly, whereas what is needed is a good body combined with a limpid flow. Many oils have a good body, but have a teudency to gum ; and this will be distinctly shown upon the glass. It is scarcely necessary to remark that the test slip should be covered from dust while the experiment is being made. The above method will show the physical qualities of different descriptions of oil ; but if the presence of acid is to be detected, another simple device may be adopted. In sheet of bright copper a number of shallow pits are made by the blow of a round-faced hammer. Samples of oil left some days in these dishes on a shelf in the engine room will show, by the formation of verdigris, where acid is present. The existence of a blue tinge of fluorescence in a glass phial of oil is frequently assumed to indicate presence of mineral oil ; but this is an illusory test, since the same is frequently observed in the purest and freshest vegetable oil.—*Scientific American.*

IMPROVED SAWING MACHINE.

An improved sawing machine has been recently patented by Mr. H. K. Olsen, of Coalville, Utah Territory, and designed for felling trees and sawing logs into lengths. The machine can be driven by hand or power, and is capable of working either horizontally or vertically. It has an automatic screw feed for moving the saw forward when making a horizontal cut, and this feed is readily detached when it is desired to saw vertically, so as to allow the saw to feed by its own gravity. The entire apparatus is mounted on a light portable frame, so that it may be easily transported from tree to tree or log to log, as occasion may require. The crank shaft and the driving shaft are mounted in sliding boxes, movable up and down by the windlass at the top of the inclined posts. The crank is wide to admit of the lateral movement of the connecting rod, and it is adjustable as to the length of its stroke ; the design of this arrangement being to adapt the machine to different kinds of work. The saw guide moves through a sleeve that is adjustable along the slotted bar by means of the screw in the slot of the bar. The screw receives its motion from the driving shaft of the machine by a belt. As the crank of the drive wheel is turned the saw is reciprocated, and at the same time moved forward to its work. When it is desired to saw vertically, the feeding screw is disconnected from the saw guide, and the slotted bar is placed in a vertical position, as shown in dotted lines in the engraving. The joint between the saw guide and the connecting rod is swiveled of to admit turning the saw at desired angle. This machine works rapidly and easily, and may be operated by one or more men, or by horse or steam power.—*Scientific American.*

LUMBER FOR OARS.

"This is the oar market of the world," the genial head of a large New York house said, "and few persons not in the business have any adequate conception of its magnitude. It is not an uncommon thing for us to send abroad an entire ship's cargo of oars—nothing but oars. Of course it isn't a thundering big ship, but a pretty good lump of a schooner, for instance. Why, another firm and our firm—we divide the business between us on the staple, selected white ash oars—handle together about 250 carloads of oars per annum, say about 5,000,000 feet, worth at least $400,000 on an average of 8 cents per foot, which is none too high an estimate. We have one contract on hand for the French Government that will take 500,000 feet of ash logs to fill it. As you will readily understand, the consumption of white ash, which is by no means so abundant as many other woods of less value, has made itself seriously felt, and our oar factories are all the time forced to move further and further away to reach new fields of suitable timber. Time was, within my rememberance, when nearly all the oars were made in Pennsylvania, but white ash is so scarce there now that the factories are few and small. The bulk of the oars come now from Michigan and Ohio, though one factory has recently been started as far west as Arkansas. We have four factories—at St. Mary's and Montpelier, Ohio, and Carrollton and Breckeuridge, Michigan. And I don't suppose I'll have to live to be very old to see them shoved out further towards the wilderness to find material. All this applies only to the standard white-ash oars. Two-thirds of those we make are shipped abroad. England is our principal consumer. Those that go to the French Government, which buys enormous quantities, are sent in the rough, that is barely outlined in a rough squared stick of timber. The superannuated marines and soldiers are employed to finish them by hand.

USING UP THE TIMBER.

To the uneducated in the lumber trade no idea can be formed of the vast amounts of timber that are annually cut on this continent, hence many are inclined to oppose economy in the treatment of forests, and are difficult to convince as to the rapid manner in which they are destroyed. Though, when the subject is investigated and statistics examined, it will be seen that a few years of active operations will denude any portion of the most densely timbered lands. Such figures as 24,000,000 feet in one place, 50,000,000 in another and 1,500,000,000 in another, and they representing the cut in the neighborhood of one stream, form but a fractional part of the cut all over the country. The value of timbered lands should be greater at present than ever before, and no matter how far they are removed from transportation they are too valuable to be wantonly destroyed. Just as soon as the most eligible are utilized, necessity will force transportation facilities towards the others, and as a consequence, render them valuable. It is very questionable if any lands in the south, upon which there is a full growth of pine, poplar, hickory, elm, gum or cypress, could be made to produce by clearing them, what the standing timber will be worth in the same given number of years. Therefore, let the southern land-owuers take warning, and not only economize their timber, but hold on to the land for a few years at least.—*Southern Lumberman.*

THE MINISTER OF AGRICULTURE.

In his annual report of Minister of Agriculture for the Dominion says :—The subject of forestry, which is now attracting considerable attention, is under my special consideration and I would urge upou the farming community the necessity of preserving, as much as possible, the trees on their land, not only with a view to the conservation of timber for economic use, but also with regard to the climatic influences attendant thereon. Waste in standing timber should be avoided,and attention should be given to the planting of young trees, to supply the place of those already cut. The effect on climate, arising from the denudation of forests, manifests itself in protracted droughts, and drying up of water-courses, and unless the balance of nature, by means of trees, is restored, the ultimate consequences to agriculture may be very serious. In the Northwest especially, I would urge settlers to plant trees on their homesteads, as soon as they get possession. The beneficial effects of this will be manifold, both as a protection from the prairie wind and as providing a source of fuel and timber for farm purposes. Planting hardwood and pine or other rapid growing trees alternately in belts is recommended, as materially assisting growth. Pine will have acquired sufficient size to be of use, when the time for thinning out arrives. The whole subject of forestry is one deserving the attention of agriculturists especially, and the community generally.

THE BUSINESS SPREADING.

The lumber business is rapidly spreading, and if mills go in as fast as they have for a few years past, operations will be in progress in nearly all the forests of the country. There are plenty of men who remember when Maine was the great lumber state, and when Pennsylvania was called a sort of side show to the general business. The Northwest was an unknown wilderness, and little was known of the timber of the South. A few mills were running on the Pacific Coast, but even twenty years ago the receipts of redwood at San Francisco were only about 40,000,000 feet yearly. Gradually the lumbermen pushed their way into the lower peninsula of Michigan, and thence into Wisconsin and Minnesota. All over these three States mills are located here and there, with the exception of northern Minnesota, and even that section is being invaded. A map of the South, with the location of every mill marked on it, would be spotted indeed. Even in the mountains of West Virginia and North Carolina is heard the shriek of the mill whistles. Mills, of large capacity, are slashing away on the timber of Washington territory—a field that will be a most prolific one. There yet remains on the Rocky mountain slope an immense body of pine, at present, it would seem, almost out of the reach of man, but no doubt in time it will fall before the march of the lumberman—men who do not know what to halt is. It would not be much of an exaggeration to say that every forest from the Atlantic to the Pacific, and from the Canadian line to the Gulf of Mexico, is tributary to saw mills.—*Northwestern Lumberman.*

STEAM CRAFT IN LUMBER CARRYING.

A great change has been wrought in the methods of lumber carrying on the great lakes within a comparatively few years, which is very marked with respect to the traffic between Chicago and Lake Michigan ports. This change is growing more apparent every season. For a long time it was supposed that the winged winds were the only proper power for propelling the lumber laden craft across the lakes, and it was not believed that any less tedious means could be successfully substituted. But gradually, as the operator's business became exte ded, and his profits, in great part, depended upon not only producing lumber rapidly, but upon transporting it in greater volume and more expeditiously than the whims of the wind would permit, he set about to find a way by which he might conduct the carrying part of his business more advantageously. He argued that a businesss that will pay at all will pay best when the best facilities are employed in its prosecution. The mill upon which he had spent thousands for every available improvement, and which, in some cases, was turning out its hundreds of thousands of feet daily, was not rightly mated with the schooner that could take but the cut of a day, and which, at its best, bore it with a snail's pace to market.

Up to a few years ago probably nine-tenths of the lumber produced at many of the more prominent northern points came to the Chicago market by schooner. The proportion has grown less every year, until now nearly half of the lumber cut at those points is brought by steam. It will not be an uncommon thing this season to have from three to five barges from a particular point unloading at Chicago docks, while the same number are loading at the same point to follow in short order.

The spirit of progress and the necessities of the case have led to the now quite general adoption of steam in transporting lumber. The plan at first was looked on as a rather crazy and ridiculous scheme, entirely impracticable, and well qualified as a losing investment. The idea of incurring the expense of an engine, with the requisite amount of fuel and labor incidental to its employment, in place of the gratuitous efforts of the gentle breezes, was looked upon as very bad policy by those advocates of sailing vessels who were wedded to their folly beyond the hope of divorce. But time has shown to whom the wisdom must be credited. Several of the larger lumber concerns, who are manufacturers and jobbers in one, would be to-day unable to transact the immense business which has fallen to their lot, if they had not the expeditious and economical barge system at command, operating with clock-work regularity in taking the product of the mills and placing it at the yards as fast as made, avoiding delay and rehandling, while having an important effect in cheapening lumber.—*Northwestern Lumberman.*

BOOMS IN NAVIGABLE WATERS.

Sir Hector Langevin, in the House of Commons on April 24th, in moving the second reading of the bill from the Senate respecting booms in navigable waters, explained that its object was to legalize the placing of certain booms in navigable waters in New Brunswick. These booms had been erected on the strength of Acts of the local legislature, but it has been decided that these provincial Acts were *ultra vires.* The bill was proposed with a view to obviating the necessity of removing the booms.

Mr. Blake said this was simply a proposition that Parliament should surrender to the Crown the right to say what navigable rivers should be interfered with by the erection of booms, dams, etc. It was also a proposition that the Crown should have authority to say when booms and dams were nuisances and should be removed. This was the assumption of arbitrary power.

Sir Hector Langevin said the power proposed by the bill to be handed over to the Government were not at all excessive. Already the Government had authority to order the removal of wrecks if they interfered with navigation, and the only new power the Government would have under the Act was to compel builders of dams and booms to conform to the law and not to stop navigation where a stoppage of navigation was undesirable.

The bill was read a second time.

VALUABLE

Timber Limits

And MILLS

FOR SALE,

CONSISTING OF :

About 300 miles of limits in the Counties of Joliette and Montcalm, in the Province of Quebec, well wooded with spruce, pine, cedar, and traversed by the La Quarreau, Dufresne, and other rivers.

About 25 acres of land (freehold) with a splendid water power and saw mill, store, dwelling house and outbuildings, on the La Quarreau River, at Montcalm, about 40 miles from Montreal.

About 100 acres of land (freehold) with a splendid Steam Saw Mill, capable of cutting 100,000 logs per annum, a large house for manager, 14 dwellings for employees, large machine shop, planing mill, bakery, store, fire engines and house, wharves, a steam tug, 3 barges, &c., &c., at Charlemagne at the mouth of the L'Assomption River, about 17 miles from Montreal.

Also, booms and dams on La Quarreau, Dufresen, L'Assomption, and other rivers.

Three vessels drawing 6 to 8 feet of water can load at the wharves at ouce, and ships, drawing 25 feet, can anchor with ¾ of a mile from the wharves, and load from barges.

The whole is complete and in running order for carrying on a large and profitable lumber business, and will be sold at a low price and on favorable terms.

For particulars apply to THE EXCHANGE BANK, Montreal, or to

JOHN M. M. DUFF,

Public Accountant,

3L8 118 St. James Street, Montreal.

THOMAS JOWITT & SONS

ARBOR DAY IN NEBRASKA.

The *Lumberman's Gazette* says :—The proclamation of Gov. Dawes, of Nebraska, is so pregnant with facts and thoughtful suggestions to every person at all interested in forest cultivation and preservation that we publish it entire, and bespeak for it a careful perusal :

To the people of Nebraska :

The subject of forestry, or tree planting, is fast becoming one of importance, and is receiving the careful attention of thoughtful minds throughout our country and in other lands as well.

The steady and rapid disappearance of our forest is viewed with apprehension. We are forced to consider the matter of future demand and supply, and in view of the facts it becomes a question of grave moment. The disappearance of the natural growth of timber has been followed in many states by the drying up of springs, and brooks, and decreased annual rainfall, and consequent increased frequency of seasons of extreme drought. The presence of trees and forests exerts a direct and controlling influence upon the moisture of the air and amount of rainfall, as well as serving to lessen the extremes of temperature and greatly modifying the severity of climate and season. The attention of the general government has been directed to the matter, and it has received substantial recognition at the hands of our national congress, in the passage of what is known as the "timber culture act," which has for its object the securing of timber upon our treeless prairies. Encouragement and incentive in the matter of tree planting are given by the constitution of Nebraska, which says : "The legislature may provide that the increased value of lands by reason of live fences, fruit and forest trees grown and cultivated thereon, shall not be taken into account in the assessment thereof." The state board of agriculture offers liberal premiums for the greatest number of trees planted during the month of April, 1883, by any one person, and for the greatest number planted or put out during the year 1883. In addition to this they offer a special premium—known as the "arbor day" premium—for the greatest number of trees planted upon a given day—divided and classified as to the varities—and earnestly inviting competition therefor from all. The question of tree culture, important as it is to the country at large, is of paramount importauce to our state. Nebraska embraces within her limits lands that are unsurpassed in fertility ; and offering as they do advantages in the way of easy and simple cultivation, they are being developed with a rapidity that is nearly, if not quite, without precedent.

Therefore, to the end that the past gratifying degree of development and improvement may be maintained, and, if possible, increased, I, James W. Dawes, governor of the state of Nebraska, hereby name Wednesday, the 18th day of April, A. D. 1883, to be observed as "Arbor Day," embracing in its design results so varied, beneficial and far-reaching ; having for its aim and purpose the common interests and general welfare of our state, it should be strictly observed by all classes. Having reference both to ornamentation and usefulness ; to beauty and utility ; considering the claims of present enjoyment and ultimate profitable investment, care should be exercised, and selections for planting made from such varieties as have been approved by the tests of time and experiment as suited to the condition of our soil and climate. Be it remembered, that the person who plants and causes to grow—if but a single tree, shrub or vine is contributing his or her mite in the way of added inducement and attraction tending towards that fuller development and ultimate standing of Nebraska, for which we are all laboring and hoping, and which will surely come.

JAMES W. DAWES.

THE BOSTON TRADE.

The Boston correspondent of the *Northwestern Lumberman* says :—It is wonderful what a difference a few pleasant days will make in trade after a protracted spell of stormy weather. Everything and everybody seem to wake up, and activity is noticeable on every side. The trade during March was not quite as large as some had expected, yet for all that it was more than fair, and if this month continues good weather it will bring sales up above the average of last year.

Considerable lumber has come in the past few days, much of which has been shipped since rates dropped. Arrivals by the northern lines are somewhat more frequent, the blockade which has been caused by snow during the winter months having been pretty nearly cleared up.

Pine is selling somewhat more freely than it was the first of the month. Prices remain unchanged, and dealers seem more willing to pay ruling prices, realizing, as they must if they keep themselves properly posted, that prices will not go lower, but stand an even chance of advancing. The best grades of pine are in demand more largely than the coarse, although barn boards are called for quite freely, the trade being about evenly divided between Michigan and Canada boards. I hear of one or two good sized shipping orders having been placed the last week.

Yellow pine continues in good demand, and dealers in this lumber are having plenty of orders. Prices, although not as high as a few months since, are firm, and in this respect are in advance of other markets, and southern mills are soliciting Boston trade quite freely. It cannot last long, for the demand in other sections must soon be up to the supply, and prices will strengthen accordingly. The demand just now is largely for resawed stuff. The supply of boards in the market is quite ample for present demands.

The spruce mills in Maine and New Hampshire are very busy. It has been a big logging year. In some instances more logs have been got in than can be sawed. Orders are plenty, and about all that troubles our yard men now, is that they are unable to have schedules filled fast enough. They all want their orders at once, and somebody must wait ; however, these stormy days which have been a curse in some respects, have been a blessing to those who have been pressed to deliver frames, for it was not possible to use them during stormy weather.

Our hardwood trade holds its own. I cannot say it improves any, although the demand is steady and in good proportions. Prices remain just about the same.

WOOD *v.* STONE PAVING.

"A Large Ratepayer,' writing to the *Liverpool Courier* in reference to the recent meeting of the Council, when the abovo question was a subject of great controversy, says :—" Being a tradesman having premises in Bold Street and also in one of the sett-paved streets, and having taken careful note during many years of the questions involved, I assert, without fear of contradiction,—

1st. That any proposal to remove or abandon wood pavement here would be received with extreme disgust and indignation.

2nd. That, in spite of a suggestiou to the contrary, the pavement has not required renewal, the only portion relaid being a few yards at the top where the surface was much ground by detritus washed from Leece Street, and the relaying of which was on all hands condemned as a piece of extravagance, as the surface was far better than any macadam or sett pavement ever is, and the basement sound and serviceable. The only other repairs have consisted iu sundry small patchings recently made, apparently intended to destroy the neighboring pavement, as they are not impervious to water, as good wood pavement should be.

3rd. That supposing wood pavement does cost more to maintain than setts (its first cost was only about one-half), it is well worth the difference for the following reasons. The comparative quiet euables a much larger amount of mental work to be performed than if the worker wore exposed to the abominable din of a stone-paved narrow strect (five or ten per cent. in the labor of the 2,000 or 3,000 persons employed in Bold Street is no trifle). It is far cleaner than stone pavement. It is far safer for horses—contrary to a snggestion made in the Council. Such a thing as "a horse down" in Bold Street has been almost unknown since the advent of wood.

Lastly, it promotes health, as with it doors may be kept open for eight months in the year, to the great benefit of all those employed in the street. Seeing that, in proportion to our means, we contribute probably four times as much to the local rates as other inhabitants, it is not too much to require at the hands of the Council something like fair and liberal treatment.

In conclusion I would say that whilst in London and elsewhere wooden pavement is being largely adopted, and is universally welcomed, the persistent attempts to discredit it by Liverpool officials is a source of astonishment (and something more).

THE ST. LAWRENCE.

The Montreal *Gazette* of April 17 has the following interesting statistics as to the date of the opening of our great river :—

Up to midnight there was no apparent change in the condition of the river. The water had risen to within six feet six inches of the top of the revetment wall, being a total rise of three feet since noon on Saturday. During the month the total rise has been seven feet four inches.

The following statistics compiled by a gentleman who has made a study of the subject will be of interest. The gentleman in question, who has made a study of the opening of the St. Lawrence for a number of years back with a view of determining the probable date of arrival of vessels in the river, has come to the conclusion that the first river steamer arrives about twelve days after the first breaking up movement of the ice, and the first ocean steamer from 20 to 25 days from the same period. In support of his opinion he furnishes the following figures :—

1878—	First	shoves	17	March
"	"	River steamer	29	"
"	"	Ocean "	20	April
1879—	"	Shove	12	"
"	"	River steamer	24	"
"	"	Ocean "	1	May
1880—	"	Shove "	5	April
"	"	River steamer	17	"
"	"	Ocean "	2	May
1881—	"	Shove	5	April
"	"	River steamer	22	"
"	"	Ocean "	29	"
1882—	"	Shove	28	March
"	"	River steamer	19	April
"	"	Ocean "	6	May

From these data the gentleman referred to argues that as the ice first commenced to move this year on the 13th of April, the first river steamer will arrive from the 22nd to the 25th of April, and the first ocean steamer from the 4th to the 8th of May.

THE AUSTRALIAN TRADE.

Messrs. Gemmell, Tuckett, & Co.'s report, dated Melbourne, February 14th, says :—Since last issue the deliveries of timber from the store-yards has continued on a large scale, for supplying works in progress and contracted for some time since. The increased rates now ruling for moncy aud the failure of the Victorian loan in London will undoubtedly in the near future have the effect of largely curtailing the demand for all descriptions of building materials. Prices realized at auction are lower, but unless the market is unduly forced we believe prices are now as low as they are likely to be for some time to com. American lumber.—Sales ex Penobscot, 1¼ in. Canadian clear, £12 7s. 6d., and 1½ in. do., £14 12s. 6d.; 12 in. shelving, £10 15s. Ex Belle of Oregon, Michigan clear, 2½ in., £18 7s. 6d.; 3 and 4 in. do., £18 ; 1¼ in. Canada do., £13 12s. 6d. to £13 10s.; 1½ in., 2 in. do., £14 ; 12×1 dressed clear, £15 to £14 17s. 6d.; 12 in. w. p. shelving, £11 5s. to £11 7s. 6d.: 12 in. do., £10 2s. 6d. to £10 ; 11 in. w. p. t. and g. ceiling, £9 7s. 6d. Ex Penobscot, Tillie Baker, City of Adelaide, and Loining, 1¼ and 2 in. Michigan clear, £17 7s. 6d. to £17 ; 14 in. w. p. shelving (inferior), £18 12s. 6d.; 16 in. do., £9 to £9 15s.; 12×1 dressed clear, £15 per m. feet snper. Shipments of this liue have now supplied trade requirements, although stocks are not heavy. The fear of transhipment from the other colonies has had a depressing effect, and prevents any desire to increase stocks beyond immediate requirements.

Messrs. C. S. Ross & Co. report :—The arrivals of timber have been very large, especially in flooring boards and colonial woods, consequently prices realized for heavy parcels offered show a further decline, and it is now evident that the very large demand which has existed for the past year is rapidly falling off, owing to the stoppage of speculative building. The attendance at sales continues above the average of former years, but the bidding is very slack, and each succeeding offering shows a slight decline in prices. The stock in hand is considerably above the quantity held at any previous period in the colony's history, and unless shipments next season are unusually light, prices will be far below the cost of importation.

Arbor Day.

His Honor the Lieutenant Governor of the Province of Quebec has just issued a proclamation in accordance with the bill passed during last session respecting the culture of forest trees, which enacts, among other things, that the Lieut. Governor in Council shall have power to fix a day known as Arbor Day. The proclamation provides that, as the climate is not the same in all parts of the Province, two divisions will bs made ; one, to be called the Western Division, will include the counties west of Three Rivers, and the other, the Eastern Division, will embrace the counties situated east of Three Rivers and Nicolet. The 7th of May is fixed as Arbor Day for the Western Division and the 16th of May for the Eastern Division. All persons throughout the Province are invited to set aside the above mentioned days for the planting of forest trees, and all corporations, municipal, religious and others, are especially requested to use their influence for the success of this important work,

Railway Earnings.

THE annual report of Mr. A. White, Traffic Manager of the Midland Railway of Canada, contains the following paragraph :—

"Coming down to an analysis of the freight earnings, which yield more than two-thirds of our trade, we find in the first staple commodity, viz.: lumber, that in 1882 was earned $171,853, and from the quantity on hand at the present moment, as compared with stocks held this time last year, combined with the known nnmber of logs that have been harvested during the recent winter, we may calculate upon an increase in our lumber receipts of twenty-five per cent. On square timber in 1882 we earned $21,814, and have already under contract this year more than double the quantity of timber we carried last year."

A Timber Merchant's Benevolence.

Mr. Amos Roe, of the saw-mills, Worcester Wharf, gave a treat to upwards of 2,000 poor children in Bingley Hall, Birmingham, on Good Friday. A few years ago Mr. Roe invited several poor ragged children in the neighborhood of his works to breakfast on the morning of Good Friday. The invitation was repeated annually, and the number of children became so large that adequate accommodation for them could not be found at Mr. Roe's works. Last week, through the kindness of Mr. J. Lowe and the committee of the Cattle Show, Bingley Hall was placed at the disposal of Mr. Roe, and there, by nine o'clock, upwards of 2,000 poor children had assembled for the treat provided for them.—*Timber Trades Journal.*

THE *Northwestern Lumberman* says :—The mills on the Mississippi are starting up for the seasou, logs are going down the river, and soon the new cut will begin to move into the trade. It is likely that the markets at valley points will have an ample supply of new lumber before the jobbers of this city have made up their minds to re-stock their yards. The demand from beyond the Missouri promises to be prodigious iu Kansas and Nebraska, while the Dakota boom in emigration will call for an amount that was not adequately estimated last winter. Individuals who have travelled westward say that the rush of new settlers to all the unoccupied sections in Kansas, Nebraska and Dakota is unprecedented. Trains are crowded with people and their movables ; and, as they are going out in advance of any preparation for shelter, a vast number of houses will have to be built to cover them before snow flies next winter.

Chips.

THE Belleville *Ontario* says :—If the lumbermen have as good luck this season as last some of them may safely retire from business rich men.

THE *Northwestern Lumberman* says that every indication points to a booming demand in Dakota, Manitoba, and the Northwest Territories.

A PITCH pine tree on Grant creek, Missoula county, M. T., is reported to be 125 feet high, and 27 feet four inches in circumference, five feet from the ground.

CYPRESS timber, at Orange, Texas, was sold at $12 a stick, for the best, lately—a good figure that made it probable that there would be renewed activity in the swamps.

So many logs have been cut and hauled this season in Maine that it is thought the mills will not be able to saw more than half of them. In the Machias Basin alone 30,000,000 feet of logs have been cut.

Messrs. R. & G. Strickland have cut this season in their limits in Hindon and Oakley, over 300,000 cubic feet of timber for the Quebec market. They have also cut about 50,000 from the same limits.

A GREAT fire broke out at Cacilhas, on the Tagus, opposite to Lisbon. The English cork manufactory belonging to Messrs. Bucknall & Sons was totally destroyed. The loss is estimated at £100,000.

THE cherry tree which Mr. Gladstone felled in a snowstorm during the Easter recess has been presented to the Burslem Liberal Club, whose members purpose holding a bazaar in September next, and intend to have a number of articles made of the wood from the tree.

THE Kingston *News* says that the risen waters at Milhaven on Friday April 13th carried away two dams, and then lifted Mr. H. Fairfield's saw mill and deposited it bodily in the bay, when it went to pieces. The water also undermined the grist mill. Mr. Fairfield will build a new mill as soon as possible.

THE annual official report of the Dominion Minister of Agriculture urges farmers to give their attention to the subject of preserving our forests ; settlers in the North-West are urged to plant trees on their homesteads as soon as they get possession ; hardwood, and pine, or other rapid-growing trees, alternately in belts, being recommended.

BOSTON, Mass., has set out to scoop its rivals with a new industry. The Boston Lamina Wood Company is making a three-ply wood scoop for tea and groceries. The middle layer is placed with the grain of the wood running at right angles to that of the two outer layers. The scoops are given two heavy coats of shellac varnish. They are pronounced more serviceable than tin scoops.

AT Fergus, Ontario, a jam of logs and ice over a mile in length was blocked for several days on the Grand River, above Reid's mill, but the heat started it on its downward course. It carried away part of Reid's dam and lodged against the bridge above Wilson's mills, but Semple's dam succumbed to all before it and passed down the river. It will cost upwards of $1,500 to replace it.

THE *Lumberman's Gazette* says :—We occasionally read of large trees of different varieties, but New Albany, Ind., has an apple trees in comparison to which all other apple trees in the country are dwarfish. The trunk of this famous apple tree is eight feet in circumference. Even a pine tree eight feet in circumference is no insignificant specimen, but an apple tree of that size is a monster.

THE *Lumber World* says :—Locust timber is one of the very valuable of Southern woods. For certain uses in ship building it has no equal. Where strength and durability are required, its value is acknowledged. Fence posts made of it have been known to be in the ground for sixty years and remain perfectly sound. The tree is a beautiful one, and grows very rapidly, hence its special adaptability to artificial culture. The Southern states are not yet much in need of timber cultivation, but the locust will flourish in other less favoured portions of the country, as well.

THE Ottawa Board of works has decided to authorize City Engineer Surtees to call for tenders for tree-planting and boulevarding in the public streets.

IT has been demonstrated from a scientific standpoint that the greater portion of Switzerland would have been uninhabitable years ago were it not for the systematic cultivation and preservation of forests, which are cared for as strictly almost as a private park.

A CORRESPONDENT of the London *Timber Trades Journal* writing from Alexandria, Egypt, says the stocks of Swedish wood there are large, and as the merchants foresee that some time must elapse before building to any extent is commenced, they are not at present inclined to increase them.

THE *Northwestern Lumberman* says :—The cry that mahogany is rapidly superseding, and will take the place of, our native woods for furniture, need not scare anyone who owns hardwood lumber piles or timber. Distribute all the mahogany that comes to America in a year among the furniture factories, and every man who buys a piece of furniture might be able to get a small sliver of it, but hardly more.

THE Winnipeg *Commercial* says :—R. J. Short expects that his new saw-mill between Rat Portage and Keewatin will be ready for occupancy by the beginning of June. The output of lumber this year will be about 8,000,000 feet. He has also taken out 185,000 ties, 10,000 telegraph poles and 5,000 piles. He is also putting a tug on the lake to do his own towing. This will be ready for work by the opening of navigation.

AN Illinois correspondent of the *Northwestern Lumberman* says :—This is about the time that people begin to "trot out" their big logs. I can start the racket with a black walnut seven feet eight inches in diameter across the stump and 12 feet long ; and the mystery of it is how it came to grow perfectly sound. It is as sound as a "trade sheckel." I've got six others nearly as large, and the seven logs hold two flat cars pretty close to the track.

THE *Timber Trades Journal* says :—If the depletion of the forests of the Northwestern States of the Union is as imminent as some statisticians try to make us believe, the abolition of the duty presents a grand opportunity of saving their own trees by using those of their neighbors. Unfortunately Canada was said to be in the same plight, and pine was getting quite a scarce commodity. Still the world goes on, and plenty of it comes forward.

THE *Lumberman's Gazette* says :—The state of New York at present only owns a trifle over six hundred thousand acres of timbered land in the Adirondack region ; hence the interference of the legislature of that state for its preservation comes none too soon. This action has been necessitated to prevent the floods on the Hudson river in the spring and fall, and exceedingly low water in mid-summer, which already seriously impede navigation at Troy, Albany, and other localities between the latter city and Poughkeepsie.

OWING to the rush of high water in the Rideau, the stone foundation of McClymont & Co.'s new mill office, in course of erection on the bank, was loosened. The latter occured to such an extent that it was deemed necessary to tear down the whole structure. This was proceeded with, and the firm will be put to a lot of additional expense in reconstruction as soon as the water has receded far enough. Among the places flooded in the village of New Edinburgh are McClymont & Co.'s mill yard, and Mr. Alex. Lumsden's boathouse and wharf. The damage to both places will amount to about $200.

A GENTLEMAN recently from Dakota, tells the *Northwestern Lumberman* that there is a deplorable lack of lumber in some of the new towns springing up in the territory. The embargo during January and February prevented the shipment of lumber, and since then the requirements of the settlers have been so urgent that little beside their goods and stocks have been transported. Common lumber sells at $18 per thousand, with a dozen buyers for every board there is for sale. At many points household goods are sitting by the railway track, with no material to make houses to shelter them or their owners.

Lumber Drivers' Calks

For Use in Stream Driving to insure a safe footing in Slippery Places.

25 in ball and 5 in heel are the numbers usually required.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,

C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1YL7

British Columbia.

In his evidence before the Committee on Immigration, Dr. Dawson, Assistant Director of the Geographical Survey of Canada, said :—

"The Queen Charlotte Islands contain about 70,000 acres of excellent agricultural lands, covered with heavy forest timber. The yield of wheat per acre on Vancouver Island is from 35 to 40 bushels. The whole seaboard and a large portion of the interior have abundance of timber for commercial purposes, the largest and most generally used being the Douglas pine, which attains an ordinary height of over 300 feet and a diameter of 8½ feet. White pine of an excellent quality abounds, while the spruce and hemlock are very superior in quality to what they are on the Atlantic coast. The forests have not suffered by fires owing to the humidity of the climate. The leading resources of the Province in order of importance, are timber, fisheries, mines and agriculture."

Lumber in the East.

A Portland, Me., despatch of April 10 says a meeting was on that day held by prominent lumbermen of Maine, New Hampshire, Vermont and Rhode Island, representing 250,000,000 feet of lumber, a protective association was formed and a committee was appointed to draw up a schedule of prices for the coming season. It was developed that less spruce lumber has been cut during the winter than was expected, and that the amount expended for labor and teams was higher than usual. It was decided to keep prices at about last season's figures. This combination controls the spruce market. Another telegram says the lumber dealers of New England propose to raise the price of building lumber $1 per thousand.—*Northwestern Lumberman.*

A Warning.

The time has come when the refuse of the logging camp begins to dry and get ready to be converted into fierce flames, provided some hunter, explorer, or thoughtless boy, drops a lighted match. Every operator knows this, yet what will he do about it? Simply nothing. He will not sweep together and dispose of the powder that all the summer and fall will be a standing menace to his own, and his neighbor's safety. He will not expend a single dollar for insurance. He will depend on big rainstorms and Providence, and if these fail him, he will go around grumbling as usual because there are not laws enacted to force him to do what he knows he ought to do. A single forest fire may sweep away property that is worth millions, but no precaution is taken to avoid it. The saws of the mills of the Northwest will dispose of the pine fast enough without the assistance of forest fires. When the final summing up comes we fear that more carelessness will be charged up to the logger's account than he can stand.—*Northwestern Lumberman.*

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cuttiug teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry aud diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, aud gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

Market Reports.

MONTREAL.

From Our Own Correspondent.

APRIL 25.—Business has been quiet lately and sales have been rather light, as buyers are awaiting the opening of navigation in order to make purchases ex vessel. It is expected that about the same amount of building will be done this season as was done in the last. Prices have not varied much as yet. Last season's rates still rule, except for laths which are now worth $3.00 per M. and scarcely any to be had at that figure; last summer they were sold at a $1.35. The supply of ash is very light, and for which there is a good demand. Other hard woods are in fair demand in a retail way. We quote ex yard as under.

Pine, 1st quality, ₩ M	$35 00@40 00
P ne, 2nd " ₩ M	22 00@24 00
Pine, shipping culls, ₩ M	14 00@16 00

SHIPMENTS AND FREIGHT.

It is rather too early in the season to say much about shipments. It is roported that contracts have been entered into at Quebec for delivery in the River Platte of about 5,000,000 feet of spruce lumber to be shipped from here and Three Rivers. We have been unable as yet to ascertain the rate of freight; steamer room, from hence to Liverpool, for deals has been offered at 60s.

LIVERPOOL MARKETS.

Owing to the frost and severe weather during the month of March business has been quiet. At the last auction sales of spruce deals an advance in price was obtained, but not so much as was generally looked for. Two cargoes from St. John, N. B., were sold averaging £7 9s. 6d. and £7 11s. 3d.

CORDWOOD.

The demand during the past week has been pretty lively owing to the cold weather. The supply is good at the railway station, but at the moment there is a lull in the imports, as the ground in the country is too wet to cart the wood to the cars. Owing to liberal receipts and the near approach of the opening of navigation, the market is easy and prices lower with a falling tendency. We quote ex cartage:

Long Maple	$ 6 50
Short "	6 00
Long Birch	5 50
Short "	5 00
Long Beech	5 00
Short "	4 75
Long Tamarack	4 50
Short "	4 00

OTTAWA.

From Our own Correspondent.

ARPIL, 24.—The Grand Union hotel was besieged with lumber merchants this afternoon, when a number of valuable timber limits were put up at auction by the Merchants Bank of Canada. The berths were known as numbers 23, 43, and 51, the area of each being 36 square miles. Amongst the more prominent lumber kings noticed, were Messrs. David Moore, R. Klock, D. A. Macdonald, of Ausable, Michigan, J. McKay, Renfrew, J. Bell, Pembroke, J. McCann, Wm. Hurdman. Wm. Conroy, Aylmer, J. Rochester and other local mill and limit owners. There were also present a number of bankers. Berths 43 and 51 Georgian Bay were offered in one parcel. The bank officials could give no report on these berths and consequently no intelligent idea of the value could be formed; they were therefore withdrawn, not before, however, $5,000 had been bid. The other number 23, one of the most valuable limits now in the market, was next offered. The situation of this berth is on what is known as the Widow river. The C. P. Railway passes through it and this has consequently enhanced its value, as it affords facilities for shipping by rail. Competent judges estimate that it will give 400,000 square feet of lumber. The bidding started at $25,000 and kept lively until the sum of $56,000 was reached. The bank here withdrew its reserved bid and the berth was knocked down to a city gentleman representing Mr. Klock of Aylmer. Not a great many years ago this berth could have been purchased for less than one-tenth the amount received to-day.

THE PAST SEASON.

Shanty foremen and others interested in the trade, who return from the Upper Ottawa, report the past season to be a very successful one in lumbering operations. The snow kept at a good height. There was no scarcity of labor and as a result the output of timber will be fully as large as last year. Nearly all the shanties have by this time broken up and everything is in readiness for the spring drive. Every train from the east during a short time past has had on board large gangs of river men, *en route* for the shanties to bring down timber.

Ald. Whelan, manager for Mr, J. Rochester, to-day stated that lumbermen entertain some fear that the water in the rivers and streams this spring would not reach that height that would be desired, but thero is no danger, however, but that the bulk of the timber will be navigated down to the mills and markets. The weather this spring for tho most part has been warm in the day timo and cold at night and consequently the snow has greatly run off.

SAW MILLS.

The repairs to the saw mills here which have been carried on during the winter are about completed, and it is expected that the majority of them will start their saws in motion for the season next week. This is a littlo earlior than usual, but there is a sufficient supply of logs in the ponds to keep them going until the fresh ones come down. Owing to the somewhat depressed condition of the market, it is believed that many of the mills will not run at night.

A HANDSOME MILL.

Mr. E. B. Eddy's new mill, erocted on the site of the onc destroyed in the large conflgration last fall, has been completed and is pronounced one of the most handsome structures of the kind in the Dominion. The walls are of stone, and largo, substantial timbors have been used in the fitting up of tho interior. The roof is oval in shape, different to all the other mills here. The exterior of the mill has been painted in flashing colors and presents a handsome appearance. The latest improved machinery has been put in and the sawing capacity will be larger than the previous one. which cut nearly 80,000,000 feet last season. This new mill will be the first to start in this vicinity, beginning on Monday next.

NEW VESSELS.

Three years ago not a steamer of any dimension could be seen on Lake Temiscamingue. Since that time a small fleet has been placed on it by different parties. Mr. Allen Grant is now building another schooner to ply on the same water this season for freighting purposes.

TORONTO.

From Our Own Correspondent.

APRIL 23.—Trade by carload is dull at present; owing to the tardiness of building operations this spring the yards are holding larger stocks than is usual at the opening of the season. The winter of 1881-2 continued so open that building went on with little diminution during the ontire year, and, as a consequence, retailers found their yards nearly depleted on the opening of the summer. This state of affairs is now entirely reversed, wholesale dealers have continued shipping to this market nearly through the entire winter, and retailers continued purchasing, and now find themselves with full stocks, and wholesale men find it difficult and up hill work to sell on the local market. This glut will, however, be only temporary, and with the advent of fine weather and good roads business will once more resume its wonted activity. I would here remark that there is no overstock in dimension bill stuff, that is still difficult to obtain in sufficient quantities to meet present demands. The surplus is mainly in stock boards and sidings; 2x4 scantling, 12 ft. to 20 ft., and joisting 18 ft. to 24 ft., is still in demand, and no glut in the shingle or lath trade. Mill men seem to have devoted their entire attention to the wants of the American market, which is mainly confined, so far as trade from here is concerned, to strips, stocks and good sidings, 1 in., 1¼ in., 1½ in., 2 & 3 in.

The docks have now their wonted signs of activity and bustle. Four vessels have left for Oswego up to time of writing this letter, taking away with them over 100,000 feet of lumber, and the diffierent railroad companies will soon be taxed to furnish cars to meet the wants of their customers; indeed the Midland Railway Company are now employing their box cars in the lumber trade, and it is difficult to obtain G. T. R. cars sufficient to meet the demand of the western trade, as all the lumber shipped over the Midland railway for points west of this place have to be transferred to the G. T. R. cars on their arrival here. This is extremely inconvenient for shippers on account of the delay and extra expense involved by handling. But the Midland Company excuse themselves on the plea that they have not sufficient rolling stock to allow their cars being sent so far from their own jurisdiction. The same excuses are made by the different railroad companies from year to year, and no apparent steps taken to remedy the evil, although credit must be given to the Midland Company for the exertions made by their officials to forward the lumber over their road as rapidly as possible.

Prices at the yards remain the same as last quoted you, and no downward tendency to be noted.

OSWEGO. N. Y.

From Our Own Correspondent.

The demand since our last has been very slack; buyers are holding off in anticipation of lower prices when lake and canals navigation get fairly opened. We have had only one arrival of lumber so far; stato canal will be very late opening this season; the weather is too cold to admit of work being done speedily. No change in prices.

CHICAGO.

The *Northwestern Lumberman* of April 21, says:—Probably the amount of lumber actually called for on country orders since April 1 has not been as large as for a corresponding timo in March, though the quantity shipped thus far this month does not fall below the average in March. There is much diversity of opinion in the district about the current demand, some asserting that it has seriously fallen off since the first of April, while others report a brisk demand fully as good as in March, which all acknowledge to have been a month of heavy trade. It is noticeable that the jobbers take the gloomier view of the situation, while the manufacturing dealers express great satisfaction about the volume of business doing, and predict great things for the future. Setting aside the views of both wings of the trade, we have sufficient testimony of facts to prove that the demand for lumber is good, and that the current outward movement is fully as heavy, and probably heavier than it was last year at this time. Several houses, whose veracity is unquestionable, report a larger aggregate shipment this month thus far than in April 1882, and they are among the largest shippers in the district. While some of the jobbers may be passing through a period of dullness as respects their individual yards, others of the same wing of the trade are having all they can do to keep up with their orders. It is a fact that several houses that are to remove their yards have been able to almost entirely clean off their foundations, and will not be obliged to wagon a stick to their new locations. When such a thing as that can be done, even at a moderate concession in prices, it shows what might safely be called a sweeping demand, for it has been capable of performing thorough broom work in a number of yards. It is furthermore noticeable that all over the district the sky is breaking in, where, as late as February, the tall piles obscured the vision. An immense depreciation in the amount stock has taken place since March 1, as anybody can see who is familiar with the district. Several of the larger houses report shipments this year up to the present as considerably in excess of a like period last year. On the whole, wo may conclude that the season has started out well for the lumber business, and that the requirement for the entire year will be considerable more than for any previous one in the history of the Chicago lumber trade.

BOSTON.

Cotton, Wool and Iron of April 21, says:—There is a fair steady demand for general lumber, and the tone of the market is quite well sustained, with a continued good outlook for business. Pine holds its own both for western and Canada. Yellow pine is in good demand. Spruce is in request, with the mills in Maine and New Hampshire very busy on orders. The

trade in hardwoods holds along about even, with a fair demand and steady prices on choice aud desirable lots.

GLASGOW.

The *Timber Trades Journal* of April 7, says: The quantities on hand at present, of the various descriptions of wood goods, are comparatively moderate. The consumption of Quebec log timber during the past three months amounts to about 13,000 logs pine and 3,500 logs oak, elm, and birch, which as compared with corresponding period last year shows an increase in pine of about 3,500 logs, and in hardwoods a decrease of 1,600 logs.

The quarter's consumption of pitch pine apparently amounts to 7,600 logs, and the import during same period has been three cargoes—3,033 logs. There is still a considerable stock on hand. The stock of Quebec yellow pine deals consists principally of 3rd quality, the quantity of 1st quality being comparatively small.

AUCTION SALES.

On 3rd inst., at Glasgow, Messrs. Farnworth & Jardine, of Liverpool, brokers:—

A cargo of Mexican (Minatitlan) mahogany, consisting of 365 logs, msg. 06,794 sale feet (the import of Messrs. R. B. Watson & Co., merchants, sold at an average of 7 9-32d. per foot prices ranging from 5½d. to 1s. 2d.

Messrs. Singleton, Dunn & Co., thereafter sold by auction the undernoted deals, &c.:

Quebec 1st yellow pine deals—
12 ft. 11×3 2s. 8d. & 2s. 8½d. per c. ft.
12 " 10×3 2s. 6d. "
12 " 9×3 2s. 5½d. "
12 " 8×3 2s. 4d. "
" 2nd spruce deals—
9 to 11 ft. 10/16×3 } 11d.
15 & 16 " 9×3 }
20 logs chestnut (473 cub. ft.,) 1s. 5d. "
8 logs hickory (450 ") 1s. 9d. "
Oak planks 11 to 21½ ft. 12×5 at 2s. 0½d. "

Following the above Messrs. Edmiston & Mitchells sold a parcel of 75 American black walnut (17¾ in. av. square), at 5s. 1d. to 7s. averaging 5s. 11d. per cub. ft. also 17 logs at an average of 5s. 9d. per c. ft.

LONDON.

The *Timber Trades Journal* of April 7, says: We hear of no sales of magnitude having been done as yet in first open water goods, but we understand these have been distributed to a considerable extent amongst coast buyers in a quiet way that betrays there is rather more business doing than appears on the surface—a sort of undercurrent of activity, which will show its effect on stocks later on, when we shall probably find that shippers have not been having such a quiet time as circumstances led us to imagine. Gefle prices have undergone little or no alteration; but whether this had reference to the best class of goods, or was only on inferior shipments, we are not in a position to say. The probabilities are that it was for a modified specification, or upon goods with a second rate character that the concessions referred to would be made, it being hardly likely, in the face of the determination come to amongst the leading producers to cease forest operations, and which has already been put into effect, that the best Sundswall or Soderham houses would, without some general consent, lower their prices, while those at Gefle were so firm.

Of course it depends entirely on the state of the trade here whether values will be maintained or not; already we hear accounts of improvement, and in several directions the dulness so universal in most branches has been stimulated by the fine dry weather of the past few weeks, which is now having the expected effect on outdoor operations: these are now beginning to show signs of real activity, and the next fortnight will probably decide the tone of the market in respect to cargo prices, at any rate, for the spring shipments.

LIVERPOOL.

The *Timber Trades Journal* of April 7, says: The past week has been a quiet one so far as the amount of business done in sales to the country is concerned, the demand having fallen off in nearly every article. This a state of matters somewhat unexpected, as most people recently were of opinion that, with the easy condition of the money market and the favorable turn in the change of the weather, building operations would exhibit much more animation, and consequently there would be a corresponding degree of liveliness in the timber trade. These anticipations, however, have not only not been borne out by the course of events, but the reverse has occurred, and this too in the face of moderate stocks of nearly all kinds of building timber. With the exception of Norwegian prepared flooring, of which ample supplies have come forward freely, the stocks on the spot are much upon the same footing as those of last year, which were regarded as being light.

In addition to this, the continued scarcity of sailing tonnage is making itself felt more acutely every day, and owners of vessels are holding out for advanced rates of freight, especially from the pitch pine ports and from Canada—in fact, greatly enhanced rates have been paid for the former; but though some advance has been made in sales on a cost, freight and insurance basis, it has not been equivalent to the increased cost to the shipper.

The price of spruce deals does not advance as one would naturally expect it to do looking at the moderate stock held in first hands in Liverpool, nor does there appear to be any strength in the demand from the country districts and large manufacturing centres.

On Wednesday Messrs. Farnworth & Jardine offered a cargo of St. John, N. B., deals, &c., say about seven hundred St. Petersburg standards, but about one-third was withdrawn, as the auctioneer declined to sell at the prices bid for some of the sizes. The chief buyers were the local merchants, though a few lots were knocked down to bidders from adjacent towns. The prices realized were for—

The Northwest Trade.

The newspapers of Monitoba latterly mention that building has begun early, and is being prosecuted with much vigor in all the towns of the province. The prospect is that this season will be unprecedented for building in the Canadian Northwest, both in the towns and on farms. Immigration is large, and promises to increase as the season advances, while railroad building will be actively carried on. Though the Lake of the Woods district and the Selkirk mills will supply a large portion of the demand, and considerable lumber will no doubt go over the Lake Superior and Canadian Pacific route from Georgian Bay, yet it is hardly possible that the supply will be ample and continuous enough without a supplement from the American side. It is probable that Minneapolis, Duluth and Northern Wisconsin mills will this year contribute to the aggregate of lumber that will be needed in Manitoba and the Northwest territories.—*Northwestern Lumberman.*

Wholesale Lumber & Timber Dealers

39 Broadway, NEW YORK.

Oak, Ash, Cherry, Black Walnut, Poplar, Butternut

And all other Kinds of HARDWOOD LUMBER.

White and Yellow Pine Lumber and Timber.

Oak Ship Plank and Timber. Pine Deck Plank and Ship Stock Generally.

L7

CHERRY has pretty well superseded black walnut for fine house finishings, and now another rather neglected wood is coming to the front. This is cedar. Cedar land all over the country is looking up and becoming more valuable. The demand for cedar has increased in value enormously within a few years.

THE export of white pine from New York for the first three months of the present year has been larger than for several years. Although it is at present reported dull, there is a healthy movement, and that with a good volume. When a falling off follows marked activity, dealers are ready to call it dull.

MR. J. D. SILCOX, contractor for the new dry dock, Collingwood, to the construction of which the town gave $25,000, has resumed the work with good prospects of an early completion. Large gangs of men, teams and masons are at work, and every effort will be made to have the dock ready for business by the 10th of May next. When completed this dock will be the best on the lake. It is 320 feet long by 60 feet wide, has a gate entrance of 50 feet in width, has a depth of 14 feet over the mitre sills. Its bottom timbers will be laid on a rock foundation; it is located in the inner harbor and is easy of access.

A CORRESPONDENT of an exchange thinks it unnecessary to have three boxes for the arbors of circular mills. His experience has taught him that three boxes are a nuisance; that the connecting piece between the boxes is apt to come in the way of the driving belt and have to be cut away. The less complicated a machine the better, and two boxes, if they are good long ones, are all that is necessary. The writer thinks the bearing for an arbor carrying 50-inch to 60-inch saws should not be less than 12 inches long. He adds: "A great deal of machinery is ruined by neglect, by letting the bearings get dry, bolts getting loose, and left to run in this condition until it is past care, where one moment's attention in time would have saved the whole."

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

ASH & ROBBINS,

20L24 **360 Fulton Street, Brooklyn, N. Y.**

THE *Lumberman's Gazette* says:—As an indication of what some of the up river operators are doing in the line of hardwood, we note the fact that R. J. Birney & Co., of Saginaw City, have purchased during the winter something over 2,000,000 feet of hardwood logs, of which three-fourths are ash and the balance white maple, basswood and rock elm. They have purchased also some very choice cedar logs, which will be manufactured into boat stuff and shingles. The logs will be manufactured at the Briggs mill on the middle peninsula, between between Saginaw and East Saginaw.

THE *Insurance and Real Estate Society* says that Prince Arthur's Lauding is an excellent point for the manufacture of lumber for the North-West; already Mr. Thomas Marks has erected a large saw mill at the south end of the O'Brien property, and several other saw mills, plauing mills, sash and door factories are contemplated. Lumber can be made here for the Winnipeg market far more advantageously than in the States, as the duty is avoided and the freight is much less. Business in this line can be extended indifinitely, as manufacturing of houses in sections, of furuiture, and all kinds of wooden-ware would be most profitable.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

THE KEY TO HEALTH.

The import during the month (save one item, prepared flooring) has been small, and helps to strengthen the market, which has been weak and languid all the year. Latterly a better feeling has taken place, and now that the holidays are over and fine seasonable weather prevailing, a more encouraging state of things should be exhibited in the general trade of the country, and the wood trade may then fairly look for an improvement, especially as stocks cannot be considered otherwise than very moderate. The plentiful supply of money and the continued low rate of discount, 3 per cent., does not augur much demand for trade purposes. Freights are much the same as last month, although an increased demand would quickly advance rates.

COLONIAL WOODS.—Yellow pine timber: The sales have been small, all from the yard, and of a retail character. Around the coast contracts have been made more freely. Red pine has been in fair demand. Ash: No sales reported. Elm: The stock is light. Walnut: The stock is light of Canadian, and good large wood commands full prices. Birch maintains its value, and the stock is the smallest for some time past. Oak: The stock is light, with a fair demand, especially for planks, cut to sizes; the sales have been of the latter, at 2s. 9d. per foot for prime, and 2s. 1d. to 2s. 3d. for inferior quality anc specifications A cargo is now landing and not yet sold. N. B. and N. S. spruce deals: There have been no fresh arrivals; a cargo of Nova Scotia, to arrive, has been sold at £7 5s. c. i. f. to an outport. The consumption here has been rather below that of the same time last year, and the stock is larger than last year's, which was unusually light as compared with former years. The only sales have been at auction of St. John, viz, ex-Governor Langdon, averaging £7 11s. 3d., and ex-Marabout, at £7 10s., ex quay, which shows a slight improvement. Quebec pine deals: The stock is being reduced, there has been an increased demand, and full prices obtained. By auction, a few 1st quality Three Rivers, 3x10, realized £21 per standard, and 2nd quality, long lengths, 3x11, £17 per standard; a parcel of 3rd quality has also been sold, the price of which has not transpired. Quebec staves: Pipe have changed hands at £95, and puncheon at from £23 10s. to £25 per mille. Palings and laths are asked for.

PAPER AND ITS USES.

The great diversity of uses to which paper pulp has been heretofore put has prepared us for almost any statement in regard to its application. We have been informed of paper boxes, paper barrels, and boots; paper floors, ceilings and siding, paper car wheels and rails; and paper dishes, pails, and other furniture that were hardly prepared for the statement that paper chimney shafts were among the possibilities of this almost universally applied material: Perhaps says an English exchange there never was before in the history of mankind so outrageous a violation of preconceived ideas as is embodied in the sentence, "Paper Chimney Shafts." The name is sufficient for a tolerable joke, yet in Breslau a shaft has been erected fifty feet high of paper pulp which has been chemically impregnated so as to resist combustion. Paper has been put to some extraordinary purposes, but we think the use of paper for chimney shafts surpasses all."

The limit to which paper pulp may be used in the various industries has by no means been reached. For several years the most expensive and safest car wheel has been made of this material, using a steel tire. Houses are being built on western prairies of "lumber" made of straw pulp. Railroad bars of the same material are seriously proposed, and now comes along a lively German scientist and makes the stuff fire-proof, and build a chimney of it. Next came ovens, heating furnaces, stoves. Should this development proceed as alll others, it will materially effect the iron trade. The materials for paper pulp—worthless woods and straw—are most abundant and cheap. The limit to its use could hardly be affected by the lack of stuff to make it.

Stocks in England.

The *Timber Trades Journal* says:—All colonial goods continue less in stock now than they were a year ago at similar date, and this state of things will probably remain till the first open-water cargoes put in an appearance, which is not likely to occur for some considerablo time yet. The same with regard to pitch pine; stocks are still light, being about 17,000 pieces, against 45,000 last year. The stock of prepared boards, including the recently arrived cargoes, a portion of which have not been taken into stock, does not come up the stock in hand last year by about 400,000 pieces, a not very considerable difference, and which the next returns will probably more than make up. The open winter 1881 and 1882 kept the stocks of flooring from diminishing to any considerable extent during the dead season, but though this winter has been far from a severe one, still there was sufficient frost in the Baltic to close the ports at the usual time, and thus check the importation to this country.

Pliable Wood.

The London *Timber Trades Journal* in its account of the recent Building Trades Exhibition, describes the following as among the curiosities:—There is the Pliable Wood Company, whose stand is deserving a passing notice. They put a card into your hand, with their address printed on it, which is a pure veneer, tougher than pasteboard but with the color and grain of the wood plainly showing, and which is flexible without splitting or cracking. Rather a curiosity than an eligible visiting card, perhaps, but showing to what uses wood can be turned in case of need. They claim too that their process is *indestructible by fire*—that is, it may be assumed, not liable to take fire by anything short of a welding heat. All their preparations of wood take a high French polish; and they exhibit specially pressed match boarding, of various woods, for ceilings, partitions, passages, stairs, &c., rendering lath and plaster unnecessary.

IN a recent sitting of the German Parliament the Bill for raising the wood duties was referred to a committee by 136 votes to 135.

THE *Timber Trades Journal* of March 31, says:—It is satisfactory to see that prices have been so well maintained in the north. The sales at Glasgow and at Leith last week indicated considerable firmness in the market, as nothing appeared to be sacrificed, and some goods fetched romunerative prices. Sixty feet avorage Quebec yellow pine timber averaging over 85s. per load must be considered a fair sale; but 3rd Quebec yellow deals at about £9 for regular sizes was not so good. Pitch pine, while pulling down the prices of the old favorites, does not do much for the importer even in Glasgow. 1s. 4d. per foot is equal to 66s. 8d. per load; from this deduct 42s. freight, and 21s. first cost; there is 3s. 8d. left to pay insurance, landing charges, dock dues, auction fees, discount, &c., before the importer can look for a margin. In Liverpool this commodity is doing rather better just now. There is a large demand, but the supply is too incessant to admit of any material advance of price.

LUMBERING BY LIGHTNING.

THE *Northwestern Lumberman* says:—The part that electricity will play in the lumber business is a thing unknown. At present it cuts no figure except for lighting mills; but with its unlimited possibilities, its use may be much more extended. Just now electric motors are commanding attention. It is claimed that the cost of such a motor is small in comparison with steam engines, and that they can be made to weigh considerably less than the common engine. Perhaps a light motor may be just the thing for the logger to haul logs over a light track. Felling trees by electricity has been tried, and although it did not prove a success, there is no reason to despair. That logs will be cut and hauled by electric apparatus is not improbable, and no one can say that electricity will not yet be the power that will run saw mills. In fact, the day may come when a good share of the lumber business will be run "by lightning."

Railway Freights.

The *Northwestern Lumberman* says:—There is a growing feeling in Mississippi that the legislature should take in hand railway matters, and seek to equalize the freight rates. It is thought that an effort will be made to that end at the coming session of the legislature. If by any means the lumbermen along the lines of railroads could ship their common lumber it would be greatly to their advantage. As it is now, millions of feet of such lumber are piled at the mills, with the probability that it will lie there until it rots. A mill man recently offered 1,000,000 feet to a gentleman for $3 per thousand, and the offer was not accepted. It would find sale if it could only be shipped. Any quantity of it could be bought at from $3 to $6 dollars per thousand, nearly every mill having 1,000,000 feet or more of it on hand.

A Large Fir Tree.

The following letter appears in the *Timber Trades Journal*:

SIR,—I sometimes see in the *Journal* reference to large or historic trees, and, thinking it may interest some of your readers, I send the following particulars of a large Pinaster I have cut into planks this week. The tree standing was near 100 feet high of measurable timber. The butt length of 21 feet cut three 12 inch planks containing from 60 to 65 feet cube each. Two of them are excellent planks, as clean as 1st yellow pine. The grain of the wood shows rapid growth, the color is bright red throughout. I suppose it would be difficult to match these planks in English-grown wood, the dimensions being 21 ft. x 3 ft., 6 in. x 12 in., all square. —I am, yours truly,

S. SCORET.

Steam Saw-mills, County Wharf, Northam, Southampton, March 22nd, 1883.

A TIMBER raft has gone to pieces in the gale at the mouth of the Edisto River, S. C., and three raft tenders have been drowned.

A LINE of lumber vessels will be put on this season between Thompson, near Manistique, Mich., and Chicago. They will run in the interest of the Delta Lumber Company, whose mills are at Thompson.

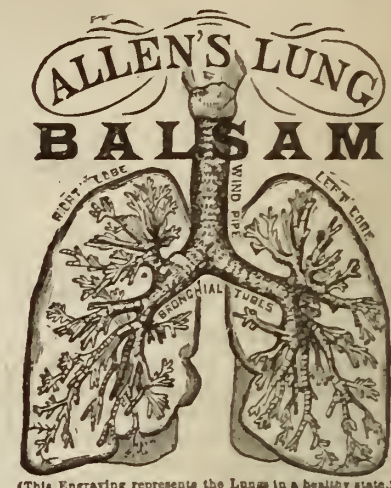
On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

BURDOCK BLOOD BITTERS cures scrofula, erysipelas, salt rheum, piles and all humors of the blood. Cures dyspepsia, liver complaint, biliousness, constipation, dropsy, kidney complaints, headache, nervousness, female weakness and general debility, when used in time.

HEADACHE.—Headache is one of those distressing complaints that depends upon nervous irritation, bad circulation, or a disordered state of the stomach, liver, bowels, etc. The editor and proprietor of the *Canadian Presbyterian* was cured after years of suffering with headache, and now testifies to the virtue of Burdock Blood Bitters.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably. Address TRUE & Co., Augusta, Maine.



(This Engraving represents the Lungs in a healthy state.)

THE REMEDY FOR CURING

CONSUMPTION, COUGHS,

COLDS, ASTHMA, CROUP,

All Diseases of the Throat, Lungs and Pulmonary Organs.

BY ITS FAITHFUL USE

CONSUMPTION HAS BEEN CURED

When other Remedies and Physicians have failed to effect a cure.

Recommended by PHYSICIANS, MINISTERS AND NURSES. In fact by everybody who has given it a good trial. *It never fails to bring relief.*

As an EXPECTORANT it has no Equal.

It is harmless to the Most Delicate Child.

It contains no OPIUM in any Form.

☞ Directions accompany each bottle.
☞ For sale by all Druggists.

PERRY DAVIS'

VEGETABLE

PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c.

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

BAXTER'S MANDRAKE BITTERS.

THE ONLY VEGETABLE CURE FOR

DYSPEPSIA,

Loss of Appetite,
Indigestion, Sour Stomach,
Habitual Costiveness,
Sick Headache and Biliousness.

Price, 25. per bottle. Sold by all Druggists.

Messrs. H. B. RATHBUN & SON, DESERONTO, Lumber Merchants.

LL

VESSELS PREPARING.

The Toronto *Mail* of April 20, has the following among its shipping notes :

The Dundee is still fitting out. She is going to load lumber in a few days.

The Rutherford has finished unloading, and will take in a lot of lumber, probably, in a day or two.

The Bruno, which sailed on Wednesday, carried square timber, and not deal boards, as was reported for her deck load.

The Sarepta has been fitted up, and is taking in a full load of lumber for Oswego at $1.30. She will run out just as soon as she can, it may be to-day or to-morrow.

The Mulvey is taking in 250,000 feet of lumber at the northern, and will finish up to-day for Oswego. She is run out by her owner, Captain Hall, who says the rate is $1.25.

The tug W. T. Robb, owned by Captain Hall, is being fitted up at the Northern, and will do duty on the rafts now getting ready near her berth. There is little to be done on her but to light the fires.

Captain Maw is putting 290,000 feet of lumber in the Jessie Drummond for Oswego. He will sail to-day, if business does not detain him. He is taking this cargo at a dollar and a quarter and on his next trip will look for more.

The Snowbird is loading lumber at the Northern railway docks, Captain Baird, better known as Andy, still sails her. She has been chartered by Mutton, of Toronto, to carry 100,000 feet of lumber for Oswego, which she takes at $1.30. This is an advance on the opening and is a fair price. A safe voyage and quick return for the little craft is the wish of many.

TIMBER PERMITS.

In the House of Commons on Monday April 23, Mr. McCraney, in moving for a return showing the names of all persons to whom permits have been granted to make timber, ties, telegraph poles and saw logs within the district of Rainy lake and river and Lake of the Woods and tributary streams, from July, 1880, to July, 1882, advocated the system of disposing of timber limits by public auction. He read extracts from newspapers commenting on the Government administration of timber lands, and also a letter in which it was stated that the Government had sold timber limits for $5 per square mile to parties who had resold at $2,000 per square mile.

Sir. Hector Langevin thought the hon. gentleman had acted unfairly in prejudging the case before the Government was permitted to bring down the papers. Not only had he done so, but he proposed to confine this inquiry to two years under the present Government, without extending his investigations into any portion of the time when the late Government were in power. If the papers were to be of any use they should cover the whole period during which the timber licenses had been granted. He, therefore, proposed that the motion be amended so as to call for returns of all permits and licenses granted with territory to date.

Mr. Hesson thought the letter read by the mover of the motion should be laid on the table so that the name of the writer could be made public.

The motion as amended was adopted.—*Mail.*

PATTERN LUMBER.

Says the *Mechanical Engineer* :—"The pine is the tree of the pattern-maker—not any pine tree however. He leaves that of Georgia and Oregon to the carpenter for his heavy framework. The stair-builder or joiner may even find uses for these strong and tough woods. He (the pattern-maker) looks to it that his lumber is soft, light in weight, clear and straight in the grain. A gnarled and knotted stick is an abomination to him, but a straight plank is his delight. His views are met, his wishes fulfilled, in the best selected pine of Michigan. How beautiful the freshly re-sawed planks of this wood appear, in color a very light pink, with a knot seldom seen. Its appearance foretells its quality ; the shavings come long and silky from the truing plane, leaving a surface as glossy as satin. Across the grain it is not refractory, and endways it will cut like cheese. So excellent is the quality of this lumber that pattern-makers demand, and receive it, in all parts of the World, from London, England, to San Francisco. Many kinds of wood are used for patterns ; practically, however, there are but two kinds, hard and soft wood. The question is, when shall we use the one or the other. Pine, or soft wood, is used for large and heavy patterns and for small ones, provided there are no cross-grained part, which from their thickness, or from being unbraced, are unable to stand the process of moulding. Stock patterns, expected to be in use for a number of years, are made of hardwood, to retain the sharpness of their outlines. For very small work hard wood is always to be preferred, because in bringing such work to size and shape, very light cutting has to be performed, and the hand is guided in a measure by the resistance felt in using a tool."

LUMBER FOR MANITOBA.

The following letter appears in the *Mail* :—

SIR,—Our attention has frequently been directed to the small quantities of lumber brought here from Ontario by people moving to this country ; and while one of our firm was at Brandon last week we asked our manager there if he knew how much the lumber was costing when brought from Ontario by the emigrant, and were astonished to learn that it was costing from $3 to $10 per M. more than the current selling prices at the yards at Brandon.

It would seem that the idea has been quite prevalent throughout Ontario and the eastern provinces that the prices charged by merchants in the North-West were exorbitant, *i. e.*, that exorbitant profits were charged, and it seems that no notice has been taken of the keen competition that exists in this country, so keen that merchants find it difficult to get a paying margin of profit, and exorbitant profits are the exception and not the rule.

As lumber is one of the first articles of necessity for the new settler here, we give the prices at present asked by the dealers in lumber at Brandon :—Sheathing boards, $28 ; common boards, $32 ; scantling, 16 ft. long and under, $33 ; drop siding and flooring, $35 and $39 ; shingles, $3.75, $4.50, and $5.50 ; lath, $5.75 ; doors, 2′ 6″ x 6′ 6″ x 1¼″, $2.25 ; 2′ 8″ x 6′ 8″ x 1½″, $2 ; sash, glazed, 8x10, 12 lights, $1.75 ; 10x12, 8 lights, $2 ; 12x24, 4 lights, $2.50 per window ; building paper, tarred or brown, 4½ cents per lb.

The foregoing shows the prices asked for small quantities, and represents about the requirements of the ordinary settler. We shall feel obliged if you will kindly publish this in the columns of your paper, and would also ask you to direct attention to it.

For the accuracy of our statements and responsibility we would refer you to the managers of the Merchants' Bank of Canada and Bank of Ottawa, Winnipeg.

Yours, &c.,

Winnipeg, April 17. BOYD & CROWE.

YOUNGS' POINT.

SHINGLE MILL.—The shingle mill is now in thorough working order. Strong new belts having been put in last week. Mr. W. J. Kearn's intention is to cut first class shingles, and to be second to none in the market ; that is his motto.

THE DRIVES.—Mr. Chalmers intends to send back his foreman and two gangs of men to drive the logs that were cut last winter. Mr. Alex. Wynn goes back to Eel's Lake and brings his logs logs and timber down Eel's Creek into Stony Lake. Mr. P. Cassidy with his gang of men brings out his logs down Jacks Creek into Stony Lake. We wish both foremen lots of water in the creeks, no heads winds, &c.,

LUMBER AT SEA.

The New York correspondent of the *Northwestern Lumberman* says :—Some of the lumber and timber-laden vessels from the south with yellow pine have met with severe gales and narrow escapes from shipwreck. Some quantities of lumber have been lost from the decks, and some of the incoming crafts look as though they had been gone on a Rip Van Winkle voyage. The schooner Seth W. Smith, with lumber, came into the harbor April 9, steered in a highly original manner. A plank had been rigged to be used as a temporary rudder, that important part having been knocked to pieces in a gale, April 3. At that time about one-half the deck-load was washed overboard. She was 11 days on the way from Savannah, and six of those days heavy gales were raging. Other trading vessels have suffered more severely. One with sugar came in last week with the rigging all lacking, as it had been swept away during the storm. The sailors were gald to get to port with their lives, and held a sort of jubilee while being towed up the harbor.

REVIEWS.

THE FORESTS OF ENGLAND.—We have received a very interesting little work "The Forests of England, and the Management of them in bygone times," published by Oliver & Boyd, Edinburgh, and Simpkin, Marshall & Co., London. It is written, or chiefly compiled, by John Croumbie Brown, L. L. D., Professor of Botany in the South African College, Capetown. The author laments the paucity of works on forestry in England as compared with the cartloads of volumes in other languages. This work deals in a very interesting and instructive manner with the subject of the ancient forests of England, chiefly in relation to their history and law, but we are glad to learn that it is likely to be followed by other hand-books on subjects relating to forestry.

THE EDISON LIGHT.—Mr. Thos. Swinyard, of Hamilton, Ont., has published a pamphlet containing testimonials as to the advantages of the Edison Electric Light. These are in the form of answers to a series of questions, and give a very favorable report. They are from such establishments as the New York *Herald* office, and a number of leading mills, factories, hotels, &c. We learn that a charter and patent rights for Canada have been obtained, and we hope that shortly a factory for the construction of the machinery will be added to the other industries of Hamilton.

ON THE INTERCOLONIAL RAILWAY.—A. H. Dixon, of Toronto, has published, for the Intercolonial Railway, a beautiful illustrative work entitled "Pleasant Places by the Shore and in the Forests of Quebec and the Maritime Provinces, *via* the Intercolonial Railway." It is a most artistic production, even the cover being an art gem, and the numerous illustrations are beautifully drawn and engraved. The author, W. Kelly Reynolds, describes in a most attractive manner the beautiful scenery and other leading features of the districts in question. Such a publication should prove a strong inducement to tourists to select this route for their holiday excursions or even for a longer stay.

THE Flint & Pero Marquette is running eight log trains, and hauling about 7,000,000 feet daily. The company has contracts to fill that will keep them busy at this rate until July. A large force of men is work on the Harrison branch extension.

THE *Lumberman's Gazette* says :—Great scarcity of lumber all through Dakota. Common lumber sells at $28 per thousand, with a dozen buyers for every board there is for sale. At many points household goods are sitting by the railroad track, with no material to make houses to shelter them or their owners.

THE Belleville *Ontario* of April 23, says: During the past seven days 47,615 cubic feet of square timber have been loaded at Hastings on Grand Junction cars for Mr. Thos. Buck and brought to this city. During Saturday alone 6,867 cubic feet of this timber were loaded on 13 cars, being an average of 527 5/13 feet per car. This work is done under the supervision of Mr. W. J. Butler, who is a "professional" at the business.

THE Montreal *Gazette* says :—The market has presented no very important changes since our last report, a good local demand existing for hard and soft wood at firm prices. An enquiry also is experienced for pine and several kinds of hardwood on American account. Advices from Winnipeg state that some heavy building contracts have just been concluded, and we hear that some large sales of lumber have been made at $24 to $28 per thousand feet.

THE Menominee Indians, in Shawano county, Wis., last winter banked between 5,000,000 and 6,000,000 feet of logs. The logs put in by them a year ago brought $10 a thousand.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to business, thanks to your wonderful medicine.

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

"GRUNT IT OUT."—The above is an old saw as savage as it is senseless. You can't "grunt out" dyspepsia nor liver complaint, nor nervousness if they once get a hold. They don't remove themselves in that way. To take a few doses of Burdock Blood Bitters is better than "grunting it out." What we can cure let's not endure.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward !

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. VOL. 3. **PETERBOROUGH, ONT., MAY 15, 1883.** **NO. 10.**

Recently a large party of Norwegian wood choppers arrived on the steamship Illinois at Philadelphia. They are under a contract with an extensive firm of Minneapolis to work among the forests of Minnesota.

The contract for supplying lumber to the Montreal Water Works' Department has been awarded, says the *Star*, to Messrs. Henderson, who get $40 per thousand feet for deal, as against $37 last year, and 14 cents per foot as against 11 cents last year for tamarac.

It is stated from Berlin, under date April 13, that the Committee of the German Parliament to which the bill for raising the wood duties was referred has read the Government proposals a first time by 11 against 10 votes, after agreeing to a motion for reducing the tax on timber used in mines and rejecting a proposed decrease in the duty on cask staves.

THE Toronto *Mail* says that about 800,000 feet of square timber will come down the Midland Railway to Toronto this spring, and be rafted in the bay. A large number of cedar piles are being brought down this road, and being cut on land that has never been cut over before, are of a superior quality. These will be used at the new breakwater at the Island.

COSTLY CABINET WOODS.

"The demand for fine wood," said one of the members of a well-known Centre street firm, is "increasing every year. The finest and costliest is French walnut, which, by the way, is not French at all, but is a product of Oriental countries. It grows in Persia, Circassia, and Asia Minor. You have seen it in veneering upon costly furniture, but you probably have no notion how expensive it is, nor how careful we are to prevent waste in its use. Come into our workrooms and I will let you see it in process of cutting."

He led the way into some extensive rooms, where ponderous machinery was revolving and heavy chains rattling. In one room steam rose from cracks in the floor.

"Down there," said the gentleman, "is a pit where we lay large and valuable logs and subject them to the action of steam until they become almost as soft as butter. Then we take them out, fasten them to an iron beam (here he led the way into another room), and this beam revolves around a finely tempered knife, of the same length as the log."

With each revolution, a strip of wood was shaved off smoothly, and laid in piles upon the floor like skins of leather or sheets of paper.

"Every time this beam turns around it moves a fraction of an inch nearer to the knife. The whole apparatus works with extreme precision. No printing press or weaving machine is made with greater nicety. The knife that shaves off the sheets of wood is rigidly immovable, and ground to a razor-like edge. The heavy beam that revolves with its great load of timber is firmness itself, and is regulated like clockwork. The slightest tremor in the beam or knife would break and twist the thin sheets that you see turned off here with the regularity and perfection of nowspapers turned out by the printing press. These sheets are about 1-120 of an inch in thickness, but frequently we shave off veneers as thin as 175 to the inch."

He lifted a corner of one of the long sheets, and it seemed to be about the thickness of ordinary writing paper. The wood was warm and pliable.

"It is only in this condition that this shaving process is possible. When fresh from the steam pit the knife slips easily through it. Were the wood cold and hard, the process would be impossible. Even if the knife could do the work, the sheets would be too britle, and would crumble into small fragments."

"For what purpose are these extremely thin sheets used ?"

"The veneers used upon furniture are, as a rule somewhat thicker than these that we are now turning off. The thinnest veneers are used on picture frames They are as thin as the finest tissue paper, and must be backed with ordinary paper attached with paste to prevent the glue by which they are fastened to the body of the frames from showing through. These veneers are also used to a large extent in the same way that wall paper is used—for covering the walls of rooms. Besides this, there are many other and novel uses to which they are put. A short time ago somebody conceived the idea of having business cards printed upon them, thinking that the novelty of the material would cause people to preserve the cards."

"Do you ever saw logs in such sheets?"

"Sometimes, but rarely, with the more expensive woods. Sawing involves a good deal of waste. For the cheaper woods it is sometimes more desirable, as it is not necessary to go through the steaming process when we use the saw, but there is a great difference in the number of sheets that are turned out in that way. The most that we can get by sawing is twenty-five to the inch."

"What is the value of the French walnut?"

"I have seen it sell as high as $2 a pound. At the Paris Exposition for 1878 one burl was sold for $5,000, and its weight did not exceed 2,200 pounds."

"What is a burl?"

"This is a trade expression, and means the large and tough knots or excrescences like warts that grow upon the trunk of the tree. The French walnut is a small tree, crooked and dwarfed in its growth, that grows, as I have stated, in Asiatic countries. Its value is confined entirely to these curious, tough, and contorted bumps that grow upon it. The trunk itself is of little or no value. You have often noticed the singular grain that French walnut has, if grain you can call it. The fibres and tissues seem to be twisted into the most singular and complicated figures. The intricacy of these figures, combined with their symmetry, is one of the elements that determines the value of the French walnut burl. Color and soundness are other elements of value."

"Does the burl play the same important part in mahogany and other valuable woods that it does in the French walnut?"

"There are rosewood and mahogany burls, but, unlike those of the French walnut, they are of little or no value. In those woods it is the trunk of the tree that is prized, the knots are discarded."

"How do other woods compare in value with the French walnut?"

"Next to French walnut ebony is probably the most valuable. Occasionally a fine piece is found that brings even a better price than the French walnut. Not long ago I saw some that sold for $350 a ton. For a particularly large piece, even $5 a pound might be paid. In ebony the main thing is size. It is difficult to get large pieces that can be used without cutting. Rosewood and mahogany are always in demand. The best mahogany is that of San Domingo. Next come the mahoganies of Cuba, Honduras, Mexico and Africa. There is much less difference in value between different mahoganies and rosewoods than between different specimens of ebony and French walnut. Fair rosewood will sell in the log for 5½ to 7 cents per pound. French walnut can occasionally, if poor, be bought as low as three cents per pound, but the finer burls will sell for hundreds of dollars. Burls worth from $500 to a $1,000 each are not rare. I recently bought one myself for $1,200, and I think I shall make it pan out $3,000. We must be very careful, however in buying these burls. Their value is often greatly lessened by the existence of hollows, sometimes in the very heart of the wood, the result of decay or malformation. These hollow places are filled up by fradulent dealers with a substance that is made to resemble the genuine wood, and they will then sell the burls as sound. Manure, compressed to the requisite degree of harduess, is much used for this purpose. Worse even than this is the practice to which such knaves sometimes resort of placing stones in the hollows to increase the weight, for the burls, as I have already intimated, are sold by the pound. This fraud is liable to cause serious damage to the valuable knives that are used in cutting the veneers."

"How about our native woods? Do you deal much in them?"

"Yes, to some extent; but for choice cabinet work the foreign woods are, of course, more highly prized. Burls in ash and maple, are plentiful and cheap, selling for two to four cents a pound. Black walnut burls command a higher price—ten to twelve cents a pound—but they are getting scarce. Yes, the demand for choice cabinet woods is constantly increasing. In the houses that the wealthy are now putting up, the fine wood work constitutes a large item in the expenditure. Look at these veneers for table covers. These handsome designs and this artistic ornamentation are all mosaic work, made by piercing together small fragments of woods of different colors, or inserting them in the body of a large sheet that constitutes the background. To one not acquainted with this work it would look like a drawing on wood; but turn the sheet over and you see the lines run through. You can get these veneers for fine tables at most any cost. You can get one as low as $25, and you can have designs put together at as high price as you may care to pay."

"Are there many dealers in such woods in the United States?"

"The number is very small, but the business large and the competition keen. One of our firm makes frequent trips to Central America and elsewhere to look for rare specimens of cabinet wood. These trips have their attractions, but they are not infrequently accompanied by hardships and danger."—*N. Y. Sun.*

NEW ENGLAND DEALERS.

The lumber dealers of New England held a meeting at the Falmouth Hotel, Portland, recently, their object being to make uniform living prices for lumber for building purposes. There were present prominent dealers of Maine, New Hampshire, Vermont and New York. It is proposed to raise the price one dollar per thousand. At the evening session the following officers were elected: President, F. A. Pitchie; Vice-President, A. S, Brown, of Whitefield, N. H.; Secretary and Treasurer, David Birnie, Portland, and a board of five directors. A constitution and by-laws were adopted. A reporter, in conversation with one of the heaviest lumber manufacturers, learned the principal reason for calling the present meeting and the results which are expected to be accomplished. The gentlemen state that the past has been a very hard winter, with a great fall of snow; the cost of labor and supplies has been heavier than usual. For these reasons it is said to be a fact that it has cost a dollar a thonsand feet more than it did last winter to get the spruce to the mills. On the other hand the prices of manufactured lumber are lower, if anything, than last year, and less than the manufacturers can afford to sell for this season. During the season so far there has been little demand for building spruce, but there is much building in prospect duriug the summer, and there is every reason to expect a large demand soou.

LUMBERING IN DAKOTA.

The following items come from Grand Forks, Dakota:

Since the opening of the new survey—less than a week—75,000 acres of land have been filed upon at the land office.

Mr. Frank Howard, of Ann Arbor, Mich., is in the city with a view to ascertaining the degree of success that might be anticipated if a $100,000 saw mill were to be erected here. He represents Michigan capitalists and says that he will agree to build a $100,000 saw mill and purchase the logs now offered for sale by W. T. Walker, if the city of Grand Forks will come forward with a $50,000 bonus. It will be necessary to invest at least $500,000 in the enterprise, and Mr. Howard says that he can give the assurance that the work would be commenced at once. He says that Mr. Walker asks twice too much for his logs, and that the reason he (Mr. Walker) doesn't run them down to Winnipeg, as heretofore, is that the Canadian Pacific railroad is interfering with his business.

The Red Lake river is admirably adapted to driving logs. On the east side of the Red Lake is timber to the amount of 8,000,000 to 10,000,000 feet of lumber and on the north side the amount of timber is too great to estimate. The logs offered for sale by Mr. Walker are floated down the Clearwater river, which enters the Red Lake river at Red Lake falls, and come from Mr. Walker's land, which lies between the Whitearth and Red Lake Indian reservations. They are good logs and are guaranteed to average 33½ per cent. of clear lumber.—*Lumberman's Gazette.*

HINTS FOR TRANSPLANTING.

We take the following from the circular of the Quebec Commissioner of Crown Lands in regard to the public Arbor Day:

1. Choose trees for transplanting from the skirts of the woods (as much as possible) where they have not been crowded.

2. Do not take them over eight or ten feet in height, except with very special care.

3. Do not grudge the time necessary for taking them up well, with a good ball.

4. In doing so, try and preserve as many rootlets and radicles as possible, rather than big roots. The success, in planting, depends upon the preservation of those rootlets and radicles (through which the water in the soil and various mineral elements in solution are taken up and conveyed, as food, to the tree.)

5. Be very careful not to allow those rootlets and radicles to dry up; shelter them from the sun and wind the moment they are extracted from the ground, and try and keep them fresh with damp moss or otherwise.

6. Trim up neatly the tap root and all the broken ends of large roots, with a slanting cut of the knife, (it will give more surface for the formation of rootlets.)

7. If the large roots are much shortened in extracting the tree, the branches ought to be somewhat shortened, or the roots may not be able to supply food in sufficient quautity for the head, and the tree will suffer.

8. Make the hole for transplanting wider and deeper than the ball of the tree, and partly refill it with good mellow soil; it will give a better chance to the rootlets and radicles, for an immediate start.

9. Do not allow stagnant water in your plantation; if the soil is liable to get overflown, provide for its drainage.

10. Do not replant the tree any deeper than it originally grew.

11. Turn it to the same points of the compass as it originally stood; it appears a good precaution, and an easy one to take (by means of a compass and a string tied round the tree, with the knot to the north.)

12. Spread the roots, rootlets and radicles carefully, pack up between them with fine mellow earth and water before closing the hole.

13. Stake the tree, two stakes will generally do, place them so that they will steady the tree against the prevailing winds; tie with straw ropes, or surround hard ropes with straw, so as not to injure the bark.

14. Keep the ground free from grass and weeds and prevent it hardening at the foot of the trees.

15. Fence strong enough to keep away cattle.

16. The qualities of the soil in which trees are to be replanted, must be carefully considered in selecting the trees.

For rich, deep, mellow soil, moderately damp, take butternut, oak, elm and black walnut.

Maple and basswood will, of course, do admirably well in such excellent soil, but a soil presenting the same qualities, in a less degree, will give very good results for those two kinds of trees, they are more accommodating.

Ash will do well in cold rather damp compact soil, where maple would not grow.

Tamarac grows well in low wet land, provided the soil is not too compact.

Dry sandy soil ought to be reserved for pine and spruce.

N. B.—The period fixed for "Arbor Day" has been chosen withe regard to deciduous trees. In the Province of Quebec, pine and spruce succeed better when transplanted later, about the beginning of June, when the buds are on the point of opening.

GENERAL REMARKS.

It is generally admitted that the cheapest and safest mode of cultivating forest trees is by sowing their seed.

There will be less check in the growth if the seed can be sown at once where the tree is destined to remain permanently.

But it is not always practicable to do that, ground may not be ready, may not even have been decided upon, &c.

In that case, sow in seed beds and rear up seedlings in nursery.

The season for sowing black walnut, butternut, oak, basswood, sugar maple, acer negundo, is in the fall, the moment the seed is ripe.

Soft maple and elm ripen their seed about the middle of June, and it ought to be sown at once, quite shallow, sheltered from the sun and moistened.

Sow fir tree seed in the spring.

Until the nurseries are sufficiently advanced to provide trees fit for transplanting, get them out of the woods, observing precautions indicated above.

Those who do not wish to sow their own trees can procure seedlings at wonderfully low rates from the nurseries.

THE MANITOBA TRADE.

A correspondent of the *Northwestern Lumberman* writes as follows:—

WINNIPEG, April 18.—The lumber business here is in a demoralized condition, and the prospects for a profitable season's business are not of the best. There are further south of us a number of parties who seem to want to do business for pleasure, not profit. Last year prices were maintained that left a good margin for handling, and very little cutting in prices was done unless on large bills, when some slight concessions were made. The trouble this season arose something in this way: In February the city council advertised for tenders for 1,500,000 feet of plank for sidewalks, to be delivered free on board cars here. Amongst those sent in were Woods & Co.'s, a new firm here, for $24.88 per thousand, and one of J. C. McDonald for Little, Peck & Co., of Duluth, for $24.95. The board of works recommended that the tender of Woods & Co. be accepted, but when it came before the council to be ratified it was referred back to the board. In the meantime McDonald wrote a letter to the council offering to take the lumber off the car and pile it in his yard and deliver it to the city as required. This meant a saving to the city of fully $1 per thousand. His offer was accepted, but the contract was never signed. Within the past week J. R. Sutherland & Co., a local mill firm, offered the city all it wants at $24, and D. E. Spraggan, another local mill man, not to be underbid, offered the same at $24 in his yard, or delivered in any part of the city at $25.25. Last season the city paid for the same grade $30 per thousand, so that this is a very big cut. Joist and scantling, up to 16 feet, sold all last season for $30, but a cut of from $2 to $4 is being made now, and the same all through the list. No. 2 common cannot be placed in yard here for less than $26.50 to $27.50, so that those dealers who have to buy in St. Paul and Duluth will have to sell at a loss. Of course these local mills can sell at these prices, but it cuts the margin very fine. Their logs cost them here $16 per thousand, log measure; but labor is high, and quite a number of logs are lost, so it runs up cost. Later on in the season, when business gets opened up, dealers may see the folly of cutting prices, but as there is a very heavy stock to come from Lake of the Woods region, and this is the only market, they have prospects that are not any too cheering. —*Felix.*

PACIFIC COAST LUMBER INTEREST.

Californians, not content with forcing their way to the front rank as wheat shippers, are beginning to turn their attention to lumber, and are seeking markets where their different varieties of native and Pacific coast wood are likely to be appreciated. Redwood, fir, black walnut, cedar and white pine are available in unlimited quantities, having stood for ages unaccustomed to the assaults of the hardy and persistent woodsman; and it is with a view of introducing these and many other varieties of finishing woods, that capitalists intend entering the field as competitors in eastern and foreign markets. Redwood has been in use here for some time, but builders generally are not fully acquainted with all its merits. It is used for many purposes, rough as well as fancy work. It is lasting, worked up either into shingles or for paneling purposes with a high polish. Recently a shipment was made from San Francisco to Glasgow of Washington Territory red fir, cedar and black walnut, and an assorted cargo of woods followed to London. The scarcity of the lumber supply in many portions of Europe offers an excellent opportunity for Pacific coast shippers, and with their known energy, it would not be a surprise to see, at the expiration of a few years, shipments of lumber making from San Francisco and North Pacific ports to Europe as frequently as wheat goes now. At the present time shippers are not fully posted as to the requirements of European consumption, the cargoes forwarded thus far being of an experimental character, simply with a view of ascertaining the tastes. The ventures made in the way of shipments to Panama and other South Pacific ports, have met with such encouragement, that the trade of Montevideo and Buenos Ayres in white pine is now viewed with some jealousy. Australia is buying largely in the San Francisco market for building purposes, and the demand is rapidly increasing. Canada and the West, keep a good lookout for your trade! or some fine day you may awake to the fact, that instead of a prospective famine in lumber, it may turn out a feast, with a surplus to spare.—*Lumber Trade Review.*

NORTHWESTERN PROSPECTS.

The fact that what is called coarse lumber at Saginaw valley points is selling for from $1 to $1.50 per thousand lower than last fall's figures, while what is called good lumber is reported to be selling fully as high as it did last year, is of some significance. It may be taken to mean that the coarser grades of stock throughout the country that draws a large proportion of its supply from eastern Michigan, must rule lower this season than they did last year, for after the mills start up an advance in the value of general stocks cannot be looked for. The concession already a fact at Saginaw points, and the acknowledgement made in western Michigan that green lumber must sell this year at least 10 per cent. below last season's prices, coupled together, certainly indicate a lower range of values all along the line. The information of a break at Winnipeg, conveyed in a letter printed in this issue, shows that there is a powerful competition for northwestern trade, in which Minneapolis, Duluth, Lake of the Woods and the local mill men of Manitoba are engaged. The antagonistic attitude of the yard trade and the cargo market in this city, and the rivalry between Chicago and Mississippi river points for the Kansas, Nebraska and Colorado business, thrown into the devil's broth with the other difficulties, will help the bears of the trade at large in their schemes. Taking everything into consideration, the outlook is a little dubious for the sticklers for last year's prices. Nothing but an overwhelming demand can stop the tendency to weakness; but we must acknowledge, at the same time, that there is a probability that the demand will come very near the overwhelming. But a relentless competition of sections, and an unprecedented output of lumber, are certain to characterize the season's business, and it is a question as to whether the requirement of lumber will be sufficient to withstand these two adverse influences.—*Northwestern Lumberman.*

A PETRIFIED FOREST.

The visitor to the petrified forest near Corrizo, on the Little Colorado, will begin to see the signs of petrification hours before he reaches the wonder; here and there at almost every step in the road small pieces of detached limbs and larger stumps of trees may be seen almost hidden in the white sand. The road at a distance of ten miles from Corrizo enters an immense basin, the slope being nearly a semi-circle, and this enclosed by high banks of shale and white fine clay. At the entrance of this semi circular basin the exploring party camped and a fire was quickly burning. The meal consisted of bacon, beefsteak and coffee, after partaking of which the party camped for the night. In the morning it only required half an hour's good driving to reach the heart of the immense petrified forest, and then such a wonder met our gaze as no one can ever realize until they make that very trip for themselves.

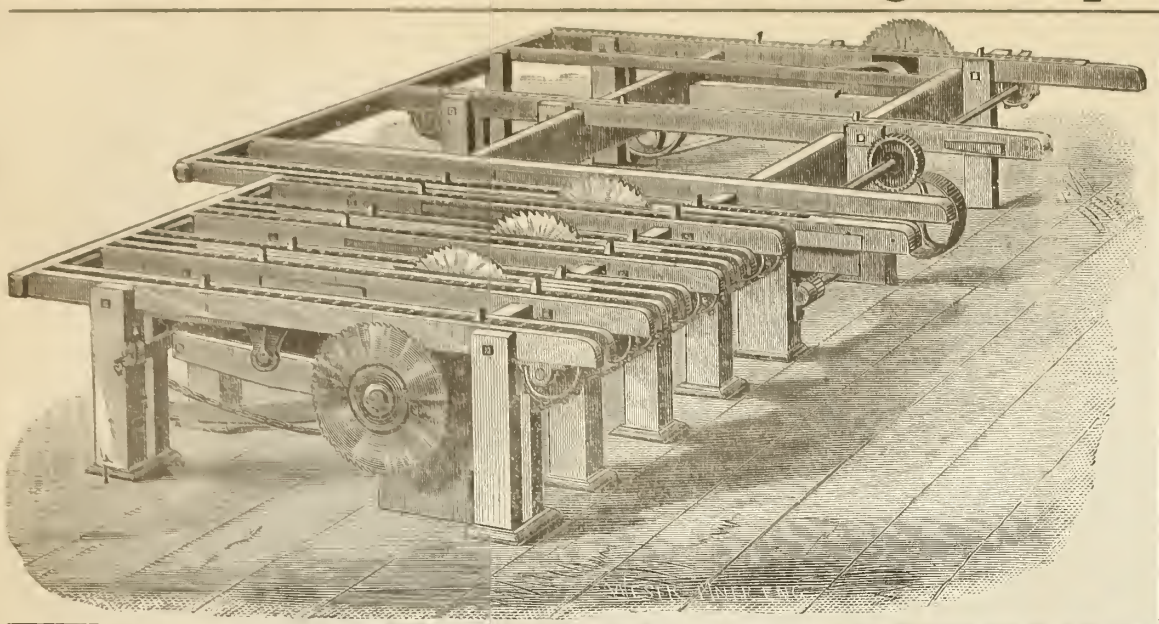
The petrified stumps, limbs, and, in fact whole trees, lie about on all sides, the action of the waters for hundreds of years has gradually washed away the high hills round about, and the trees that once covered the high table lands now lie in the valley beneath. Immense trunks, some of which will measure over five feet in diameter, are broken and scattered over a surface of three hundred acres. Limbs and twigs cover the sand in every direction and the visitor is puzzled as to where he shall begin to gather the beautiful specimens that lie within easy reach. There are numerous blocks or trunks of this petrified wood that have the appearance for all the world of having been just cut down by the woodman's axe, and the chips are thrown around on the ground so that one instinctively picks them up as he would in the log camps of Michigan and Pennsylvania.

Many of the small particles and even the whole heart of some trees have now become thoroughly crystalized and the beautiful colored cubes sparkle in the sunshine like so many diamonds. Every color of the rainbow is duplicated in these crystals, and those of an amethyst color would pass the eye of a novice for a real stone. The grain of the wood is plainly shown in nearly every specimen—making the pieces more beautiful than ever.—*From the Albuquerque Journal.*

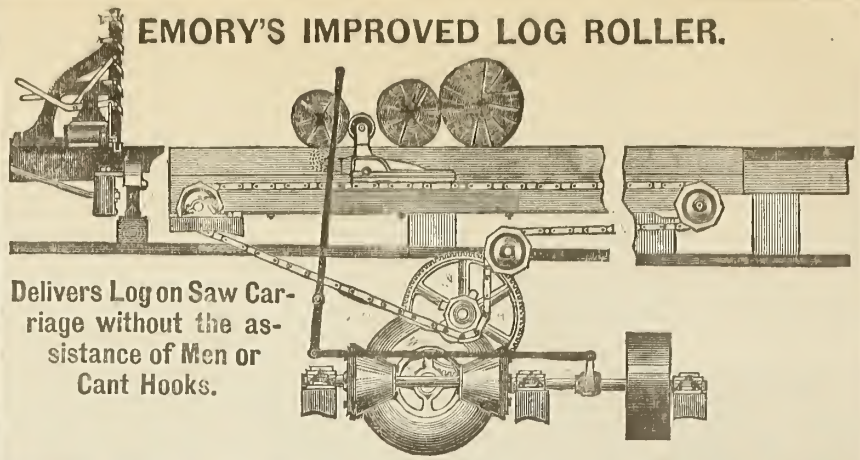
THE *Timber Trades Journal* of London, England, in allusion to the attempted amalgamation of the Grand Trunk and Canadian Pacific Railways says:—"The timber trade will perhaps be better promoted by the separation of these two great lines of railway than by their union. Monopolists are less likely to consult public convenience than those who have to contend with a little wholesome opposition. To facilitate the timber traffic they will have to go on an approximation to the penny postage system, or inland telegraphy, which take no note of distance. From its great bulk, in proportion to value, ordinary timber, like coal, will not bear accumulating charges, by length of way. Our railway companies have not yet recognized this fact, hence the Manchester ship canal."

THE Wiarton *Echo* says:—We are informed that Messrs. Bible and Chisholm are erecting a new saw-mill at Stokes Bay, which will be completed in a few weeks. They are putting in a powerful engine and first-class machinery, which will have a capacity of about 1,500 ties per day. The firm have a contract to supply the W., G. & B. division of the Grand Trunk with 160,000 ties. The settlers of the Peninsula will have no trouble to dispose of their cedar at good rates. At Bible and Chisholm's mill in the Township of Lindsay, on Tuesday, the 10th inst., 1,024 ties were sawn in the short space of ten hours, under the management of Mr. S. Lownsbury, the head sawyer. The ties were all large ones, and no more than two were cut from the same stick. This is extraordinary work, as 500 is considered a day's cutting.

Ewart's Detachable Link Belting and Special Labor Saving Machines for Saw Mills.



EMORY'S IMPROVED LOG ROLLER.



Delivers Log on Saw Carriage without the assistance of Men or Cant Hooks.

NORTH DAKOTA'S LUMBER.

"The lumber interests in northern Dakota did not cut much of a figure till the year 1877, when the tide of immigration set in this direction, said Mr. Shotwell, of Fargo, a few days ago. "The lumber used prior to that time was principally confined to building up the small towns and claim shanties. In 1877 Fargo was then, as now, the prineipal city in northern Dakota, and during the year about 4,000,000 feet were used here. Tho surrounding country consumed about a like quantity. Since that year there has been a steady and large increase in the demand for lumber, both for farm implements and for the building up of towns and villages that have sprung up along the lines of the Northern Pacific and the St. Paul, Minneapolis & Manitoba railroads. It is estimated that in tho year of 1882 Fargo alone used 25,000,000 feet of lumber. A vast quantity was used in other towns toward the west and in the Red river valley. It is impossible to form any sort of an estimate of the quantity used."

"The farmers did not begin to put up substantial permanent buildings in any great number till about the year of 1880. In 1877-8 good buildings were to be found on no farms but the 'bonanza' farms. The proprietors of these had an abundance of money with which to make all the improvements they desired. Since 1880 the smaller farmers have had good crops and have got fair prices for their products, and have been able to add to their buildings from year to year. They have built a better class of houses, barns and granaries than before. And yet, one who rides over the vast prairies of northern Dakota will be impressed with the fact that there are comparatively few farms that are even now well fitted up with buildings. The observer will be struck with the thought that a vast quantity of lumber has yet to be used

"The lumber business in this part of the country is still practically in its infancy. Our supply is obtained mostly along the line of the Northern Pacific as far east as Duluth. In the larger towns of northern Dakota, store buildings are being built to a great extent of brick. There is plenty of brick clay to be met with in different parts of the territory.

"Common lumber is now sold at different points in the valley for from $22 to $28 a thousand feet. Most of the dealers obtain their supplies from the mills along the line of the Northern Pacific road, but some of the larger dealers own their own mills. A lumber business needs some little capital to be carried on profitably and properly. Owing to the lien laws of the territory it is a very safe business to be engagod in. The contractor has a lien upon any building for the amount of his claim as against a third party or any incumbraneers in good faith for 90 days after the completion of the building. He has a lien also against the ownor at any time before the property changes hands. A sub-contractor that is a dealer who furnishes the contractor, has a lien against a building for the full amount of his claim if filed within 60 days after the last item is furnished.

"If a man desires to close out his lumber business through ill health or any other similar cause, he can do so without experiencing any material loss, as a stock of lumber, if well cared for, increases rather than decreases in value. It is about the only business that I know of where stock improves in value by keeping. The groceryman in closing out must of necessity lose on the original value of his stock for shop wear.

"There are excellent opportunities for lumber dealers to open yards at different small towns that are springing up along the line of the roads. This is especially tho case on the Fargo & Southwestern road, which is now building. The country along the road is rapidly filling up.

"It is not advisable for a man to start in tho lumber business without a fair amount of capital. If he has $5,000 he can carry a good stock. As in every other business, the more capital a man can put into it the more economically and satisfactorily he can carry it on. In Fargo one lumber firm has a capital of $100,000. The combined capital of the six firms in Fargo is probably about $200,000.

"Sales are frequently made of lumber amounting to from $1,000 to $7,000 in value. Those are likely to occur in small as well as large places. The counties all through north Dakota are using a large quantity of heavy timber for the purpose of building bridges across the numerous river that water the country. Houses are mostly plastered, and, of course, there is a large demand for laths."

"How will prices rule during the coming season?"

"About the same as last year. There was a tendency in a downward direction—at least before the logging season begun, we thought that prices would be somewhat lower, as the cut promised to be very large. But the small-pox got into the camps and the work did not progress as was expected, and prices will probably hold their own. The fall trade last year was light and a larger stock of dry lumber than usual is on hand. It was hoped that there would be a decline in prices of about two dollars a thousand, but it cannot be expected now. There will be more dry lumber this year than there was a year ago. This will be a boon to consumers."—*Lumberman's Gazette.*

CEDAR POLES.

The present season has showed a much increased demand for cedar poles. Chicago is the largest point for their distribution in the country, and probably markets half the poles that are cut. From the nature of the business, the domand being altogether with a certain number of telegraph and telephone corporations, a few parties control all the contracts. Up to four years ago, poles were received almost entirely by cargo, but since that time the practice of shipping large numbers of poles by rail during the winter has come in vogue. One large handler sold 125,000 poles during 1882, and up to date has handled 90,000 poles since January 1, and estimates that he will add 125,000 poles to the amount by the end of the year. He has received 400 car-loads this month, and 1,000 car loads since January 1. There will likely be 500,000 poles used in the United States this year. There are always a certain amount of repairs necessary that call for poles, and new telegraph lines, or extensions of old ones, require a large number. But the heavy increase in demand is chiefly on account of the numerous extensions of telephone systems all over tho country. Tho poles coming to this market are from tho white cedar forests of Michigan, Wisconsin and Canada; the South uses considerable red cedar from Arkansas and Tennessee: chestnut poles prevail in the East, and sawed redwood on the Pacific slope. The buyers of poles are few, and there is considerable risk and hard work in getting them out, tho effect being to keep the business almost entirely in the hands of old concerns. The supply is always regulated in advance by the requiremont. When the demand is good as now, with prospects of future heavy consumptien, the contractors spur up their agents to cut and buy largely, or to retrench whon contracts are slow. Prices are influenced variously by the existing circumstances. Poles received by rail cost more than when received by vessel. Poles 25 feet long are quoted at from 85 cents to $1.25 on cars in Chicago. Cedar poles are sold by Chicago handlers to go to any remote points, in all directions of the compass, as, for instance, to Arizona, Salt Lake City, Syracuse, St. Louis and New Orleans.—*Northwestern Lumberman.*

QUINZE PIER AND BOOM COMPANY.

Mr. Tasse moved in the House of Commons that the House go into committee on the bill to incorporate the Quinze Pier, Boom and Improvement Company.

Mr. White (Renfrew) said this was really a proposal to give two gentlemen, Mr. Allan Grant and Mr. O. Taggart, the right to construct works on a portion of the River Ottawa, which was declared by an Act of this Parliament to be a navigable stream. The portion on which these works were to be constructed was above Lake Temiscamingue, through which the timber from a very large extent of territory was required to pass. Although the names of five corporators appeared in the bill, they were practically only two, as the other three were men of straw in the employment of Mr. Grant, and were simply inserted to make up the number required to apply for an Act. He (Mr. White), did not believe it to be in the public interest, that the control of so considerable a portion of a river like the Ottawa should be placed in the hands of private individuals. He was informed that licenses had been issued to the extent of 1,200 or 1,500 square miles above the point where these works were to be constructed. It was stated that the works, power to construct which was asked by this bill, extended over 200 miles from the head of Lake Temiscaningue, though the interests of these two gentlemen did not extend over more than twelve or fifteen miles, or at the utmost twenty miles. He was strongly of the opinion that these works ought to be constructed by the Government, and he suggested that these two gentlemen could not be in any way damnified by postponing this Act for a year, and if the Government, upon examination and due consideration, should come to the conclusion that they would not be justified in improving that portion of the river, he would offer no objection next session to a charter been given for the purpose to these or any other gentlemen. If, however, the House should decide that the bill should pass, he would move in committee an amendment giving power to the Government to acquire the works when they thought proper.

Mr. Tasse said the promoters of this bill had deserved well of tho lumbering interest, as they had been the pioneers of the trade in that portion of the Ottawa Valley. He had letters from eight or ten of the most important lumbermen interested in that locality approving of the bill. He read extracts from letters from Messrs. Egan, D. Moore, Hisson, Allan Gilmour, Conroy, Dr. Church, Alex. Fraser and Richard Nagle. In committee he would propose to meet the views of his hon. friend from North Renfrew, by an amendment which would limit the operations of the promoters to an extent of thirty or forty miles. He would have no objection to the Government constructing the works if they were prepared to go on with them, but he did not suppose that they were at present. At all events he was prepared to accept the amendment giving the Government power to assume the works.

Mr. Bryson said he thought this bill was not in the public interest. This portion of the river required improvement, but the promoters of this bill were only two men who were lumbering near the Quinze Rapids. He suggested that the Government should send an engineer to make a report on that portion of the river, and if they were not prepared to improve it next year he would support the bill.

Sir Hector Langevin said the promoter of the bill had agreed to limit the operation of the bill to a small portion of the river between Lake Temiscamingue and the Lake des Quinze, where the petitioners had their works and their timber. so that the hon. gentlemen's objection on that ground would be met. He was not sure that the Government would undertake these works. Those on the Upper and Lower Ottawa now were not Government works, and he did not see why a company should not be incorporated to improve this portion. He thought it showed great enterprise on their part to do this without asking aid from the Government, and a clause was to be inserted giving the Government power to purchase the works at their value. The logs of the limit holders above Lake des Quinze would pass through these works and pay the tolls which had to be approved by the Governor in Council and might be altered by him at any time. The formal approval by the Governor in Council was also required of the character of the works, and the company would not be likely to construct them in an inferior manner, as the destruction of the works would be a great loss to them.

Mr. Blake suggested that the difficulty might be avoided by providing for the opening of stock books, so that all the limit holders would have an opportunity to attend to their own interest.

After some remarks by Mr, Dawson, the bill was read the second time.

The House went into Committee of the whole, Mr. Kilvert in the chair.

On the motion of Sir Hector Langevin, a provision was inserted that, "after one month's notice in the *Canada Gazette*, a book shall be opened at the chief place of business of the company in which any person may subscribe for shares in the said capital stock, and, in case a larger number than 500 shares shall be subscribed for, then there shall be an allotment of shares among the subscribers, so that no subscriber shall be excluded."

On the motion of White (Caldwell) a clause was added providing that "the Governor in Council may assume the works, or any portion of the works, on payment of the value to be fixed in case of disagreement by the Official Arbitrators of the Dominion.

The bill, as amended, was reported, read the third time and passed.

DESTRUCTIVE FIRES.

Michigan, it would appear, is not the only state in which the reckless destruction of timber is carried on. It is well known that in this state, Minnesota, and in fact in all the northern states which are recognized as timber furnishing states, the pineries, as well as some of the other timber bearing territory, are annually more or less devasted by fires which are in many cases the direct result of carelessness on the part of land-lookers, hunters, pioneer farmers, and others. A match, with which a hunter may have lighted his pipe, carelessly dropped, or the dying embers of a fire left by the land-looker, and fanned again into a flame by a passing breeze, or the charred remains of a burning log heap of the farmer, once more ignited by the bed of coals left thoughlessly to smoulder, or even the burning wad from the gun of the sportsman, may be the means of the destruction of thousands, yea, millions of dollars worth of timber, or perhaps worse, hundreds of lives, as in the case of the destructive fires of Michigan in September, 1881. But it would seem that this reckless carelessness and seeming indifferenee to the safety of life and property is not confined to Michigan and the other western and northern States, which have heretofore obtained recognition as the great lumber producing territories, but is obtaining a foothold in the southern states, which if not nipped in the bud, by stringent legislation, will, when the scenes of activity and the conversation of pine timber of the forests into lumber shall have been more fully transferred thither from the north and west, as it inevitably must be, in the not very distant future, be the most disastrous and direful in its consequences, and it therefore behooves the law making powers of these states, while the lumber business is yet virtually in infancy, to demand a halt in the reckless methods which have obtained a foothold. In alluding to this carelessness in a late issue, the *Southern Lumberman* says that "this abominable and and wasteful custom holds sway in certain sections of our country, and as the perpetrators of the outrage do not heed kindly admonition, it would be well for the legislature to pass a stringent law with reference to it and attach thereto a very severe penalty. We have frequently received letters on the subject and in answer to them published articles relating thereto but to no purpose. Trifling white men and negroes or thoughtless boys are the perpetrators of these deeds. To destroy thousands of young trees is to them a secondary consideration to driving a harmless rabbit from a thicket. Others again fire the wild grass in order to hasten a new growth, never thinking that the timber destroyed or badly injured by the process is worth many times more than the pasturage and the animals which feed upon it." It will be observed that the practices which prevail there, are not at all dissimilar to those which prevail in this state, and if not checked in the incipient stages, may yet prove as disastrous as they did in Michigan in 1881.—*Lumberman's Gazette.*

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* writing on April 7th, says:—For the first time during the present year, I am happy to have to chronicle a decided improvement in the position of the Swedish sawn wood trade. Very considerable sales have been effected of the better brands of redwood from the ports south of Sundswall to the Continent, at prices about 10s. per standard less all round than first open-water figures 1882. The sales in question (and this is the most encouraging fea-

ture of the case) have been spread over a large number of small ports, instead of being confined to a few of the larger places. Beginning with Belgium, we find Antwerp the heaviest purchaser of goods of best quality, including planed boards. This port (which bids fair to eclipse all continental *entrepots* in the magnitude of its general trade) is, however, in an exceptional position, and forms the natural distributing point to which the great bulk of Belgian wood consumers look for the supply of their requirements. In the absence of any statistical information on the subject, and merely judging from observation, I am inclined to believe that no continental port has increased its wood trade so rapidly as Antwerp. Crossing to France, we find nearly the whole of the northern French ports have purchased fairly, with the exception of those supplying Paris, where the building trade appears to be entering on a stage approaching a crisis. Marseilles has bought freely, and the same is the case with Barcelona and the other Spanish ports on the Mediterranean.

The firms who usually confine the bulk of their business to Great Britain have apparently sold least, and it is to these importers they will have to turn for the further modification they so stubbornly insist on, as it is scarcely likely to be conceded by those who have sold so largely to the Continent. An advance of 5s. per standard on their March offers for red deals has been lately made by one or two London importers, but which were nevertheless declined as being still too low. A somewhat improved tone is also reported by exporters to be prevalent in the market for whitewood, although personally I have seen little of it, It may, however, with some degree of certainty be anticipated that the present improved tone will further develop as the conviction gets abroad that the opening of the ports will occur a month later than at one time expected.

Iron Columns *v.* Oak Pillars.

The following is from the *City Press*, London, England:—Perhaps when a few more tremendous blazes have destroyed thousands of pounds' worth of property and the buildings in which the goods have been stored, builders and architects will begin to ask themselves if slender iron columns and iron grinders are of any use in withstanding the ravages of fire. It is an undoubted fact, receiving confirmation daily, that iron is of little use when attacked by fire. It gets red hot and expands; cold water is thrown upon it; a sudden contraction takes place, and away goes the building. A sad example of this kind of destructive effect may now be seen in Rose Street, and Newgate street. Depend upon it good solid oak pillars and strong solid wooden floors are a better protection from fire than flimsy iron."

A Million's Worth of Timber Seized.

The Prince Arthur's Landing *Herald* of April 25 says that during the past winter the Section B company got out over a million dollars' worth of lumber in the disputed territory, for railway building purposes. They took out over 1,750,000 ties alone. But the company got no license from or paid the Ontario Government any money, and the latter have instructed their inspector of lumber at the landing, Wm. Margach, to seize all the ties and lumber in question. Mr. Margach took the train as far as Savanne, from which place he will take to the woods and seize everything that has been cut, posting up notices that anyone touching the materials will be arrested and dealt with as a person would be for stealing. His instructions are very emphatic, and he says that he intends carrying them out to the letter.—*Toronto World.*

Elm Logs.

Sir Leonard Tilley in answer to Mr. Smyth, in the House of Commons said that the Government had received petitions last session from residents of Kent, Ont., praying for an export duty on elm logs, and the Government took the matter into consideration, but did not see their way clear to grant the request. No petitions had been presented this session, and it was not the intention of the Government to ask Parliament this session to place an export duty on these logs.

SWEDISH STOCKS.

The drop on Swedish stocks since the first quotations were to hand may be generally estimated at between 5s. to 10s. on best goods, and 10s. to 15s. on the commoner qualities, due to the proportion of best being rather below than above the average quantity, and we do not anticipate that these will be further reduced, the likelihood being rather that an improvement will result when the general body of importers come into the market to supply themselves. A great deal will depend, of course, on the state of trade generally, irrespective of the particular branch this *Journal* represents, and that the almost unprecedented flatness so long prevailing is at length yielding to a more general tone of activity is noticeable everywhere; and if the present seasonable weather continues, this improvement in the spirit of trade will greatly assist the wood market, the supply of timber being dependent to a great extent on the general tone of prosperity prevading the country. If other trades are active the building trade can hardly be the reverse, and so with regard to the consumption of wood generally. When money is plentiful speculation will be brisk in all directions, and no lack of business in the wood trade need appear when confidence in trade is once assured.—*Timber Trades Journal.*

Sault Ste. Marie.

A scheme is incubating to convert the Sault Ste. Marie, between Lakes Superior and Huron, into an immense water-power, by constructing a flume from the head of the canal to a point below the village, thus securing a fall of 18 feet—enough to drive a multitude of mills. A bill has been introduced into the Michigan legislature to provide for the incorporation of a company to improve and control this water-power. It is proposed to build saw-mills, flour mills, and other manufactories at that point. Since the prospect is that the Northern Pacific will form a connection with the Canadian system of railroads at the Sault, why is not the scheme a good one? It might become an important manufacturing point of lumber, iron and flour, with shipping facilities by rail and water equal to the best.—*Northwestern Lumberman.*

What the World Heard in the Woods.

I have a corn—The oak.
I'm off my nut—The hickory.
These hands are clean—The palm.
I've got the sand—The beech.
You can't get into my trunk—The hemlock.
I'm never odd—The pear.
I sometimes go back on my pals—The peach.
It's pitch and toss—The pine.
By gum—The spruce.
I never unbosom myself—The chestnut.
Who said I was proud?—The plane.
You'll hear me down in Dixie—The cedar.
I've got the sugar—The maple.
They can't skin me—The fir.
There is no oleomargarine about me—The butternut.
I cannot sing the old songs—The basswood.
I will have to go to law—The sumach.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle,

THE Muskoka *Herald* says:—Several trains loaded with timber have passed through Pembroke on their way east. The timber belongs to Mr. N. McDougall, and was taken out on Sturgeon River, Nipissing. Messrs. Barnett and Mackie's Nipissing timber will not begin passing through Pembroke till May, as at present it lies on the ice on the opposite side of the lake from the railway track. When the ice disappears the timber will be floated across the lake to a siding on the Canadian Pacific Railway, and there loaded on the cars.

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:
JAMES EPPS & Co., Homœopathic Chemists,
18t1y London, England.

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address
ASH & ROBBINS,
20l24 360 Fulton Street, Brooklyn, N. Y.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. MAY 15, 1883.

FLETCHER BROTHERS, of Minneapolis, Minn., owners of a large tract of cedar land on Squaw bay, Duluth district, will operate several portable mills in working up the cedar on the tract this season.

THE *Northwestern Lumberman* says that Munroe, Boyce & Co., of Grand Haven, Mich., are reported to have been offered $110,000 for a tract of pine land in Chippewa county, Mich., for which they paid $40,000 a few months ago.

AT an adjourned meeting of the shareholders of the Arthabaska Lumber Co., held in Quebec on the 24th April, it was resolved that the Company be wound up voluntarily and dissolved, Mr. James R. White being appointed liquidator.

IN the House of Commons Sir Leonard Tilley said the Government did not foel itself justified in asking Parliament to impose an export duty on hemlock bark, neither did it propose to increase the export duty on spruce saw logs.

THE demand for oak timber in the West appears to be greater than the supply. Mr. Thomas Ouillette, of Anderdon, has shipped from his mill at Colchestor, three and a half million of oak car stuff to the London Car Works at London.

THE Winnipeg *Times* says :—During tho past winter two million ties were cut for the Canadian Pacific. The company will not, it is expectcd use the whole of this amount this summer, although a considerable quantity is to be utilized in repairing certain portions of the line.

Mr. J. W. Nesbitt, formerly book-keeper in Peterborough for the firm of McDougall & Ludgate, subsequeutly having charge of the limits and mills for the Bank of Toronto, and who has more recently been managing the lumber businoss of Mr. R. C. Smith at Fenelon Falls, has been appointed assistant manager of the American Lumber Company of Northern Michigan. The company is to be congratulated on having secured the services of such a competent, trustworthy and zealous officer.

THE Montreal *Witness* thinks if the railways generally become seized with a spirit of forestry renaiscence, as the Toronto, Grey & Bruce seems to have been, it will be a fine thing for the country. That corporation is having ten thousand larch trees from Scotland planted along its line.

THE oldest tree on earth, so far as any one knows, is the "Bo" tree in the sacred city of Amarapoora,, Burmah. It was planted in 288 B. C., and is accordingly 2,171 years old. Its great age is proved by historic documents, according to Sir James Emmerson Tennent, who says :—"To it kings have even dedicated their dominions, in testimony of the belief that it is a branch of the identical fig tree under which Buddha reclined at Urumelya when he underwent his apotheosis" Its leaves are carried away as streamers by pilgrims, but it is too sacred to touch with a knife, and therefore they are only gathered when they fall.

THE *Sun* of Brandon, Manitoba, says that Mr. Wright, a farmer living in township 4, range 20, is now in the city, and reports that on his journey through township six he saw a number of soft maples raised from seed sown last year that are now eighteen inches high. They are budding beatifully after passing through the rigors of the Northwest winter, and give every promise of a healthy and rapid growth. This should settlo the question of forest culture on our Northwest prairies. Mr. Wright is endeavoring to procure some seed with which to experiment on his own farm. It is an example that all our farmers might profitably follow.

VICTORIA, Australia, now claims the glory of holding tho biggest of all the living "big trees" in the world, so far as height is concerned. In the Dandedong district, at Fernshaw, has recently been discovered a specimen of *Eucalyptus amygdalina*, or almond-leaf gum, which reaches the enormous height of three hundred and thirty feet to the top, having a girth of sixty feet at some distance above the ground. Some idea of what a height of four hundred and thirty feet represents may be gaiued from the fact that this gum-tree, if growing by the sido of the House of Parliament at Westminster, would overtop the clock-tower by exactly one hundred feet.

THE *Trent Valley Advocate* says that Messrs. Gilmour & Co's. large mill is now in full operation. The machinery has beeu greatly improved during tho winter, and the cutting capacity thereby increased. The cedar mill is running every day, aud a large boiler and engine house is being built for the shingle mill. In this building will be twelve tubular boilers and one of the larger engines out of the old mill. Thc railroad leading to the piling ground has been well ballastod, and a large new locomotive been placed on the rails which will be nsed for drawing the lumber trains from and to the piling ground, while the two small ones which were used last season will uow be used on and around the docks for shipping purposes.

THE London *Timber Trades Journal* says :—Up to the preseut we can hear of no large first hand transactions in Quebec, and we believe the bulk of the stocks are still unsold. It is reported that the merchauts who usually visit this country in the beginning of the year have been disappointed by the result of their trip, values of pine deals having declined since the first sales were made, and nothing like the volume of trado has been done as was expected. In timber the usual amount, we hear, has been sold, but the prices realized have not beeu satisfactory. In the London market stocks are held in first hands at firm prices, but we understand very little is yet sold. That business, however, has not been idle in the f. o, b. trade we can well believe, as a cousiderable amount of tonnage has been secured at 65s. for the Thames. In Glasgow things are said to be anything but promising for the pine trade, and the competition with Lower Port spruce and Baltic white wood is depreciating the commoner qualities imported from Quebec, while sales of all descriptious are reported as being dull.

A KINGTON despatch says that J. P. Lett & Bro., of Bedford Mills, cut upwards of 2,000,000 feet of timber on their limits in Bedford township during the winter. They aro now running mills night and day, cutting every 12 hours an average of 20,000 feet of lumber. The season's cut has been sold in advance.

A NUMBER of timber trespass cases have been brought in the Territory of Oregon, the encroachments being upon the land grant of the Northern Pacific Railway Company. The government agents reported the trespass with a view to prosecution, because the land, though in the title of the railroad, was unearned. Secretary Teller decides that the government can only prosecute with reference to even sections, and that the railroad clearly has authority to prosecute trespassers on odd sections, though its grant is unearned.

ARBOR DAY.

THE success that has just attended even the first observance of "Arbor Day," as set apart by the Government of the Province of Quebec, is very satisfactory, and promises even better results in the future when the people become more familiarized with the subject. It is rather the fashion in some of the other Provinces either to sneer at or patronize Quebec as an unprogressive and little energetic community, but in this respect, as in some others, it has set an example that their critics may well follow.

The establishmeut of "Arbor Day," the setting apart of a public holiday for the planting of trees, is not a new idea, but is borrowed from our neighbors, where in several of the States the treeless prairie has already been converted into fairly wooded country. The usefulness of this process is plainly evident. So far in Canada there seems to have been a ceaseless war waged against the forest. Settlers and lumbermen have agreed, however much they might disagree on other points, to strip the land of its forest wealth, without a thought of maintaining a future supply. The circumstances of the case, the dense forests of the earlier settled portions of Canada from which the intending agriculturalist had to hew out his farm, and tho timber regulations which have almost forced upon the lumbermen the policy of makcting their pine as rapidly as possiblc, have alike tended to foster the idea that the mere cutting down of a tree was a meritorious act which could not be repeated too often. As for the future, that might take care of itself, and our forests were deemed practically inexhaustible. The result is that our piue lands have been trenched upon to an enormous extent, that the settled country has been stripped of sholtering trees till winter killed wheat, or cattle sweltering in the summer sun testify to the improvidence of those who frequently burned timber which would now be more valuable than the cleared land.

It would be well for Ontario and the other Provinces to follow the lead of Quebec in this matter. The direct effect of "Arbor Day" would be beneficial to a very great extent, and besides it would have the further indirect benefit of inculcating throughout the community the lesson which is already being slowly learned, that if trees are cut down others must be planted, and above all that a more sensible and economical policy in regard to our public forests, a large portion of the capital of the people, should be adopted and cuforced by the Governmeut.

OAK vs. PITCH PINE.

OUR attention has been called to a matter which should receive the serious consideration of those concerned. We are informed that till quite receutly in Canada our white oak was invariable used for car sills ; now, owing to the somewhat advanced price of oak, many car builders are substituting southern pitch pine for this purpose. Now, while this class of pine is excellent material for many purposes, there can be no question as to its total unfituess, in comparison with white oak, for car sills. Pitch pine, something like our own red piue, is short in grain and brittle, lacking altogether that toughness of fibre so preeminently characteristic of white oak, aud which marks the latter timber as so peculiarly fitted for any purpose where it is required to stand a great strain or carry heavy weight. The sill is the most important part of the body of a car, and unless it will stand heavy shunting, and bear great and constant pressure, without risk of fracture, it is unsafe, and a source of danger to traffic and the travelling public. This is where we think pitch pine will be found wanting, and so, when too late perhaps, the railway companies and car builders will find out.

There can be no doubt as the superiority of white oak over pitch pine or any other wood for this purpose ; it is the toughest, its power of resistance to pressure is the greatest, it is not liable to crack or splinter by a sudden jar, thus reducing the danger in cases of collision, and, it is the product of our own country, while pitch pine has to be imported from the Southern States.

THE OUTLOOK.

News from the drives is not very encouraging. The Rifle and Cedar and tributaries are hung up, and the same report reaches us from scores of small tributary streams to those of more importance. Never in the history of the Tittabawassee Boom Company has there been so few logs within the boom limits on a corresponding date as at the present time, and the water in nearly all the streams tributary to the father of logging streams is at a very low stage. Unless there is a superabundance of rain within a very short time, it is inevitable that even with the short season before us, many of our mills will be short of stock. It looks at present that before the shipping season shall near the end logs will be logs and lumber will be lumber on the Saginaw river, and those who have been hoping and expecting a decline in the price of our principal product, will find themselves woefully mistaken. This condition of things is not confined to the Saginaw river alone, but the streams in the Lake Superior district are similarly situated, the snow having disappeared gradually and the earth adjacent thereto in an absolutely dry and parched condition ready to absorb an ordinary spring rain ; and consequently nothing short of a fair proportioned deluge will be successful in bringing the log crop to the mills. Indications at present are unmistakably in favor of high-priced lumber and opposed to any reduction in price. If the present state of affairs in regard to logs continues to exist, even the coarser grades of lumber must soon present a firmer attitude, and the owners of this class of lumber may undoubtedly rest easy, from present indications.—*Lumberman's Gazette.*

THE SWEDISH TRADE.

A Swedish correspondent of the *Timber Trades Journal* under date of 19th April, writes that "the driving out of the logs from the district of the Ljunga, Indals, Angerman, and Husum rivers, has this season been so exceediugly bad that the supply from these districts will be quite 30 per cent. less than during ordinary years. There is also a fear of very bad floating this spring, if the snow should melt away before lakes and rivers are free from ice. Still the weather here is very cold, particularly in the night, and all around about there are masses of ice and a considerable quantity of snow. The Lake Malare and the harbor out to seaward from Stockholm are still strong enough to drive on with horses and carriages." This we give for what it is worth ; at any rate the shortage in the log crop auticipated by the above correspondent, even if his views prove correct, will not affect the first open-water production, the leading brands of which we have already stated are now pretty nearly sold out. The rivers the writer mentious are in the centre of the chief timber-producing districts and any iuterruptiou to the floatiug in those parts would probably be more seriously felt than in any other portion of Sweden. The Angerman supplies Hernosand and the district bearing that name, while the Sundswall district is mainly depeudeut on the floatage of the Ljunga and Iudals streams for its wood production.

ST. JOHN LUMBER EXPORT

Twenty vessels left St. John in April laden with timber and lumber. The quantity they took was 749 tons of piue aud birch and 15,804,000 feet of deals aud battens. For the four

months ending with April the clearances of lumber from that harbor amounted to the following aggregate :—

Deals, battens and deals ends..25,455,717 sq. ft.
Scantling and boards..... 204,569 "
Palings..... 50,000 pcs.

Besides these there were 279 tons of pine timber and 1,579 tons of birch timber shipped from that city. Messrs. Mackay, Schofield, and McLachlan & Wilson sent all the timber, the whole of which went to Liverpool ; Alex. Gibson sent 18,800,000 of the deals, Stewarts & Guy Berans nearly all the rest. The destination of 637,414 feet of deals was Africa ; and 1,341,416 feet went to the Continent of Europe. Liverpool takes the largest share, with 5,764,000 feet, London next with 3,068,000 feet ; Dublin takes 3,009,000 ; Glasgow 2,349,000, Belfast, Penarth and Barrow next.—*Monetary Times.*

THREE IN ONE.

A correspondent writes to the *Northwestern Lumberman* from Tigerton, Wis., as follows :—With the expiration of certain patents, relating to the process of cementing two or more pieces of wood veneer, the three-ply system of manufacture assumes a new importance. Ignoring the question of cost, there are several advantages, which of themselves, must commend the process to furniture manufacturers, and, in fact, to all who make articles from wood, wherein lightness and strength are especially needed.

All have admired the neat and strong veneer chair bottoms and car-seats, but comparatively few have thought that this strength is obtained by the gluing together of three thin pieces of veneer, with the grain of the central piece running at right angles with that of the other two. Just here is involved the principle upon this scale-board may be applied with advantage in the manufacture of articles almost innumerable. To the furniture manufacturer a rare field is here opened, whereby he may execute new and fanciful designs, lighter and stronger than is possible to obtain by the use of sawed lumber. To the carriage and waggon manufacturer, various uses will readily suggest themselves, as also in the making of toys and similar small articles. Passenger coaches are already being lightened and strengthened by the aid of the three-ply veneer. The scale-board may also be profitably used in the inside construction of thrashing machines, fanning-mills, etc., and, finally, the house-builder can apply it for inside finishing and panels.

The process of gluing together two or more ply scale-board, or panel of plain surface, by the aid of an ordinary screw-press, is simple enough, but to form the necessary shapes for the different uses, as herein indicated, will, of course, require special machinery, which, as in other things, will doubtless be furnished as the purposes to be gained are fairly understood.

LUMBER CARRYING TRADE.

An Ottawa despatch says :—The American boat captains and owners still hold out for advanced rates for carrying lumber. They have formed an association and passed the following resolutions :—

1. Resolved, That all boats load in turn, as placed on list of arrival.

2. Resolved, That all captains of boats being offered $4.00 to New York and $3.75 to Albany shall refer such offer to the first boat on the list, or take said order and refer the same to said boat, as above stated.

3. Resolved, That should any captain of a boat having signed this list leave our ranks in any manner, or load contrary to our by-laws, we are empowered to publish his name in all the leading papers on our route and to stigmatise him as a man of no honour, and one in whom no dependence can be placed.

EXPENSIVE FOOD.

About the most expensive kind of food for porkers that we have heard of in many a day is that furnished by some of the pine land owners of South Carolina, who turn their pigs into the forest to shift for themselves, as it were, thinking it a cheap method of raising pork. It appears that the fondness of hogs for the juicy roots of young pines leads them to seek them assiduously, so that where hogs are allowed to roam in that region one can hardly find a young long-leaved pine in a thousand acres of pine forest. There being no young trees to take the place of the old ones used up by the lumbermen and the porcine marauders this species of pine is disappearing. It would be far cheaper for these men to furnish corn feed, and confine their hogs in pens, than thus to rob posterity of the rich legacy which properly belong to them.—*—Lumberman's Gazette.*

New York Notes.

The *Northwestern Lumberman* says :—The general appearance of the lumber market is not as satisfactory as hope pointed out a short time ago. There is an inclination in many directions to be bearish. A lower rate of values would be desirable to consumers, and buyers of stocks for consumption do not take hold with energy. A careful and conservative method is followed among dealers. There is naturally a little hesitancy at this season of the year, a waiting to see what particular damage is likely to be done by the periodical spring strikers. During the past week there was a dullness apparent in general trade. Iron has taken a new line of value, and that has a powerful influence on all other mercantile interests.

Durable Timber.

The trusses of the old part of the roof of the Basilica of St. Paul, at Rome, were framed in 816, and were sound and good in 1814, one thousand years. These trusses are of fir. The timber work of the external domes of the Church of St. Mark, at Venice, is more than 840 years old, and is still in a good state. Sound logs are dug out of bogs where they have lain for an indefinite period. But the best seasoned timber will not withstand the effects of exposure to the weather more than twenty-five years, unless the surface is protected by paint, or some other coating to keep out the damp, or the wood is treated by some preservative process.

The Census.

The third volume of the census reports gives the following statistics of products of the forests.—Cubic feet of square pine (white) 40,729,047, (red) 2,815,755 ; cubic feet of square oak, 5,670,894 ; cubic feet of tamarac, 4,652,575 ; cubic feet of birch and maple, 4,414,795 ; cubic feet of elm, 3,191,968 ; cubic feet of walnut (black) 59,032, (soft) 754,219 ; cubic feet of hickory, 387,619 ; cubic feet of all other timber, 48,956,958 ; pine logs, 22,324,407 ; other logs, 26,025,584 ; masts, spars, etc., 192,241 ; thousands of staves, 41,881 ; cords of lathwood, 98,311 ; cords of tanbard, 400,418 ; cords of firewood, 10,993,234.

THE Pennsylvania log markets have been active and very satisfactory to the sellers. Rafts have been rapidly taken at Lock Haven and other prominent points, under the stimulus of light stocks and good quality. The highest price given is 26 cents.

THE Shell Lake Lumber Company, of Shell Lake, Wis., has got in about 19,000,000 feet of logs, and is now building five miles of narrow guage road, in addition to the old line of four and a half miles. The streams in that vicinity are at a good driving stage.

THE *Timber Trades Journal* says :—Fifty-one arrivals are announced as timber laden vessels in our London list this week, of which 18—only a little over a third of the whole—are steamers, so that sailing ships are again predominating in the timber trade. Of the total number, Norway sent forward 23 vessels, but only four of these added to our stock of boards, and six were laden chiefly with fir staves, with which this market may now be considered well supplied, the rest were variously laden with deals, battens, and firewood, and one cargo of telegraph poles from Porsgrund. There are the usual liners from New York and from Gothenburg with joinery and other oddments. Three cargoes of mahogany and a good supply of other furniture woods have also come forward in this fleet ; so that scarcely any branch of the wood trade need now be short of the goods it may require.

FOR SALE

A Railroad Tie Saw & Carriage

(COMPLETE).

A HORIZONTAL ENGINE, 11x14 in., Fly Wheel 7 ft. Diameter, Band Wheel 4 ft Diameter, 12 in. Face, Heavy Bed and equal to new. ALSO,

A HORIZONTAL TUBULAR BOILER, 48 in. Diameter, 9 ft. long, with 96 2-in. Tubes, Fire Front, Back Door and Frame, Grate Bars and 40 ft. of Smoke Stack 22 in. Diameter.

CENTRAL IRON WORKS,

4L7 PETERBOROUGH, ONT.

LACHINE CANAL.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the under-signed, and endorsed "Tender for the Formation of Basins near St. Gabriel Locks," will be received at this office until the arrival of the Eastern and Western mails on WEDNESDAY, THE 6TH DAY OF JUNE next, for the formation of TWO SLIPS or BASINS, on the north side of the Lachine Canal, at Montreal.

A plan and specification of the work to be done can be seen at this office, and at the Lachine Canal Office, Montreal, on the after TUESDAY, the 22nd day of MAY next, at either of which places printed forms of tender can be obtained.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms.

An accepted Bank cheque for sum of $2,000, must accompany each tender, which sum shall be forfeited, if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer submitted. The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,

A. P. BRADLEY.
Secretary.

Dept. of Railways and Canals, Ottawa, 21st April 1883. 6d100-2L12

AUCTION.

Phosphate Lands.

Conformably to the 158th Section of the Quebec General Mining Act of 1880 (43-44, Vic. Ch. 12.)

Notice is hereby given that upwards of 6,000 acres of public lands situated in the Phosphate Region, in the county of Ottawa, Province of Quebec, and comprised in the townships of TEMPLETON, WAKEFIELD, PORTLAND (EAST and WEST), and BOWMAN, will be offered for sale by Public Auction, at the City Hall, in the city of Hull, Province of Quebec, on THURSDAY, the 31st day of MAY next.

Sale to commence at eleven o'clock a. m. sharp, upset price five dollars per acre.

Conditions of Sale—the purchase money to be paid in full at the time of adjudication, otherwise the land will be immediately re-offered for sale.

The purchaser to pay for any real improvements existing on the lot or lots belonging to any other party.

These sales will also be subject to all the previsos contained in the laws and regulations concerning mines at present in force in this province.

LISTS containing numbers of lots to be sold may be had on application to the Department of Crown Lands, Quebec, or to the Crown Land Agents at Montreal, Hull, and Thurso, P. Q.

Department of Crown Lands, Quebec, April 14, 1883.

W. W. LYNCH,
Commissioner of Crown Lands.

N. B.—According to law, the Department will not be responsible for the publication of the above notice by any journal not specially authorized to that effect.

Quebec, April 14, 1883. 1L10

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

WATER POWER

TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of entering into partnership with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect a building of any size suitable for factories.

R. & G. STRICKLAND

1d86 LAKEFIELD, ONT. w1619

TENDERS FOR TIMBER LIMITS IN THE N. W. TERRITORIES.

SEALED TENDERS addressed to the undersigned, and marked "Tenders for Timber Berths" will be received at this office until noon, on MONDAY, the 2nd day of JULY next, for Timber Berths in the North-West Territories, situated on the Moose Mountain, in the District of Assiniboia, and on the Bow River and its tributaries, above Fort Calgary, in the the District of Alberta.

Sketches showing the position, approximately, of these berths, together with the conditions on which they will be leased, may be obtained at this Department, or at the Crown Timber Office, Winnipeg.

LINDSAY RUSSELL,
Deputy of the Minister of the Interior.

Department of the Interior, Ottawa, 18th April, 1883. 1L10

SAW MILLS

AND

TIMBER LIMITS

WITH

Logs, Lumber, Store Goods, &c

FOR SALE

In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

☞Canada Pacific Railway now running through part of the property.

For full particulars address :—

WILLIAMS & MURRAY,

L7tf GODERICH, ONT.

VALUABLE

Timber Limits

And MILLS

FOR SALE,

CONSISTING OF :

About 300 miles of limits in the Counties of Joliette and Montcalm, in the Province of Quebec, well wooded with spruce, pine, cedar, and traversed by the La Quarreau, Dufresne, and other rivers.

About 25 acres of land (freehold) with a splendid water power and saw mill, store, dwelling house and outbuildings, on the La Quarreau River, at Montcalm, about 40 miles from Montreal

About 100 acres of land (freehold) with a splendid Steam Saw Mill, capable of cutting 100,0 0 logs per annum, a large house for manager, 14 dwellings for employees, large machine shop, planing mill, bakery, store, fire engines and house, wharves, a steam tug, 3 barges, &c., &c., at Charlemagne at the mouth of the L'Assomption River, about 17 miles from Montreal.

Also, booms and dams on La Quarreau, Dufresen, L'Assomption, and other rivers.

Three vessels drawing 6 to 8 feet of water can load at the wharves at once, and ships, drawing 25 feet, can anchor with ¾ of a mile from the wharves, and load from barges.

The whole is complete and in running order for carrying on a large and profitable lumber business, and will be sold at a low price and on favorable terms.

For particulars apply to THE EXCHANGE BANK, Montreal, or to

JOHN M. M. DUFF,
Public Accountant.

5L8 118 St. James Street, Montreal.

THE MANCHESTER SHIP CANAL AND THE TIMBER TRADE.

The question of the proposed Manchester Ship Canal is now agitating the minds of business men connected with the wood trade. They do not look upon the change this great work will involve as a matter to be fully realized; but it has so far passed beyond the range of theory, that, with a slight discount, it may be accepted as a fact, and as an undertaking that in a few years will be successfully carried out.

Considering the interests of a vested character involved or interfered with by this great project, it is natural to find a strong array of opposition brought to bear against it in Parliament; but we are of the opinion, looking upon the vast population in and around Manchester, that their influlnce will carry a weight on behalf of the project against which no class of interest can maintain a permanont oppositiou. For ourselves, so far as the wood trade is concerned, we do not wish to take party sides, our position is that of lookers-on, in which we cannot fail to be impressed with the opinion that, as an engineering work in unison with the current of feeling permeating the breasts of nine-tenth of the business mon of this day, it will be carried out in the immediatc future, and that it will prove an initial step in the introduction of ship canals into this country.

As we are not alone in this opinion, it may not be amiss to discuss the bearings of this great project on the wood trade, and the changes that will probably come over the spirit of the scono in few years.

Timber is a bulky snbstance, locally produced in small degree in the district claiming Manchester as its centre; but, nevertheless, a snbstance largely and extensively usod. It is one consequently obtained from sources outside this radius, one floated to neighboring scaports on the east and west coasts. These ports may be taken as Gloucester, Liverpool, Fleetwood, and Barrow-in-Furness, on the one hand, and Hull, Grimsby, and the northorn coal ports, on tho other. From these points it passes inland, and the various lines of supply spread like a network over the Manchester district. Theso ports are active feedors of the district, and their annual increase is directly traceable to tho growth of tho inland seats of trade.

So long as the Manchester district is dependent upon the coast towns, so long will these towns increase and multiply; their prosperity lies in their position on the edge of the water, where great ships laden with timber, etc., may be safely floated. The office of these towns is to act as agents for receiving and forwarding goods inland. So long as the deep waters are kept in the present bounds they will flourish, but upon the sea flood being conducted inland by natural or artificial means they must of necessity decline, as facilities would be offered for carrying goods past their gates and harbors and dispensing with them as outlying agents. The inland districts so changed would have their supplies brought direct to their doors, and the produce taken direct from their hands. The loss to the one, and the gain to the other, arising from such a change, would be unparalleled in the history of British commerce.

So far as Manchester is concerned, such a change is proposed to be brought abont by artificial means; an arm of the sea is to penetrate the low flat lands forming tho bed of the river Mersey, and sea-going ships are to float up to this great and busy city. The vast population of this centre is to be enfranchised from the outlying coast towns, and the receiving and forwarding will be saved, added to which there will be a saving in land carriage, which is the dearest form of carriage in the world.

That such a change will be a benefit to the Manchester community there can be no doubt. These people are competing for the textile fabric trade of the world; in many countries they are opposed by heavy, and even prohibitory, tariffs; and hence, in their struggle for existence, they are entitled at home to every relief or facility that can be granted them. From their inland position they have a prohibitory home tariff on their export business, a tariff that extends to their import business in having their goods passed through outlying ports and carried overland. That the abolition of this home tariff, even in part, would be other than a benefit there cannot be a doubt; this being admitted there only remains the question of the right, of the outlying ports, and the connecting railways, to continue to impose this home tariff upon the Manchester community. This right needs to be well founded to withstand the pressure which will naturally be brought to bear against it by some thousands, and even millions of people struggling to become free from what they consider trammels of trade.

The consequence of Manchester becoming a seaport will be to work an important change in the wood trade. The great city will undoubtedly unload the bulk of its wood on its own quays, and every cargo of wood so unloaded will be one diverted from the old course of passing through the neighboring ports. The growth of the timber trade in this inland town will run on all fours with the decay at other outlying ports, those doing the most with Manchester being the first to suffer. To Liverpool the change will be great, for it is the natural port of Manchester; in other ports it will be felt in proportion to the volume of trade. The landing of timber on the quays of Manchester will have this additional effect, it will be so much further inland, that it can be traded in first hand, and Manchester will thus become a rival in districts now largely fed by Liverpool. The Manchester merchants will be so splendidly situated in the centre of a great consuming district, that they will in addition be able to compete for a portion of the trade enjoyed by other ports. So far as the west coast is concerned, this change will fall heavily on Liverpool and Barrow-in-Furness, but it will not affect Hull, Grimsby, and the northern coal ports, in the same ratio. The trade of the country is pretty clearly defined, certain ground belonging to the west, and certain to the east coast; an imaginary line may drawn down the centre of the country. To the west of this line the district is supplied with Canadian spruce as a cheap building wood, and to the east with Baltic whitewood. We can illustrate it thus—Manchester and Rochdale are towns receiving west coast wood, and Sheffield, Huddersfield, and Halifax, towns receiving east coast wood. In certain states of markets this arrangement is broken; but, as a rule, it obtains. The loss to the east coast ports by the ship canal will be this, that the line of separation will be driven more to the east, certain towns, now claimed as east coast towns, will have to be surrendered to Manchester, and the east coast ports will have to contract their trade. This change will not be so serious as may be imagined, for there is the protecting clause that the two coasts deal in distinct kinds of wood. The west coast deals in American goods, whilst the east coast deals in Baltic goods. The spruce of Canada and the whitewood of the Baltic will be affected, the former claiming the benefit of the change, from the fact that these are the rival timbering woods in ordinary use. It may be noted that the Baltic redwood, so largely traded in on the east coast has no opponent in American woods, and it is only represented in Liverpool, when taken round to the west coast from the Baltic at great cost. It thus follows that the moving of the line of supply in spruce and whitewood to the prejudice of the east coast, will have but slight influence on redwood. The Manchester district consumes a certain amount of redwood; but we fail to see how the ship canal, an undertaking associated with the west coast, will affect this consumption, or cause it to be obtained other than from the east coast, which is geographically its natural channel.

We have noted it as our opinion that the wood trade of Liverpool will be affected by this great work; but there are certain branches of the business that will be but slightly touched. Take the instance of American hardwoods, such as oak, ash, elm, mahogany, birch, walnut, lancewood, &c. These goods are used all over England, and Liverpool is the great market of the country for them, being the nearest trading point from the American continent. The canal would exercise no influence in moving this branch of trade from Liverpool, for on goods passing north and south it would offer no benefit, and on those passing east, seeing that their cost is high compared with their bulk, and that the cost of carriage compared with their value is a small factor, it would affect them but little. The great change would be wrought on the cheap, soft, bulky goods upon which the cost of carriage is heavy compared with their value. Liverpool would have a small advantage in the import cost; this, in connection with the north, the south, and the home trade of Liverpool, would exercise a preserving influence; but it would have little influence in the Manchester district. Looking at the wealth and importance of Liverpool, we must credit that town with an earnest effort to retain its trade in face of the rival ship canal, and we must not presume on the high rates of land carriage being maintained when opposition like this is in the field. We may assume the rate will then be a low one, somewhat in unison with the East Coast Railways. In face of such a rate, Liverpool would not lose so much of its softwood trade might be assumed, and even Manchester itself, which would have to pay canal dues and extra freight on its own imports, might, and no doubt would, still remain a buyer from Liverpool. The markets to suffer would be the west coast spruce and east coast Baltic whitewood. The consumption of spruce would increase, and that of Baltic whitewood decline. The great depot for spruce would be Manchester, which, from its central position would command a trade in this common timbering wood, which would materially increase its consumption to the prejudice of Baltic whitewood.

Beyond this we are of opinion that the hardwood markets on the west coast, and the Baltic redwood markets on the east coast, would be affected, but in such a slight degree as not to disturb the present balance of trade. There are those that would argue that the hardwood trade of Liverpool would be affected the same as the softwood; this we fail to see, for the change of market would have to be met by the discontinuance of the coasting trade—a branch of trade that Manchester can never conduct, and one that will always exercise a binding tendency on Liverpool as a market. It is fair to assume that occasional cargoes of mahogany and other hardwoods will find their way to Manchester; this could only be for local consumption, not for sale and general distribution.

Upon close consideration we find that the disturbance of the wood trade arising out of the construction of the great canal will not be so great as at first sight would appear. The tendency of the trade to migrate to Manchester would be largely met by a reduction of railway rates between Liverpool and this great centre, and it must not be forgotten that there is a wide margin for such reduction, the existing rate being extortionate.—*Timber Trades Journal.*

TIMBER IN PENNSYLVANIA.

It has become generally understood that the lumber interests of Pennsylvania are things of the past, and that state has often been referred to as illustrative of what Michigan was coming to in the very near future. But Pennsylvania still has vast lumber interests and new mills in Pennsylvania are being planted to-day which would do no discredit to the Saginaw valley. The forests are far from being denuded, and not only mills but factories are being planted for the purpose of utilizing the valuable hard woods with which the state is abundantly supplied. The lumber interest of northwestern Pennsylvania is enormous even at this present time, and the *Builder and Wood Worker* of New York city, says that the division of Clarion and Jefferson counties, which found a market over the low grade division of the Allegheny Valley railroad and Red Bank creek, during 1882 shipped 400,000,000, requiring 36,000 cars and a number of boats and rafts. The district of the same counties shipping by the Pittsburg & Bradford railway and the Clarion river have shipped 23,000,000 feet, using 3,500 cars and a large number of rafts and boats, though the full run by water was not made, owing to the drought. There are several million feet locked in the ice, and owners have proposed blasting the ice with giant powder to prevent loss, but they are threatened with prosecution for killing the fish if they resort to such means.

During the year 1882 Forest and Elk counties shipped 350,000,000 feet, using 30,000 cars. The product for 1883 promises to be considerably larger, as saw mills are multiplying rapidly. A mill has recently been built near Elk City with a capacity of 160,000 feet of boards daily. It is now running at an average of 100,000 feet daily. Another of the same calibre is now being built. These figures represent mainly pine timber, and the supply of pine is becoming rapidly exhausted. Hemlock and hardwood still remain in unbroken forests, but a few years will exhaust the pine. Over 20,000 acres of woodland were shorn of pine timber in the counties of Clarion, Jefferson, Forest and Elk, during the past two years, and last year the product was a fourth greater than the two preceding years.

The growth of hard woods in Sullivan county is enormous, and new and extensive furniture manufacturing establishments are being erected at various points along the line of the railroads traversing the woodlands, to produce furniture and other articles of utility and ornament that have a ready and profitable sale. Several large factories for the manufacture of painted wooden furniture have already been built and are now in full operation, their daily production being heavy and valuable.—*Lumberman's Gazette.*

FORESTRY IN CANADA.

The Government of the Province of Ontario, comprehending that, although 120,000,000 acres of primeval forest still exist within its territory, the replacing of its timber supply for future needs will depend upon the wise provisions made now, has had under consideration a bill providing for the payment of a bounty out of the public treasury for the planting of trees along farm boundary lines and by the sides of roads. The bounty proposed is not very large, the maximum sum being twenty-five cents for each tree, but it is quite enough to make it worth while for farmers to preserve and transplant the young saplings which they find in the way of their agricultural operations, and a moderate annual expenditure would in the course of years produce results of immense importance. A little calculation will show that if the highest bounty were paid in all cases, a subsidy of $50,000 per annum would at the end of three years represent 600,000 young trees; or, supposing one out of every six to die, half a million of growing saplings, which, if planted only along the roads, thirty feet apart, would line them on both sides for a distance of 1,420 miles. Continued for fifty years, the same subsidy would have led to the planting of 10,000,000 trees, worth on an average $5 apiece, all belonging to the persons who paid for setting them out, but bringing in, nevertheless, to the public treasury in the form of taxes, supposing these to be reckoned at the moderate rate of 1 per cent., $500,000 a year, or ten times the amount of the outlay. This is, of course, a rather summary way of calculating profits, but there is certainly reason for believing that in Ontario, and still more in this country, a movement of the kind suggested would be very judicious.—*American Architect.*

Requirements for Fences.

The *Lumberman's Gazette* says:—The fact that we have in the United States six million miles of fences, which have cost nearly $1,900,000,000, and have to be renewed every fifteen years, makes the fence problem one of the most important, says the Chicago *Times*. It, however, interests most of the farmers, who have the bulk of the labor to perform and expense to meet, and the timber to furnish for their consumption. The consumption of the timber for this purpose interests nearly every philanthropist. It is reported that Kentucky requires annually ten million trees to keep up her "national fence," the old Virginia rail. The census bureau of 1880 shows an expenditure of nearly $89,000,000 on fence buildings and repairs in 1879.

WHY BE DOWNCAST?—True, you may be in a miserable condition—you may be weak, pallid, and nervous. You cannot sleep at night, nor enjoy your waking hours; yet, why lose heart? Get a bottle of Burdock Blood Bitters. It will restore you to health and peace of mind.

TAKE YOUR CHOICE.—You can be weak, nervous, debilitated, and despondent, disqualified for work of head or hand, or you can enjoy a fair share of health and peace of mind. Burdock Blood Bitters will alleviate your misery and do you a world of good if you will persevere in their use for a few weeks.

THE MICHIGAN FIRES.

There has been just issued from the signal service office at Washington a report on the forest fires in Michigan in 1681. It is a comprehensive and well prepared work, filled with many facts which are unfamiliar to the reader living in the vicinity of the devastated district. Our readers are familiar with the main facts of that seething, devastating, life and property destroying conflagration which swept over four counties in three days, but they are possibly not so well acquainted with the facts in detail or the causes to which the fires were attributable. The work just published says the extent and irresistable power thereof are largely due to atmospheric conditions which are considered worthy of explanation in the work alluded to, and the which conditions were so favorable to the spread of the flames, which destroyed two million dollars worth of property and 125 lives in the territory lying between Saginaw Bay and Lake Huron, and Tuscola, Sanilac and Lapeer counties. Although the fires had been burning more or less extensively for several days previously, the work of devastation and death did not begin until Monday, the 4th day of September, at which time the flames were driven by strong, changing winds that grew to be gales as the flames advanced. The spreading of the flames in Sanilac county are put down as the direct result of the passage of a thunder storm over the peninsula. Of course, to be added to the atmospheric causes alluded to, are natural and local causes, which are mainly responsible for the destruction, in the shape of a protracted drought, dried and withered grasses, acres of "slasbings," dry pine tree tops, and other inflammable material. But the causes and the history of the forest fires, which are of so recent occurrence, is familiar, and need no repetition here. We all remember when the appalling disaster became fully known, how the great, generous heart of the nation throbbed in response to the urgent demands of the grief-striken people, whose homes had been desolated. And while it is less than two years since the fiery scourge levelled everything in its track, the waste places have all been repaired, and through the munificent liberalty of a generous national offering the people are actually in better condition to-day than previous to the horror, and possibly better off financially than if the fire had never occurred. But outside of this there is a dark mantle still hovering over that burned district which it will take many years to efface, and which the liberality of the people, no matter how munificent, can never entirely obliterate. The memories of the loved and lost still linger with those remaining, and the impress of sorrow still marks the downcast, weary expression of the mother weeping for her little ones, but who can find no consolation or comfort. The work just issued by the government which has called for these reflections, is a brief, detailed history of the forest fires of Michigan which in after years will be valuable for reference because of the minuteness of detail.—*Lumberman's Gazette.*

COMPETING PINES.

The *Northwestern Lumberman* says:—It is the common hope of Southern lumbermen that the exhaustion of northern white pine will be a speedy process, for on this, they think, largely depends the rise of the lumber industry of the South. After many of the present owners of yellow pine and the mills for sawing it, are in their graves, the Michigan, Wisconsin and Minnesota saws will continue chewing up the virgin pine in those states; yet the increasing use of the southern variety does not depend on the extinction of its white rival. At the rate white pine is now being worked up, it cannot be many years before the better qualities will have become less plentiful in the market, and resort to other woods for finishing purposes will become more general than now. Gradually, as the hardwoods will have to be more and more depended on for finishing, yellow pine will increasingly enter into use, but it will be along time to come before yellow pine, for coarser and commoner uses, will not have to compete with the white and lighter, consequently more portable, variety For such purposes it will win a place mainly on account of its strength and durability, where such qualities are most desirable.

Chips.

THERE are 340 kinds of timber on the North American continent. The Dominion of Canada has 90 varieties—60 east of the Rocky Mountains, and 30 on the western slope.

THE Winnipeg *Commercial* says that a gentleman, just returned from the Shell River country, says that Mr. Crerar has nearly three million feet of lumber cut, which will be floated down to Brandon. On Bud Tail Creek, Nelson & Mackenzie have taken out about the same amount.

A DISASTROUS forest fire is raging on the Marshfield Plains, Mass. Three thousand acres of wood land have already been destroyed. Two hundred men are unable to control it. Several dwellings are in danger. It is supposed it caught from a match thrown among the leaves by a smoker.

THE Waubaushene correspondent of the Midland *Free Press* says that the large addition to the mill has been completed, and it is expected that the manufacture of lumber will be on a much more extensive scale than previous seasons. The Waubaushene mill is the finest in the Georgian Bay district.

TYREE RODES brought to Pulaski, Tenn., lately a monstrous burl that is on a log six feet long and three feet in diameter. It extends three-fourths of the way around the log, measures 16 feet in circumference, and weighs 4,500 pounds. It was found in Marshall county, and it took a six-horse team to haul it here. As such burls are valuable for veneers, Mr. Rodes thinks he has struck a bonanza.

THE *Timber Trades Journal* says:—It is now generally believed that the Government is about to authorize the Dock Company to so amend its charter as to enable it to substitute a wooden dock for the proposed stone dock at St. John's, Newfoundland. The *Colonies and India* says: "Mr. Simpson, the American patentee of the wooden class of dock, has arrived there for the purpose of taking the matter in hand."

THE *Monetary Times* says that the Amherst, N. S. wood-working firm of Rhodes, Curry & Co. are still adding to their premises, their latest addition being a building 60 feet by 30 for store rooms and show room. They make a specialty of church furniture, altars, and also hardwood mantels, veneered doors, etc., etc. They are making a second shipment to Newfoundland of a lot of doors, newell-posts, mantels and wainscotting.

THE *Northwestern Lumberman* says:—The tide is already flowing into Manitoba, and before the season closes it is certain that that province, as well as the Northwestern territories, will have received a large addition to their populations. Judging from Winnipeg advices, though there will be a vast amount of lumber wanted in that region during the season of activity in building, there will be plenty offered both from home and American sources of supply.

THE *Lumberman's Gazette* says:—There is an undoubted inclination among the lumber manufacturers whose product has heretofore been tributary to Chicago to ship their lumber direct to the points of consumption. The prospect for bearing or controlling the market on the part of the dealers, who are not manufacturers in that city, therefore is growing beautifully less, and will probably continue to become more improbable, if the determination of the manufacturers alluded to above is persisted in.

Although millions of feet of timber per year have for many seasons been taken from the northern forests of New Hampshire, it is stated that so rapid is the growth that there is probably an acreage of timber very much greater than that of twenty-five years ago, land which at that time was used for tillage being now entirely covered with a healthy growth of small trees, which in a few years will be placed on the market; while to the west, stretching toward Moosilauke, and to the east, as well as up to the "east branch" of the Pemigewasset, which, it is expected, the new railroad will follow in its course to the Fabyan House, lie thousands of acres of heavy "old growth" timber, which will prove to some one a greater bonanza than many a western silver mine.

WE have received the first number of *The Lumber Trade Review and Builders' Journal* published in New York. It is full of valuable information, is well arranged and neatly printed.

THE Belleville *Ontario* of May 2nd says:—The Grover has cleared with lumber for Oswego from the Eagle mill. The Grant and Belle of Hamilton, are still loading at this dock. The rate to Oswego on lumber from this mill is now only 80c. per M.

THE *Canadian Pacific Railway Register* says: The cost of lumber consumed by the road was over ten millions of dollars. Sixteen million feet of this lumber were brought from Minneapolis and it cost in Minneapolis $300,000, which altogether with the duty and freight would make it cost over $550,000. Six million feet of lumber were brought from Keewatin. This cost at the rate of $25 per thousand feet. Material to the value of $250,000 has been brought to the recently erected storehouse adjoining the works.

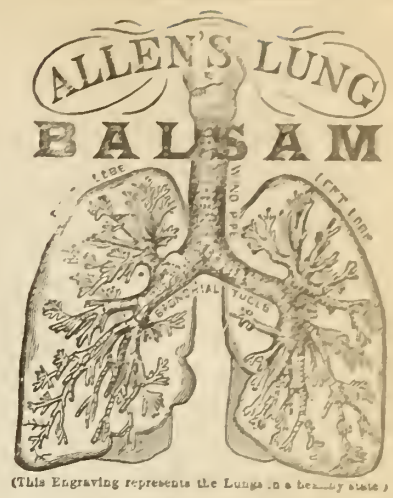
THE *Mail* says that owners of lumber vessels found it difficult to express their indignation toward the Alcona and tow for cutting the rate on lumber to Buffalo. Several charters at $2.50 were nearly made, with every prospect that that would be the opening rate, when the Alcona sailed in and accepted $2. The action would not cause so much disgust but for the fact that the Alcona was chartered to carry iron ore all season, and only wanted one cargo, in her eagerness to get which, she spoiled the chances of those who are regularly in the lumber business,

THE *Lumberman's Gazette* says:—If mill men all over the country would adopt the same system as those of Muskegon, and run their establishments only ten hours a day, it would be better for themselves and all concerned. Less hours, greater care in production, and economy in many places where extravagance usually prevails, will produce a cleaner, finer grade of lumber, and prevent any material reduction in the mill profits. This policy will also maintain prices, not only in the better class of lumber produced, but also in reducing the supply and proportionately thereby increasing the demand.

Mr. R. C. Fraser, inspector of ties and timber for the C. P. R., says there is piled along the Thunder Bay Branch, waiting for transport to the west to be used in construction, over 1,750,000 ties, besides piles, lumber and other materials to be used in construction. Some 3,000 men were engaged during the winter in getting out these material. These will now go out on their homesteads, or west to work on construction. The ties are worth 30 cents each delivered on the railway. They are of good quality. The value of the materials now on the track is about $1,000,000. Materials to the value of $300,000 are to be delivered.

THE *Canadian Pacific Railway Register* says: Fifteen miles east of the Red River at Emerson the line of continuous forests is reached—woods of almost impenetrable thickness—comprising all the varities of the Lake Superior region. West of the Red river to the Pembina mountians the various streams which drain this region sustain a fine growth of oak, poplar, elm, cottonwood and ash-leaved maple, Southern Manitoba being much more heavily timbered than the central or northern portion of it. Timber culture on the prairie is already carried on to a considerable extent, and in a few years quite a large quantity will be raised on "tree claims."

THE *Northwestern Lumberman* says:—In the county of Russell, Manitoba, 275 miles northwest of Winnipeg, 2,000,000 feet of lumber has been sawed and sold to the settlers for cash during the last two years, at an average price of $30 a thousand. This year 6,000,000 feet of logs are being taken out for local consumption. The operations connected therewith have employed men at $30 a month, with board, and for teams a corresponding rate is paid. Nearly all the supplies for the camps have to be teamed from Brandon, 200 miles distant, the teams earning $6 to $8 a day. These facts illustrate the energy with which settlement and improvement are being prosecuted in the Canadian Northwest.



(This Engraving represents the Lungs in a healthy state.)

THE REMEDY FOR CURING

CONSUMPTION, COUGHS,

COLDS, ASTHMA, CROUP,

All Diseases of the Throat, Lungs and Pulmonary Organs.

BY ITS FAITHFUL USE

CONSUMPTION HAS BEEN CURED

When other Remedies and Physicians have failed to effect a cure.

Recommended by PHYSICIANS, MINISTERS AND NURSES. In fact by everybody who has given it a good trial. *It never fails to bring relief.*

As an EXPECTORANT it has no Equal.

It is harmless to the Most Delicate Child.

It contains no OPIUM in any Form.

☞Directions accompany each bottle.
☞For sale by all Druggists.

PERRY DAVIS'

VEGETABLE

PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains. Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

DICKSON'S

EXTRACT OF WILD

STRAWBERRY

Cures Cholera, Cholera Morbus, Dysentery, Cramps, Colic, Sea Sickness and Summer Complaint; also Cholera Infantum, and all Complaints peculiar to children teething, and will be found equally beneficial for adults or children.

FOR SALE BY ALL DRUGGISTS.

T. MILBURN & CO.,

Proprietors, Toronto.

Market Reports.

TORONTO.

From Our Own Correspondent.

MAY 9.—There is considerable activity in the building trade in this city at present, although the boom is not yet up to the mark anticipated by many persons previous to the opening of the spring. Why this should be so it is difficult to say, when we take into account the fact that the demand for houses is brisk, and real estate agents say they have never had a better demand for property both for rental and purchase, and it is not going too far to say that more real estate has changed hands at remunerative figures during the last month past than during any previous month in the history of our city. This being the case, it may fairly be concluded that the opinions held by parties best fitted to judge in such matters that the remainder of the season will be one of increasing activity in building operations will prove correct.

On making inquiries of the various retail lumber dealers throughout the city, I find that nearly all give the same answer, viz., fairly busy.

In the wholesale market here the same condition of things exist to which I referred in my last letter—a continued glut of certain lines and grades of lumber, and I presume it is of but little use for one individual like your humble correspondent to reiterate, from time to time, through the medium of this journal, or otherwise, the advantage that might be gained, by wholesale dealers more especially, by organized action in all matters pertaining to their business interests. I need not go further than to point to the present position of the trade here, in order to illustrate the folly of continuing to act in a haphazzard style. One dealer takes a notion and ships forward from the mills to this market 200 or 300 M. of stock boards, another dealer does the same thing, and this is repeated in one or two other classes of lumber, and the consequence is a glut in the market, and no inconsiderable portion of such shipments have to be disposed of at a sacrifice. And yet how easy it would be to avoid this loss by united action amongst all the dealers, and which can only be obtained by a knowledge of the stocks held by each dealer and the wants of the market; in fact, call it by what name you like, there must be some means whereby interchange of opinions and matters of vital interest to the trade can be discussed, and if such is not the case things will go on in the same happy go lucky style as heretofore. Quotations at the yards remain the same.

MONTREAL.

From Our Own Correspondent.

MAY 9.—Monday last was the day appointed by the Lieutenant-Governor of Quebec as "Arbor Day" for this section of the Province, and was pretty well observed by the Corporation and the schools in the city, the former planted some 600 trees, and, as *might have been expected*, in places and under conditions where *they were not wanted*. In country districts, and where planting was really wanted and would be a decided benefit, the day was quite ignored, and on making enquiries of nurserymen and others who have forest trees for sale we could not hear of a single plant having been sold. Our country population will require to be schooled into this sort of work before they will enter heartily into the matter.

Business here has been rather dull the past two weeks, owing to the boats with lumber being so slow in coming to hand. The Export Lumber Company have received seven boat loads, but this is all that has arrived so far this season. The building demand has been fair and it is expected that a rushing trade will be done this spring. The difficulty in supplying American buyers with the kind of lumber they wanted, which was experienced in the winter, seems to prevent the same class of buyers from coming near us now, but as large quantities of lumber for that trade has been manufactured this winter, they will soon find ample stocks to select from when they again pay us a visit. Prices are steady and unchanged as under:

Pine, 1st quality, ℔ M	$35 00@40 00

FREIGHTS.

So far as the season has gone there have been no vessels taken up, either here or in Quebec, to load lumber for the River Platte. The rate of freight for deals to the United Kingdom is 60s. @ 67s. 6d., according to the port, 67s. 6d., has been paid to London and 65s. to Liverpool.

CORDWOOD

Has been in rather slack demand since the date of our last report. There has not been much brought in by boats, and what has come is chiefly soft wood, so that prices are well maintained, but it is expected that a fall of 50 cents per cord will take place during the next two weeks, although Upper Canada dealers are asking more for their wood than they did this time last year. We quote ex cartage:—

Long Maple	$ 6 50

Long Tamarack	4 50
Short "	4 00

WINNIPEG.

The *Commercial* of May 8th, says:—The trade in lumber has not been so brisk during the past week as might have been expected. There still remains an unsettled idea in the minds of contractors and a belief that lower prices will be secured ere long. On the other hand the dealers have a heavy stock on hand, and some are feeling the pressure of the same. The same unsatisfactory state of affairs noted in our last report exists regarding prices. There is yet no regular scale, and quotations of a reliable nature cannot be given. Prices are fixed according to the anxiety of the dealer to sell, and the purchasers have to search for who will sell at the lowest figures. The opening of the C. P. R. to Thunder Bay will no doubt do away with a great share of this cutting and bring matters to a regular system of reliable quotations.

CHICAGO.

The *Northwestern Lumberman* of May 5th, says:—An opinion has got abroad that lumber last year was too high in comparison with other commodities, which have settled in value, and there is a general inclination to sell for less money, and a determination to buy for less or not all. One note is sounded on this question from the salt sea to the mountains beyond the plains. The distributing trade has already lowered the value of yard stocks from $2 to $3 below last year's prices, and apparently intends to sell at that range, in any event. Now it demands that the holders of bulk supplies shall do the same. Really the latter have conceded a lower level of values, though they make a show of demanding last year's figures. In this market the drop on piece stuff between the two Mays is from $11.75 to $10, and as much as $1 on boards and strips. This is in actual transactions on this market, and is a foregone conclusion. In the Northwest the logic of events has decided that lumber is cheaper than it was last year, and it will do nobody any good to stout it out against that conclusion.

Receipts of lumber, shingles, etc., for the week ending May 3, as reported by the Lumberman's Exchange:

BOSTON.

Cotton, Wool and Iron of May 5, says:—There a very good demand for general lumber for building operations, and the market holds along on quite a firm basis, especially on choice western pine. Receipts by rail are closely taken up, and there are not many cars of really good lumber left in store. The spruce mills are quite well supplied with orders, and the market is maintained steadily. Hardwood are receiving a fair inquiry, and desirable and select grades seem to hold their own quite fully. Walnut is mainly in demand for furniture, and receives only a moderate call. Other kinds of hardwood are firm and in steady request.

LIVERPOOL.

The *Timber Trades Journal* of April 28th, says:—There has been little worthy of notice since your last issue concerning the general condition of trade. There is still the same monotonous cry of the want of life in the market, which is not relieved by the dry and open weather so necessary for the prosecution of building operations, although one would naturally assume from the numerous buildings that are being run up in this neighborhood, especially in the northern suburbs of the city, that some spirit would be infused into the trade. This, however, does not seem to be the case, although it cannot be denied that there is a firm consumption of timber going on.

The auction sales of last week included amongst others that of Messrs. A. F. & D. Mackay, who on Thursday last offered one cargo of St. John, N. B., spruce deals lying in store, and one cargo of St. John, N. B, birch timber and deals "to arrive," and in addition other parcels of spruce and pine deals from various port already on hand. There was a moderate attendance of buyers present, but the competition throughout was only languid, and consequently a large portion of the stored cargo of spruce deals was withdrawn. The St. John, N. B., birch timber consisted of two parcels, one brought down from the woods by railway, and one rafted down in the customary manner. Both lots sold fairly well, but prices were upon the whole easier all round than in the previous sales. Prices were somewhat irregular, as will be seen from the following particulars:—

St. John, N. B., birch timber unfloated—

20 to 21½ in. deep	25½d.	per ft.
17½ " 19½ "	23d.	"
18½ "	21d.	"
18 "	20½d.	"
17 " 17½ "	20d.	"
16 " 16½ "	19¼d. to 19½d.	"
15½ "	18d. to 19d.	"
14 " 15 "	18d.	"

The ordinary timber sold as follows:—

St. John, N. B., birch timber floated—

under 14 in. deep	16¾d.	"
20 to 23 "	25½d.	"
19 " 19½ "	21½d.	"
18½ "	20½d.	"
18 "	19¾d. to 20d.	"
17½ "	19½d.	"
17 "	19½d.	"
16 " 17 "	18½d. to 18¾d.	"
15½ "	17d. to 18d.	"
15 "	17¾d. to 18½d.	"
14 "	17¼d. to 17½d.	"

GLASGOW.

The *Timber Trades Journal* of April 28th, says:—Pitch pine timber has during the past few weeks has been arriving at Greenock pretty freely, and this year's import to date is now coming close on last year's total for corresponding period, the figures being: 1882. tonnage employed, nineteen vessels, 14,287; and 1883, fifteen vessels, 12,497 tons. The stock on hand at the end of March last was, of hewn timber, 4,639 loads; sawn, 10,734 loads; and planks, 240 loads. A cargo of pitch pine planks is included in the Glasgow imports of the past week. The arrivals of teak timber to Clyde

since the beginning of the year are represented by a carrying tonnage of 6,238 tons, as compared with 10,108 tons in same period 1882. The stock of teak at the end of March last was 4,703 logs, 4,106 loads, part of which (793 logs) was in consumers' hands.

Of the parcels of wood goods regularly arriving per steamship, staves form a large item. There have been about 230 mille imported here from the States since the beginning of the year, about the same quantity as in 1882. The stock in yard at present consists principally of barrel staves. Last month the deliveries of staves from yard amounted to 45 mille. Parcels of American walnut logs and whitewood, &c., keep dropping in per steamer. Of walnut the import since the beginning of the year is about six hundred logs. There are very few logs on hand at present and prices good.

AUCTION SALE.

On 19th inst., at Greenock, Messrs. Alison, Cousland & Hamilton, brokers :—

Quebec waney boardwood—		
30 c. ft. av. per log	1s. 4½d.	per c. ft.

Prime sawn pitch pine—		
25 & 30 c. ft. av. per log	1s. 2d. & 1s. 2½d.	"
Florida oak 7 logs 1st class	2s. 5d.	"
Bangor spruce deals—		
14 & 15 ft. 9×3	10¾d.	"
22 to 31 " 7×3	10½d.	"
12 & 13 " 7×3	9¾d.	"
5 to 23 " 6/8×3	9½d.	"

LONDON.

The *Timber Trades Journal* of April 28th, says:—Apparently the turning point of the market has not yet been reached, and the expected improvement in prices so long counted on by the shippers seems as far off as ever. Looking to the stocks only, we certainly see no reason why an upward movement in values should not take place, and it is fair to assume that there must be other causes operating apart from the state of the supplies to sustain the indifferent attitude importers all over the country still display towards entering into fresh engagements. There can be very little question but that the present is a most severe crisis through which the general trade of the country is passing, and while the great manufacturing centres are comparatively inactive it can hardly be expected that other and independent industries can escape the depressing influences at work.

While the large body of importers continue to experience a falling off in the consumption they can hardly feel inclined to make fresh purchases on a larger scale than the actual exigencies of trade demand. To this is attributable what under other circumstances might be termed the ridiculously low counter offers they make when goods are put before them, and which, though seemingly anxious to sell, shippers do not yet see their way to accept. Of course, if no reaction to the present state of trade takes place, cargo values must come down, but we are not without hopes that before long the market will take a favorable turn. There is the chance of farming prospects improving and coming to the assistance of trade, which requires some stimulus to set it going again, and the outlook in this direction so far is favorable to a good harvest. Whatever shape the spring trade may assume, signs are not wanting of considerable activity during the summer and autumn.

Whatever appearances of apathy may prevade the cargo trade here, there can be no dispute about the present active state of the deliveries from the docks, and this, if it means anything, ought to indicate a good business doing in some direction or another.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* says:—This port, as well as the harbours south hereof, may now be considered open for both steam and sailing traffic. Our friends in Norrland report that open water may be anticipated south of Hernosand between the first and the 10th of May, unless a succession of heavy weather from the north and east should drive the ice from the Finnish side and block up the entrances to our harbours; in which latter case it may be after the middle of next month before the ports in question are accessible to sailing vessels. The ice is reported to be of a respectable thickness about Sundswall, but rapidly becoming porous, so that it is unlikely that much damage will be occasioned to vessels coming in contact with the same.

The improvement in the sawn wood trade reported in my last advices has scarcely been maintained, owing to the action of one or two firms from the Lower Gulf, who have disposed of the cream of their stocks at high prices on the Continent, reducing their prices about 5s. per standard for what they have left. This action, although quite intelligible, has checked the ardour of buyers, who were only too glad to take advantage of the opportunity to endeavor to obtain a modification from other sellers. Notwithstanding this appearance of reaction on the surface, the intrinsic position of the trade is better than it was a month or two ago, and for redwood stocks, containing a fair proportion of mixed, full list figures are likely to be available before long, whatever may be the case at the moment. Swedish whitewood is in somewhat better demand for both Scotland and the Dutch ports, but prices offered are low and unremunerative.

AMERICAN vs. ENGLISH FORESTS.

There is a certain wildness in this country, known to hunters, fishermen and campers out, that any suggestion or relic of man profanes. It is found mainly in our woods. In England it is to be looked for rather in the solitudes of the moors. The pastoral or field life of nature in that country is so rank and full that no woods or forests that I was able to find could hold their own against it for a moment. It flooded them like a tide. The grass grows luxuriantly in the thick woods, and where the grass fails, the coarse bracken takes its place. There was no wood spirit, no wildwood air, as with us. Our forests shut their doors against the fields, they shut out the strong light and heat. Where the land has been long cleared, the woods put out a screen of low branches, or else a bushy growth starts up along their border that guards and protects their privacy. Lift or part away these branches, and step inside, and you are in another world—new plants, new flowers, new birds, new animals, new insects, new sounds, new odors, in fact, an entirely different atmosphere and presence. Dry leaves cover the ground, delicate ferns and mosses drape the rocks, shy, delicate flowers gleam out here and there, the slender brown wood-frog leaps nimbly away from your feet, the little red newt fills its infantile pipe, or hides under a leaf, the ruffled grouse bursts up before you, the grey squirrel leaps from tree to tree, the wood-pewee utters its plaintive cry, and sooner or later the mosquito demands his fee. Our woods suggest new arts, new pleasures, a new mode of life. English parks and groves, when the sun shines, suggest a perpetual picnic, or Maying party; but no one, I imagine, thinks of camping out in English woods.—*John Burroughs.*

THE Rogers Lumber Company has lately completed a narrow gauge road from Seney, Ga., on the East Tennessee, Virginia and Georgia road, thirteen miles south of Rome, south by west to Deaton, on the East and West road. It is nine miles long, and was built chiefly for carrying lumber, but passenger trains are also run on a regular schedule.

THE Kingston *News* says that J. P. Tett & Bro., of Bedford Mills, cut upwards of 1,000,000 feet of timber on their limits in Bedford township during the past winter. They are running their mills night and day, cutting every 12 hours an average of 20,000 feet of lumber, for which there is a good demand. All their lumber has been sold. The steam barge Edmund and her consorts will carry the lumber to Ogdensburg.

THE New York *Lumber Trade Review* says that California redwood is rapidly coming into favor here. There is a large demand springing up for carved panels, and workmen are learning to contrast white oak, cherry, sycamore, bird's-eye maple and ash with polished redwood, whose warm gleam of golden red is so cheerful in winter. Mahogany, redwood and oak, set off with polished brass fittings, form a handsome and much used combination for fine office finishing.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,

C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1YL7

ABOUT 2,300,000 feet of logs, from the White Mountain region, are in the river near Tilton, from which point they will be floated to the pulp mills, two or three miles down the river, ground into pulp, and converted into paper at the rate of 20 cords per day.

BLODGETT & BYRNE, of Muskegon, are making surveys for their proposed logging road from the Muskegon river to Portage Lake, Michigan, a distance of 20 miles. Eight miles of the line will be built this season. The route is through a large tract of pine owned by the firm. Some of the iron for the track is now at Roscommon.

THE New Orleans *Times-Democrat* says:—"The continued purchase of government pine lands in this section promises before this year has been completed to leave none for future entry. Cases are at hand where over 100,000 acres have been entered in the state of Mississippi during the last 30 days, and from reliable information the prospect for a scarcity in the log crop is imminent.

ON April 26 it was Arbor Day in Michigan. The legislature of the state has named that day as "arbor day," and set apart one fourth of the highway tax to be expended in setting trees along the highways, 60 feet apart. Each taxpayer, if he prefer, can work out one-fourth of his road tax in tree-setting.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably, Address TRUE & Co., Augusta, Maine.

FORESTRY OF THE MISSISSIPPI VALLEY.

During the recent session of the Minnesota Horticultural Society, in Minneapolis, Hon. F. P. Baker, Commissioner of Forestry for the United States, and editor of the Topeka, Kansas, *Commonwealth*, read a paper upon "The Forestry of the Mississippi Valley and Tree Planting on the Plains," which we would like, because of its excellence, to reproduce in full. Its tenor and the line of argument pursued can, however, be appreciated by our readers as they peruse the following extract :

Mr. Baker divided his subject into three parts, as follows:

First—The natural condition of the region, as found by the early settlers, or "what nature did."

Second—The changes that have been wrought by the progress of settlement, and through the agency of individuals and the national and state governments, or "what man has done."

Third—The question of future development of forestry, with some few practical suggestions as to the duty of individuals, corporations, and the state and national governments, or "what should be done."

After describing the plains as they were before settlement by white men, and showing what man has done, discussing the timber culture act, and showing what had and could be done, the speaker turned to his third subdivision.

He argued that the government had as unquestionable a right to protect the timber upon its domain as it had to protect the capitol at Washington, or the vessels carrying the flag of the United States ; to prohibit spoliation by the early settlers under the plea that useless and almost criminal waste "develops" the country. The custom of removing the timber from Government land for domestic use, and the abuses which followed in every portion of the country, were detailed at length—abuses in which railroads and saw mills participated largely. Near one Colorado town, and within a radius of ten miles, sixty charcoal kilns are running, with a capacity of 4,000 bushels each, per month, representing a monthly distribution of 240,000 bushels—all the charcoal being made from wood belonging to the United States, which receives no compensation of any kind ; and the actual settler is compelled to travel much longer distances for fuel in consequence of this reckless and unlawful destruction, The situation along the eastern slope of the Rocky Mountains, for as far as occupied by miners or penetrated by the railroad tie cutters, was fully illustrated, and Mr. Baker then turned to the question how the forests may be protected, deeming as the most efficient means the appointment of government foresters, to be composed of young, energetic and practical men, educated by the government, and the establishment of experimental farms, the schools to be distributed in different sections of the union, according to climatic division and the character of their natural forests. He believed in different systems of culture and irrigation in different localities, and results noted through a series of years—and in this work the government, people and railway companies might profitably combine. The government of the United States, being the largest land-holder, also has a paramount interest in reclaiming this empire and converting it from a wilderness to fields, gardens, orchards, forests and pastures. That the government should actually do the work is not to be expected, but it seems to be reasonable to expect that it should aid in doing it. Knowledge is power ; and let the government furnish the knowledge. The government owns the land ; it can set apart any amount of it which may be required ; it can place the work in the hands of the best practical talent in the country ; it can do on a large scale what individuals are doing on a small scale. As the government is impersonal and can be accused of no selfish or sinister interests, the statements put forth under the sanction of the government officers and agents will be accepted as the truth. It will be shown what trees can and what trees cannot be grown on the plains, what are the effects of copious and unlimited irrigation ; what is the actual amount of water required for given areas ; what is the result of irrigation on the same land for a series of years ; and, most important of all, what is the effect of planting large bodies of trees—actual forests.

The speaker next discussed the importance of adopting an amendment to the timber culture act, based on the theory "once a timber claim always a timber claim,"—that is, when a filing is under the timber culture act, the land should be withdrawn from entry under the homestead or pre-emption acts. The best method of planting trees—four feet apart instead of twelve, as under the law—the importance of cultivating timber on homesteads, the work which may be done by states and railway companies, were discussed in succession, after which Mr. Baker pointed out the duty of the people generally to cultivate forests, concluding his address as follows :

Much sentimental talk has been indulged in concerning our duty to the next generation. We should plant trees, it is said, under which our grand children may repose. This is doubtless a fine and ennobling sentiment, but the avorage American citizen cares little for the generation preceding him, and nothing for the one to come ; he expects the next generation to provide its own shade. The question he wishes to determine is whether the trees he plants will benefit men in this generation. Curiously, people almost always overestimate the age of trees. Who has not heard a great elm or oak spoken of as centuries old, when it really has grown within the life time of living men? Trees are a sure crop, and, after all, a quick crop. The homesteader who goes out on the raw prairie knows that it is five years before his farm can be producing crops with anything like regularity. His trees are making a return as soon as his fields are. The Mennonite settlers in Kansas, of whose success we have spoken, in seven years, at the farthest, from the time they turned the first sod, are literally sitting in the shade of the trees they planted ; are raising their own firewood, and eating the fruit of their own mulberry trees. What these settlers from Russia, strangers to our climate and soil, can do, others can do. It must be remembered, too, that the objectors have had their day ; every argument which can be used against the cultivation of forest trees has been used in the prairie states west of the Mississippi against the cultivation of fruit trees. For example, men accustomed to hillside orchards in the old states have demonstrated to their own satifaction that apples would not grow in Kansas ; but wagons full of round and rosy evidences to the contrary may be seen standing in the streets of every Kansas market town. The number of those that till the soil, be it a bit of garden ground or acres by the hundred, who believe in the profitableness of trees, is constantly increasing. In front of the humblest cottage in town you see the three or four maples or elms covering the front of the lot ; and out on the wide prairies, as far as settlement has extended, the group of planted trees marks the outpost of the picket guard of civilization. It is with the hope of contributing in some way to this useful and and beautiful pursuit, which is to shelter the bare and blistered earth ; which is to catch and hold the rain and the dew ; which is to shelter the home and its occupants from summer's heat and winter's cold ; which is to bring fuel and comfort to the housewife ; and which is to increase by millions the well-earned wealth of a nation, that this paper is submitted.—*Wood and Iron.*

DURABILITY OF WOOD IN BUILDING.

Herr Weise, Forest-Inspector at Eberswalde (Germany), says a contemporary, has recently published a summary of his observations bearing on the above subject. considers that the system now usual for the supply of wood is in some measure to blame for the complaints which are from time to time made by experienced authorities as to the reduced durability of modern woodwork. He remarks that in the Middle Ages the whole of the wood for any large building was carefully selected from one spot, and after being felled was stored and dried together, a certain homogeneousness in the woodwork being thus obtained. Nowadays wood is used just as it is delivered by the dealer, coming from various districts and having been felled at different seasons, these circumstances causing a more or less marked divergence in quality. He remarks that the first tendency towards decomposition shows the disadvantage of using various qualities of wood together, and calls attention to the fact that microscopic observation of the approach of decomposition is not by any means as much used as it might be. He considers that the development of agriculture and the neglect of the judicious extension of forests have exercised an unfavorable influence upon the quality of wood in modern times. In illustration of this assertion he cites the fact that trees yielding 35-inch planks (such as are to be found in the castle of Fuessen) can only be exceptionally found even in forests under Government control.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of March, and for the first three months of the year :—

MONTH ENDED 31ST MARCH., 1883.

	Quantity.	Value.
Timber (Hewn).	*Loads.*	*£.*
Russia	288	2,343
Sweden and Norway	73,637	118,426
Germany	1,519	6,352

Total of Hewn and Sawn	464,407	1,443,889

Spruce Trees Dying.

BANGOR, Me., May 3.—It is reported from the lumber regions of Arostook that spruce trees are dying rapidly. Last winter the operations were on a part of the township where it was expected that 700,000 feet would be cut, but only 85,000 feet of sound spruce could be found. An examination shows that the spruce in the rest of the townships is in the same condition. As far as ascertained no worms are at work on the spruce, and the cause of the decay is a mystery. The tops of the dead spruce trees are of a reddish color, as though scorched by fire.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

FIRST RATE EVIDENCE.—"Often unable to attend business, being subject to serious disorder of the kidneys. After a long siege of sickness, tried Burdock Blood Bitters and was relieved by half a bottle," Mr. B. Turner, of Rochester, N.Y., takes the pains to write.

A FINE HIT.—When the proprietors of Burdock Blood Bitters put this renowned medicine on the market, they hit it exactly. They hit dyspepsia, indigestion, and liver and kidney complaints a hard blow, from which they will never recover.

AN EXCELLENT REPORT.—Hon. Jos. G. Goodridge, of Brooklyn, N.Y., writes :—"I cannot express myself in sufficiently praiseworthy terms of Burdock Blood Bitters which I have used for the past two years with great benefit."

EARS FOR THE MILLION

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the only Absolute Cure for Deafness Known.

This Oil is abstracted from peculiar species of small **White Shark**, caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410 Its cures were so numerous and **many so seemingly miraculous**, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!

It has performed a miracle in my case.
I have no unearthly noises in my head and hear much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

To avoid loss in the Mails, please send money by REGISTERED LETTER.

Only imported by **HAYLOCK & JENNEY,**

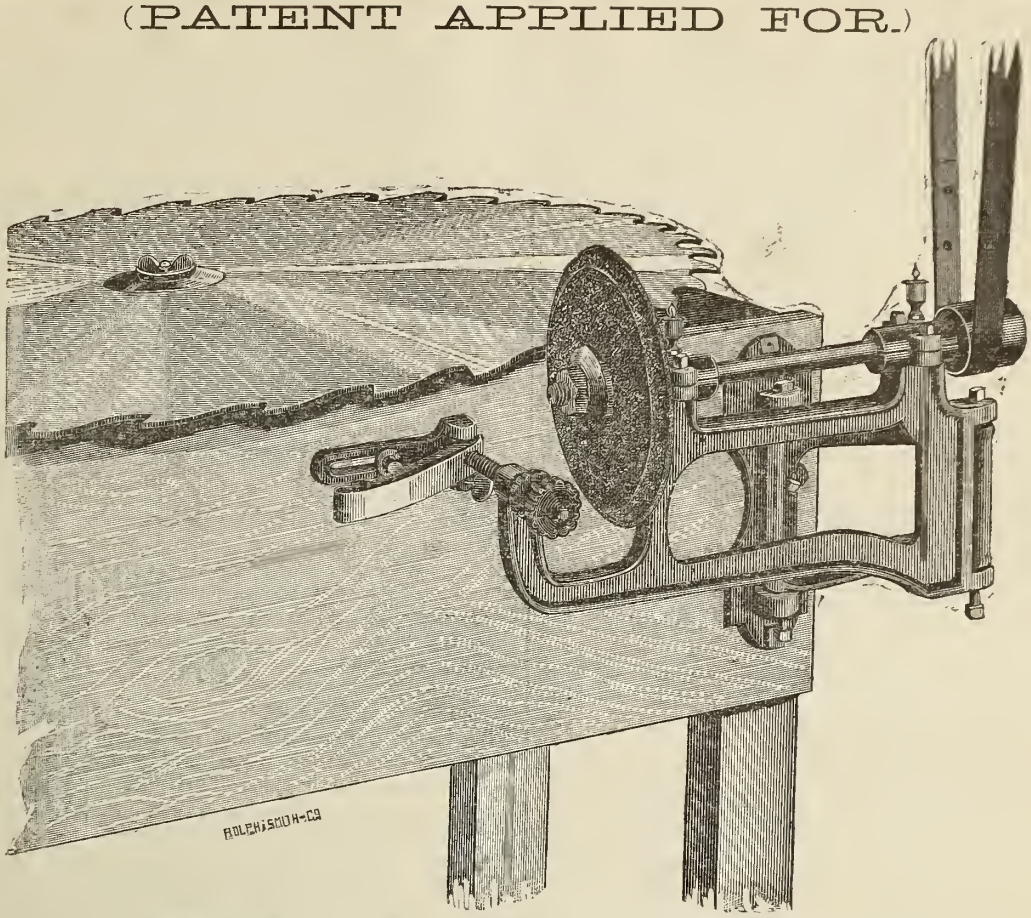
ROGERS' SAW GUMMER

(PATENT APPLIED FOR.)

No Heating!

Quick!

Simple!



Exact Work!

Cheap!

Complete!

POSITIVE STOPS! ADJUSTABLE GUIDE! Every Tooth made exactly alike!

JUST WHAT IS WANTED in every Saw-mill in Canada!

A REVOLUTION IN GUMMING SAWS WILL BE EFFECTED WHEREVER

ROGERS' SAW GUMMER

Is Introduced to replace Burr Gummers, or Grindstones, or where Emery Wheels have been run in the usual way. Every Machine Guaranteed to work as represented or No Sale. *It works EASILY; is so SIMPLE and COMPLETE that Sawyers can keep their Saws CONSTANTLY in FIRST-CLASS ORDER and thus LARGELY INCREASE the DAILY OUT-PUT.*

Price Complete, with Countershaft - - $40.00.

HART EMERY WHEEL COMPANY, Limited

HAMILTON, CANADA.

☞Manufacturers of **HART'S PATENT EMERY** and **CORUNDUM WHEELS.**

TIMBER OF THE U. S. NORTHWEST.

Practically, the whole country between the Minnesota prairies and the Rocky mountains is bare of timber. There are little strips of forest trees along the water courses in Dakota, but they consist mainly of cotton wood, soft maple, and alder, and furnish only a scanty supply of fuel to the settlers and are of no value as a source of building material. West of the Missouri there is nothing worth sawing into lumber until the advanced spurs of the rockies are reached—the Big Horn, the Belt, the Judith, the Big Snowy and the Yellowstone mountains. In the gorgos running up their sides there is sufficient "bull pine" and spruce for the settlers' purposes, and for railway ties and bridge timbers, but there are no large well-timbered areas. On both sides of the main divide of the Rockies about the same condition is found. The pines are somewhat larger, and some cedar is met with. For want of something better, the timber is of great value for local consumption, for fuel and building purposes in the neighboring valleys, but this is all that can be said of it. Not until I reached Clark's Fork of the Columbia, or the Pend d'Oreille, as it is known to the settlers, did I see any extensive body of good timber. On both sides of the stream, between the Cœur d'Alene and Cabinet mountains, lies a heavily timbered belt of about 100 miles in length by 30 miles in width, reaching down to and around Pend d'Oreille Lake. The trees are "bull pine," cedar, hemlock and spruce with a little white pine. The western slopes of the Cœur d'Alene mountains and the Bitter Root mountains, which are a continuation of the same range, are moderately well timbered and furnish material for fuel, fences and buildings for a wide stretch of rich, bare country further west. From these mountains westward, to the narrow valleys running up into the Cascade range, the country is nearly destitute of forest growth. A few stunted pines grow on the sides of the deep narrow valleys through which the streams run. Along the lower course of the Columbia and around Puget Sound there are immense forests of fir, furnishing a practically inexhaustible lumber supply. Eastern Oregon is almost treeless, but the slopes of the mountain ranges bear sufficient timber for local uses. Eastern Washington, fast becoming a great wheat field, feels most the lack of forests. Western Oregon, including the fertile, well-settled Willamette Valley, is well supplied from both the coast and Cascade mountains, while western Washington, is all a vast forest, where the clearings are mere specks upon the immense expanse of woodland. This magnificent forest is destined to be a source of great wealth for centuries to come. The lumbering operations up to this time, although very extensive, have only notched it here and there at long intervals close to the water side.—*E. V. Smalley in the Century.*

TREE PLANTING ENCOURAGED.

Though the prospects are very remote when this country will be called upon to seek its necessary supplies of timber in foreign countries, lumbermen should bear the fact in mind, that from other than a commercial point of view, our forests are of inestimable value. It has been proven conclusively that where forests abound droughts are entirely unknown; and there is no doubt that the character of the deposition of water in wooded regions is much more gentle, and therefore fertilizing, than in denuded countries, where long droughts alternate with short but violent rains.

The farming class of this country are fast awakening to this fact, and in numerous instances State Legislatures have been called upon to take action to encourage the setting out of young trees. Kansas has entered boldly into the spirit of the subject, and a day has been set apart in each year, when every citizen is expected to cast his mite, so to speak, into the treasury, by setting out one or more trees in his immediate locality. Iowa, not to be outdone in this respect, has bills before the legislature, offering a bounty to those who plant and maintain for a specified time a given number of young trees. As an illustration of the interest taken in the West in this movement, it may be said that a considerable amount of prairie land in southern Indiana and Illinois has been successfully converted into forest, and the natural adaptation of the soil for this purpose is shown by the fact that in a single square mile of wood seventy-five species of trees, or almost as many as are found throughout the whole continent of Europe, were observed to be growing. These seventy-five species included nearly all the varieties of valuable timber trees known, and specimens of fifty-one of them were found which were estimated to be at least one hundred feet in height.

This subject is of vast importance, particularly to the Eastern section of our country, and action should no longer be delayed. Droughts are becoming more and more frequent, and the effect upon the crops is illustrated at times in a manner not pleasant to realize or consider. Let "tree planting day" therefore be enumerated among the list of legal holidays, and instil into the minds of our young the necessity of providing for the wants of future generations—a duty mixed with pleasure.—*Lumber Trades Review.*

DANGER OF FOREST FIRES.

Now that the drying winds have commenced to shriek through the forests, drying the leaves scattered thickly over the ground throughout valuable timber lands, aided of course by the warm sun, care and precaution should be exercised whereby the customary damages by extensive forest fires shall be lessened or prevented entirely. The Philadelphia *Times* pertinently refers to the subject clearly and forcibly in the appended article:—

The usual spring floods are doubtless over for this season. The drying winds of the past few days have been preparing the way for another destructive agency, the spring forest fire. The most general and destructive of these usually occur during the months of April and May. The warm sun and drying winds render the last year's fallen leaves as dry and inflammable as a tinder-box. There is as yet no crop of green foliage even partially to counteract the dangers arising from the drying mass of combustibles. Of all the States in the Union, Pennsylvania probably suffers the greatest annual loss from this source. The mountain-sides are covered with much valuable timber, but the lumberman and the tanner are making sad havoc with our forests, and the methods pursued only prepare the way for a greater waste of timber by fire.

A last year's bark peeling or lumber camp furnishes the material upon which this year's forest fires will revel. When once started the flames do not stop with burning up the dried branches of fallen timber, but spread over miles of green and standing forests, causing untold destruction. It is stated on the authority of the last census that in the year 1880 alone more than 600,000 acres of Pennsylvania forest were burned over, with an immediate loss exceeding $3,000,000. The loss in increased sterility of soil and lessening rain supply is incalculable. After one of these fires in the pine or hemlock forests of the state there is very little grows but briers, fireweed, and a cold moss.

There are laws more or less adequate already on the statute book of the state for the suppression of these damaging conflagrations. But they will not execute themselves. The farmers and other forest owners must organize for that purpose or laws are useless. This should be done at once, in advance of the danger. In such a matter the value of the ounce of prevention is almost incalculable. Prompt and watchful attention on the part of all interested will prevent many forest fires in their inception, before which, when once started, the usual means of suppression would prove perfectly worthless. The preservation of our streams and the maintenance of the rainfall are of too much importance to the welfare of this commonwealth to be treated lightly. Add to these public considerations the value of the private property exposed to danger and sufficient motives are offered for the most strenuous efforts to prevent these annually recurring disasters to our forests. —*Lumber Trades Journal.*

A TIMBER SEIZURE.

There is not the least doubt about it; and a big one, too. Section B company for the past winter, have been doing an extensive business in the way of getting piles, timber, lumber and other materials. Some 3,000 men were engaged during the winter in getting out these materials, and there has been piled along the Thunder Bay Branch, waiting for transport to the west, to be used in construction, over 1,750,000 ties alone. These ties are worth 30 cents each, delivered on the railway, and are of good quality. The value of the materials now on the track is about $1,000,000, and materials to the value of $300,000 are yet to be delivered. The winter's operations have drawn to a close. It will be seen that a very large amount of timber has been cut by those cutting timber. But it is said that this company have not complied with this demand, and have not paid their license. But they are not going to be allowed to get of "scot free," for the department have given instructions to their agent here, Mr. Wm. Margach, Government Inspector of Timber, to proceed at once and seize all the ties and timber that has been cut by the aforesaid company, and Mr. Margach left here on Saturday last for that purpose. He took the train as far as Savanne, from which place he will take to the woods and seize everything that has been cut, posting up notices that anyone touching the materials will be arrested and dealt with as a person would be for stealing. His instructions are very emphatic, and he informs us that he intends carrying them out to the letter. Of course there will be a grand "kick" on the part of the company, but that is to be expected. Nevertheless the Government will hold firm until their demands are met. It may be claimed that the Ontario Government have nothing to do with the timber or lands in this disputed territory; nevertheless they intend to lay claim to it. This may be the means of a speedy settlement of the boundary dispute, as to which Province this territory belongs.—*Prince Arthur Herald.*

ARBOR DAY.

The Montreal correspondent of the Toronto *Mail* says:—The judicious appointment by the local Government of an annual "Arbor Day" has met with immense and most gratifying success, not only here, but throughout the whole province. Tuesday, May 7th, was a gala day both in the city and vicinity, and from the despatches published this morning Montreal has nothing to boast of as compared with other cities and the rural districts. In fact, it was observed as a fete day everywhere. There was a good deal of enthusiasm among those present when the the trees in the names of her Royal Highness the Princess Louise and his Excellency the Governor-General were planted on the mountain side here. All the *elite* present took part in the operation. The Mayor and corporation thoroughly entered into the spirit of the celebration. There is now no danger of our magnificent forests being wasted, since the whole population is enlisted in their preservation as well as perpetuation.

A Tell Tale.

The barometer in the lumber business that best tells the condition of the times is thick stuff. The demand for it increases as properity becomes greater, and diminishes as the people notice that they are being pinched. A man who puts up a house when he feels well-fixed and happy will use one and a half or two-inch doors, but if he feels for plenty of dollars in his pockets, and they are not there, he will content himself with thinner ones. Three or four years ago when we were emerging from the ruins of the panic, thick stuff was everywhere abundant, but now it is everywhere scarce, and it will remain so until hard times strike us again. Buyers of houses may take a hint from this. As a rule, if a house is built when money is easy, it will be better built in every respect, than though erected when the builder is uncertain whether his bank account will hold out against his lumber and carpenter bill.—*Northwestern Lumberman.*

Tree-Planting in Texas.

An exchange says that tree-planting in Kansas has made an encouraging beginniug. Two plantations, of 500 acres each, in Crawford county, illustrate what may be achieved in this direction. One of the plantations is conducted by the Fort Scott & Gulf Railroad Company, primarily to furnish ties and timber for its own use, and with a view to affect ultimately a great saving by this enterprise. The western catalpa appears to be the tree preferred for planting on the prairies. It is a native of the lowlands along the streams in Kentucky, Tennessee and Missouri. The wood is tenacious of life, is soft and almost indestructible, even when exposed to the weather, and has proved so durable that the farmers of Missouri, it is said, have nearly exterminated the species in their eagerness to secure it for fence-posts. It is also an exceedingly rapid grower. A block of 100,000 seedlings planted in the spring of 1879, on rich soil in the Fort Scott forest, already ranges from 10 to 15 feet in height, while the individual trees vary in circumference from eight to 11 inches.—*Northwestern Lumberman.*

A GRAND FORKS SCHEME.

A meeting of citizens was held at Grand Forks, Dak., April 26, for the purpose of considering a proposition of a Michigan party, whom the *Plaindealer* lazily calls "Mr." Howard, for building a mill at that point. The offer is to invest $500,000 in the enterprise, if the citizens of Grand Forks will subscribe a bonus of $50,000. It was stated that Mr. Howard spoken of was thoroughly responsible, and owned a $300,000 mill in Michigan—a statement that no man who knows the cost of sawmills can swallow. Before the meeting adjourned the subscription was raised to $20,000, and it was throught that the desired amount of local guarantee could be easily obtained. This is the first tangible effort that has been made to locate mills at Grand Forks for the manufacture of Red Lake pine, that will soon be opened by the government for sale. As Grand Forks is at the junction of Red Lake river with the Red River of the North, and at the very gateway of the immense demand for lumber in northern Dakota and in Manitoba, it is the natural manufacturing and distributing point for pine in all northwestern Minnesota. If the active men of Grand Forks do not take the opportunity that lies within their grasp they are sillier than they have a reputation for being.—*Northwestern Lumberman.*

THE Toronto *Globe*, in alluding to the death of Leonard Bacon Hodge, says.—There has just gone to rest from St. Paul, Minn., a quiet, unostentatious man who has probably done more real good than many who will find a place among the world's great ones. Ever since 1854 Mr. Hodges has been actively engaged forest-planting on the prairies of the northwest. From long experience his mind had been a perfect storehouse of facts concerning forestry. It was he who dictated the legislation of his state under which Minnesota is fast becoming a wooded country. He also founded the State Forestry Association. His work will endure for ages, and of him it may be truly said that future generations will rise up and call his work blessed.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

EMERY WHEELS FOR SAW GUMMING.

EX INUTILI UTILITAS
TRADE TANITE MARK

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

THE PRINCIPLES OF WOOD BENDING.

The following extracts are from a lecture delivered before the class in carriage drafting and construction connected with the Metropolitan Museum of Art Technical schools, New York, by H. G. Shepard, of New Haven, Conn.

* * You may go back as far as the antediluvian races, but though the art was known and practised away back, no progress was made, and principles which underlie successful wood-bending were unknown to them. Their method undoubtedly was, simply to bend a stick while it was green and hold it in that position until dry; and the first use to which they put this bending undoubtedly was to make bows with which they shot their arrows. Coming down from that time to the present we find but very little progress in wood bending until the introduction of steam. I may add that even now wood bending is yet in its infancy, for although the principle upon which wood bending must always be done has been discovered and is in practice to-day, yet its various applications have not been made to any great extent, and there are new discoveries constantly being made, Such discoveries have been made within the past year, which I believe will increase the amount of wood bending fourfold within the next ten years.

* * The first wood bending I have any recollection of was done by my mother, who, paradoxical as it may seem, used to bend me across her knee to keep me straight. The wood she used was always badly slivered and broken after she had finished, so that it was of no further use.

* * The use of bent wood, is probably still in its infancy. In my belief, we do not use to-day one piece where in ten years from now we will use four.

* * If I wished to bend a stick and have it remain in position and keep its shape the best, I should put the heart on the outside, for the reason that the tendency of the wood is to bend from the heart; but when I have a difficult piece of bending to do, like a corner-piece, that requires a great deal of upsetting and end pressure, without giving way, wrinkling or anything of that kind. That is the way I use the heart of a stick. When I wish a piece to remain in a certain shape, then I put the heart on the outside, because the tendency of the stick will be in the direction in which it is bent.

* * As to the peculiarities of bending, after a piece of wood is bent its character is almost entirely changed. It is wonderful how it is changed, and by that change it is better fitted for any use, I claim, than it was before. Bending makes the wood heavier; it is pressed together, and the same bulk of wood weighs more after it is bent than before. Another peculiarity is that when it is thoroughly dry, it is stiffer than the same sized piece of wood, that it is alike every other way in regard to grain. It will admit of more strain, and move less out of its position than a piece of wood that is unbent. On this account it is better fitted for carriage making than sawed pieces. I have taken two circles, one sawed out and the other bent, both of the same character of wood and as nearly alike as I could get them; I placed the concave sides together and put pressure on the ends to bring them in contact. They were subjected to equal strain. I found that the bent piece had preceptibly more influence over the sawed one, than the sawed piece over the bent one.

* * A piece of timber that has been steamed, whether it is bent or not, has its stiffness increased. It is more brittle than it was before, and, for some uses, it will not do as well; and yet there is a quality of timber that the steaming process and the kiln-drying process affect very much the same; they both cook the gum in the timber and make it brittle and stiff. There is a grade or class of hickory that is benefited by being steamed or kiln-dried for use as spokes or whiffletrees. There is a kind of hickory that never becomes stiff by a natural process of drying, and one of the desirable qualities of a spoke, rim, or whiffletree, is stiffness as well as strength; you take that hickory, and it is the very best we have, and steam it, and it is better fitted for these purposes than it was before. It is difficult to tear apart a piece of bent wood; the fibres are interwoven one with the other. We do not perceive the change on the outside, but when we come to split the stick open, we find that its character is entirely changed.

PLANTING TREES.

A few words about planting trees. It is a seasonable topic, and much might be said upon it. There are, of course, differences of opinion as to the best time for transplanting. Some maintain that spring is the proper time, and others say that better results are obtained from fall planting. Our own opinion is that it makes no difference, as long as the work is carefully done. The strong argument in favour of fall planting is, that farmers have then more leisure on their hands, and they can then afford to spend time in doing the work well. But, no man should undertake what he has not time for doing, whether in spring or fall, else he may find that time, labour and money have been spent in vain. We have all heard of Hodge, a type of man made famous in the cartoons of *Punch*. Hodge is not the right sort of person to be entrusted with the task of transplanting trees.

"I rams 'em in, now thick, now thin,
For what cares I if they grow or die."

No; Hodge will never do, unless master is beside him and directs every movement. Strength is by no means the best recommendation, either in taking up or setting out trees. Skill pays; so does patience. Two men are needed, and three are better. The holes should be roomy; deeper and wider than the roots require, for, with a margin of loose earth, the rootlets will speedily stretch out in search of food supplies. With a bushel or so of muck for each hole, to form a bed for the tree and a partial covering for the roots, the chances will be greatly improved. Place the roots naturally on the ground, and pack the earth firmly around the tree, at least as high as it was before removal. If the work is well done in this way, and with occasional watering, if the season is dry, the loss need not exceed one in a hundred. But, of course much depends on the condition of trees at the time they are set out. If they have been carried a long distance, and have been roughly handled, it is just possible that no kind of care can save them. In the case of a mutilated tree, it is far better to stand it aside and lose it at once.—*Rural Canadian.*

A RAFT IN THE RAPIDS.

The Kingston *Whig* says:—Probably the most miraculous escape from death by drowning ever experienced by the hardiest voyager, says the Montreal *Star*, took place Saturday morning, May 12, at Lachine. It seems the tug boat John MacDonald had towed a valuable raft of timber from Chateauguary to the head of the Lachine Rapids, with the intention of leaving it in the South Channel. However, just as the raft had neared the channel in question the current, which here takes a sharp bend, swept it around with terrible velocity towards the more dangerous and rocky South Channel, whence escape is rarely made. The strain was so great that the hawser parted and the raft was dashed down the tortuous rapids at lightning speed. The men on board, 13 in number, assembled on the front of the raft perfectly powerless to save themselves from their imminent peril. They had not proceeded far, however, before a terrible shock was felt, the raft having struck a reef and parted in two pieces. The men still escaped unhurt and managed to raise a sail with the intention of steering the raft through the rocks, which rose on every side. The wave swept over the hardy raftsmen, threatening them with destruction every moment, and finally the whole number took refuge by climbing to the top of the top of the mast. The raft struck a rock the second time, smashing it into fragments, and the men were precipitated into the water, but still held on to the mast for dear life. They had nearly reached the foot of the rapids by this time, and soon drifted out into still water. An Indian passing in a large boat, seeing their perilous position, came to their assistance and rescued them in a half drowning condition, several of the men having nearly succumbed from exposure to the icy water. The raft, which is of oak, is the property of Calvin & Son, of Garden Island and is valued at $6,000.

ARBOR DAY.

The London *Daily Telegraph* mentions with approval the custom of tree planting on "Arbor Day," favored in the United States, and recommends it to the notice of landlords in the British Isles. The growth of timber has a two-fold advantage. It is always a profitable crop, and besides, the presence of trees tends to equalize the rainfall, preventing sudden floods on the one hand and prolonged droughts on the other. With the abundance of timber still growing in Canada, we are apt to be careless on this important economic question. But the axe of the speculator is exerting its power, more perhaps in the destruction of saplings than in the removal of full grown trees. It has been urged on the Dominion Government that some encouragement should be offered to tree planting. The advantages arising from the presence of trees ought to prevent the farmer from entirely denuding his land; but the desire for quick gains frequently maks the farmer careless for the future and indifferent to difficulties that he is laying up for posterity.—*Mail.*

A Magnificent Fir.

One of the finest conifers in Germany, known as the Royal Fir, stands near the village of Albernhau, in the Erzgebirge mountains. Its diameter, forty inches above ground, is six feet ten inches, sufficient to conceal a horse and rider placed lenghtwise behind the trunk. It begins ramifying at a height of thirty-four feet, and the full elevation to top of crown measures 154 feet. It is thought to be the tallest and strongest representative of the species, not only n Germany, but in the whole of Europe. This noble tree, which is supposed to be 500 years old, now shows signs of decay, having died ont on the apex of the crown since the year 1874. The enormous dimensions of the tree may be better realized by cordwood measure. The shaft is estimated at 51⅝ cords; limbs and brushwood, 12⅞ cords, making in all 64⅝ cords.

Premier and Axeman.

In an article on the institution of "Arbor Day" on this continent, the London *Standard* says:—"It has long been an accepted tradition with Americans that no axe is worth wielding unless it has been made at Pittsburg, or at one of the many Sheffields or Birminghams scattered over the United States. Even Mr. Gladstone is said to prefer an American to an English axe, although it is on record that a Canadian lumberman, who once saw him ply the weapon at Hawarden castle, declared that our vigorous Prime Minister has still much to learn before he can preteud to possess such proficiency with the axe as is common in the backwoods of Canada."

MR. E. B. EDDY'S MILL AT HULL.

The night will be still fresh within the memories of residents of Ottawa when a few hours of fierce fire swept away almost the whole of one of the greatest industries of the vicinity, for a time threw hundreds of hands out of employment, and destroyed property valued at hundreds of thousands of dollars. The calamity for a time spread consternation in the vicinity generally, and deep as would have been public sympathy for the enterprising proprietor, Mr. Eddy, it was rendered all the more profound by the fact that he was then absent from home and in a poor state of health, which it was feared the disaster would still further impair. But where most men will sink Mr. Eddy will swim If he did not speak he acted the words of Shakespeare :

" Sick now, droop now,
How have I leisure to be sick in such a bustling time?"

The fire it will be remembered occurred in winter at a time when many building operations are impossible, but with an energy with which neither sickness, fire or frost could conquer, Mr. Eddy at once set to work to reconstruct. Such buildings as had only been partially destroyed were repaired, and every precaution used to render them as secure as possible against fire. Plans for the new mills were rapidly prepared, and in a few weeks in spite of jack frost the work of reconstruction was begun, and within six months time over the ashes of the old structure has arisen the most substantial and best appointed mill of its size on the continent of America.

The new saw mill, which stands west of the road leading into Hull, is an attractive looking, well proportioned and substantial building. Its side walls are of solid masonry, rising 32 feet from a solid rock foundation, 5 feet thick at the base and three feet thick at the top. These support a "suspended arch" roof of 120 feet span, neatly framed and well braced with iron rods, some 18 tons of rods and bolts being used in its construction. The dimensions of the building are 147x120 feet. The roof itself is of galvanized iron laid upon tongued and grooved sheeting, the latter painted on the inside with fireproof paint. It contains sixteen skylights, each of a single sheet of glass 5 ft. by 3 ft. and a half in. in thickness, which materially aid in lighting the floor below. The timbers supporting the floor and heavy machinery are of the most substantial character, framed on an entirely new principle, put together without mortice or tenon,

The machinery is all of the most modern and improved kind used in saw milling. On the main floors are four upright slabbers, two stock gangs, a circular, three edgers, three butting tables, a splitter and several stave saws. The saw logs are drawn from the ponds into the mill by three endless jack-chains. The slabber gates work upon hollow cylindrical tubes, through which cold water is forced to prevent any heating of the bearings. The two stock gangs are from the celebrated makers, Messrs, Wickes Bros., East Saginaw, Michigan, and styled "The Wilkin's Oscillating gang," acknowledge to be the best gang saw in the world, cutting from one to four logs at once, as may be devised. These gangs rest upon solid piers of cut stone masonry, 20 feet square and 12 feet high, boltod with 56 iron bolts 2½ inch iron, 18 feet long. The "circular" is from the Stearnes Manufacturing Company, of Erie, Pa., and carries a sixty inch saw with a 42-inch top saw, and will cut logs up to five feet in diameter, and 50 feet in length. Two of the edgers were also made by this firm, and have double the capacity of the old class of edgers. Ranged along the right hand wall are 13 tub and pail stave saws of various sizes. Numerous line rollers convey the lumber from the saws to the buttings tables, edgers, etc. On the lower floor is found a wilderness of belting pulleys, wheels and other machinery for the driving power. Here, too, the slabs and edgings, supplied by sluices from tho floor above, are cut into laths, pickets, shingles and various small strips. Everything possible of the raw material is utilized in this establishment, even to small pieces one-sixteenth of an inch thick. In one cornor of this room is a Silsby rotary force pump, with pipes and hose attached, and having a pumping capacity of 1,600 gallons per minute. The cutting capacity of the mill is estimated at between forty and fifty million feet in the season. To the south of the mill is a compact stone building 62x60 feet, with the roof in the same style as the main mill. This contains two segments for re-sawing deals, etc., made by Messrs. B. Fricher and Mallory, of Chicago. These are, however, not yet running. To the right a large room is partitioned off for for saw sharpening, filing, etc., fitted with five "Covill patent automatic saw sharpeners" and "Kenny's swedge," made by Wm. Hamilton, of Peterborough, Ontario. In front of these buildings is a spacious platform where the lumber is stocked and loaded on tram cars for transport to the piling ground. These two buildings, with machinery in them and the platform, are said to have cost over $100,000. On the north bank of the Government slide channel there have been erected stone buildings for blacksmith's shop and machine shop, the 40 feet by 60 feet and the latter 80 feet by 60 feet, roofed similarly to the main mill, one being used for the present as a planing mill, adjoining them to the west, the foundations are being laid of a stone storehouse, 120 feet by 60 feet, and two and a half stories high. This will be used for the storage of woodenware and factory supplies. To the west of this again will be the offices in a substantial stone building two stories high, with a mansard fireproof roof, covering an area 30 feet by 90 feet, and affording amplo accommodation for the management of Mr. Eddy's extensive establishments. A large stone factory is also in course of construction on the south side of the Government slide, which will be 185 feet by 60 feet and two stories in height. This extensive building will, when finished, be used for the purpose of packing in the upper story and as a planing mill on the lower floor.

On the old site on which before the fire the flour mill lately owned by Mr. C. B. Wright stood, but which has since been acquired by Mr. Eddy, will be erected a fire proof boiler-house, excavations for the foundations of which are now going on, from which will be supplied the necessary heat for the other buildings. It will also contain two Silsby rotary pumps with a capacity of 1,200 gallons per minute each, and from whence pipes and hydrants will he laid through all the yards and buildings.

The fire service will be as complete as it can bo made. The three Silsby rotaries will have a combined power of 40,000 gallons of water per minute, the distribution of the hydrants has been thoughtfully and judiciously made, the provision of hose is ample and placed at easily accessible points, and in addition the establishment has a fire corps of its own, composed of its most cool, active and intelligent employees, each of whom knows where his post is in case of emergency, while at the same time the residences of all the foremen are connected with the main office by telephone and electric fire alarms, so that when off duty at any hour of the night or day they can be instantly called if necessity so requires.

The electric service is also very complete. The entire yards, building and piling ground are lighted with electricity, and telephones and fire signals are in position at all important points.

To drive the machinery requires 24 water wheels, with an aggregate force of 3,000 horse power, and work is given, in the various establishments to over 1,600 hands, many families in Hull and its vicinity being employed in it, while while hundreds of other families depend on the work it gives their husbands and fathers for their support. In addition to those employed in Hull, Mr. Eddy employs several hundred men all the year around on his limits in the woods. The piling grounds are commensurate in extent with the rest of the establishment, and comprise, including the old Batson & Currier yard recently acquired by Mr. Eddy, an area of about sixty acres. A tramway conveys the lumber there from the mill, and it will be relaid with steel rails this spring. A walk through is necessary to comprehend the tremendous trade done. It was no small undertaking to build and fit up such buildings in the course of six months, especially when it is remembered that much of the work had to be done during a rigorous winter. Mr. Eddy's energy was equal to the occasion. He had able aids, too, in Mr. Mousseau his head millwright, Mr. Millen, and Mr. Blackenoy, by whom the plans were drawn, the work superintended and the machinary put in position. It must be satisfactory to these gentlemen to feel that the whole work was carried out without one casualty, and that when first put in motion the whole ponderous machinery worked without a hitch. The contractor for the stonework was Mr. R. Lester, and for the ironwork, Messrs. Butterworth & Co.

The late fire it may be remembered, destroyed the pail factory and gutted the machine shops and part of the match factory. Those were, however, rebuilt and refitted some months ago, and operations in them suspended only for a short time.

Mr. Eddy's trade in matches and wooden ware is tremendous, and extends over the Dominion from the Lower Provinces to Manitoba, where his name is a household word. The capacity of his factories for these goods is enormous, being able to supply the wants of double the present population of the country.—*Ottawa Citizen.*

THE HUSBANDRY OF FORESTS.

The grave consequences of the ruthless and wholesale destruction of our forests have recently been enforced with fresh emphasis by both nature and science, and it is high time steps were taken to repair, as far as may be, the damage that has been done. The people of Ohio, who have perhaps suffered more than the inhabitants of any other State from floods that are largely a consequence of the denudation of their forests, are making an earnest effort to guard against these destructive forces in the future. The messages of the more recent Governors of that commonwealth have bristled with warnings against the continued destruction of trees that has been going on for half a century, with exhortations to make the waste places good as far as possible. The traveller through the Ohio valley to-day would hardly believe that that fertile part of the State was a dense forest seventy years ago, but such neverthless it was. Last Friday was what is called Arbor Day in Ohio—that is, a day set apart by the Governor for tree-planting, a past-time that was generally participated in by the rural population, the children of the public schools in many of the cities having taken part in the ceremony. The State Forestry Association, which was in session in Cincinnati, also participated, thus giving practical point to their theories. Many thousands of young trees were planted in various parts of the state, from which beneficent results are anticipated as the years roll on. The present generation of tree planters may not see the fruits or enjoy the benefits of their work, but the man who makes even one tree grow where none grew before has done something for posterity and his country, and has built a living monument for himself which will long keep his memory green The idea of an Arbor Day is an excellent one, and might be adopted with advantage by other states.

Of all the natural resources which a state may possess, none are of higher or more general importance than its forests. They supply that upon which a great variety of skilled crafts may be employed. They furnish shelter which is next in urgency to the need of food. They enable us to build fleets of vessels with which to offect the world's exchanges. Unlike mines, which require a costly outlay for working, the forest yields a revenue to the wood-choppers' first day's work. Their beneficieut influence upon the climate of a country has been abundantly shown in the sad experience of lands which, like Spain, have been stripped of their growth. The forests are unlike the mines in this, that the latter cannot be worked without a near or remote approach to exhaution. With the trees of our forests the case is different. They stand as the highest type of growth in naturo. Reared as they are by the kindly nurturing influence of the sunbeam, they renew their life as constantly as tho day succeeds the night, and their period of growth is fixed according to the stated order of the seasons. The fact that they do not mature in a single seasou, that one generation must plant, another generation enjoy the abundant harvest, while the intervening generations must be content to watch with patience the slow but steady growth of some of the more valuable varieties of timber, ought to give to the general public as deep an interest in the husbandry of forests as in that of any other product of the soil.—*N. Y. Shipping List.*

AN ENGLISH VIEW.

There seems to be some movement in the spruce trade of late, though at prices which do not look to be renumerative to the shipper. We hear of sales of St. John spruce under £7 c.i.f., and it is said other lower port deals have been contracted for in the neighborhood at £6 15s. If these figures are to relied on, we do not, we must confess, understand the reason of the Liverpool brokers and agents for the spruce houses in Canada forcing the market in this fashion at the commencement of the season. There has been no doubt a quietness in the spruce trade at the outports for the past few months, hut with the advent of the husy season it does not look either a healthy or encouraging sign for spruce deals to be sold at prices indicated above. It is true, competition is severe among the representativcs of the spruce houses, and to place several thousands of standards in Liverpool, and round the coast, may be a very laudable desire on the part of the representatives to show their activity and power in disposing of their shippers' stocks, hut if the price is unrenumerative we fail to see the benefit to the shipper. This competition to sell, at even a loss, is a deplorable sign, and, if we turn to the freight market, we find it does not strengthen the sellers' position in these sales.

Ships for bringing deals from Canada are not plentiful ; the brokers do not know where the vessels are. Rates, as yet, are quoted moderate, but as the season advances and the scarcity of the wood-sailing tonnage is felt, as it is from Quehec now, sales of spruce at low figures will not bring happiness to the shippers. From Quehec to Liverpool and London 68s. has been paid for a large ship, and this will stiffen present rates from Miramichi, Bathurst, Shediac, and other North Shore ports. We have been told 65s. will be freely paid from Miramichi to-day. Perhaps it is in the mind of those who are selling spruce at under £7 to do the freighting by steamers, say 55s. This looks a very nice opertion to the mind or on paper, but steamers to load at deal ports at low rates of freights must be hard up for cargo in the United States ports, in fact cannot get cargo, before they will go to the expense and loss of time in shifting to hring home deals at such a low figure. We do not say steamers will not be got, but will they be chartered at such a rate as will leave a profit to the shipper on sales under £7 c.i.f. ? On the Continent we believe there are several large lines in spruce still to be done. Bordeaux and other Biscayan ports have to be supplied, and here again for what transactions have occurred low prices have been the order of the day. Whether the remaining buyers are going to get their requirements at the same figures is still to be seen, but the divergence between buyers and sellers seems to be about 5c. per standard.

Transactions in Spruce in Ireland have been going on quietly. The most eminent firm in the timber trade in that country, we hear, bought St. Lawrence goods early in the year at £7 10s. c.i.f., and spruce from Miramichi and St. John, we understand, has been sold at equally low prices. Low prices seem to be ruling just now. Do they presage a big stock on the other side.

DIPHTHERIA—that terrible scourage of the present day—attacks chiefly these whose vitality is low and the blood impure. The timely use of Burdock Blood Bitters forstalls the evils of impure blood, and saves doctor's hills. Sample bottles 10 cents.

MENTAL depression, headache, and nervous debility, are speedily remedied by that excellent blood-purifying tonic, Burdock Blood Bitters. The Editor of the Mitchell *Recorder* states that he was cnred of biliousness, liver derangement, and sick headache, by the use of this medicine.

THE editor of the Grand Rapids *Sachem* says :—"We are usually sparing in our enconium towards patent medicines, but observation and enquiry has satisfied us that the preparation of Messrs. T. Milburn & Co., styled 'Burdock Blood Bitters,' as a blood purifying tonic is worthy of the high reputation it has established among the people."

AMERICAN SAWS:

We represent Four of the Best American Saw Factories

VIZ.

AMERICAN SAW Co.

Emerson, Smith & Co.

R. HOE & Co.

Hubbard, Bakewell & Co.

Inserted Tooth,

BIT TOOTH,

AND

SPECIALLY

THIN

SOLID SAWS

We run 60-inch to 72-inch Solid Saws, as thin at center as 10 guage at rim—saving, over a 7 guage saw—1000 feet of lumber in every 25,000 cut.

☞SAVE YOUR TIMBER

By using THIN Saws.

McLAUGHLIN Bros., Arnprior, run two 66-in. Brooke Bit Saws, 800 revolutions per minute, on 6 to 10-inch feed.

They use Steam Feed

THE BROOKE BIT-TOOTH SAW

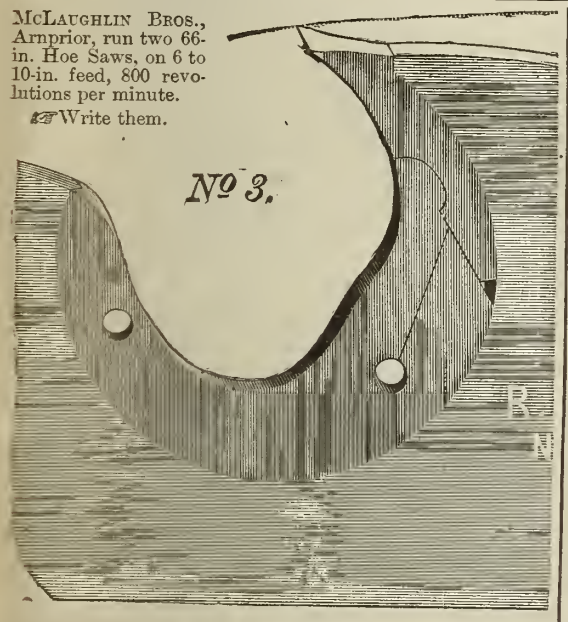
No. 1 TOOTH.

With this Saw you have either a Bit Tooth Saw or ordinary Inserted Tooth Saw, with teeth two-and-a-half inches long, both fit same socket and are interchangeable in a few minutes. These Bits require no gumming, and very little filing; are so firmly held that they will stand all necessary swaging, and can be worn down to dotted line shown in cut; they rest on lugs, saving the strain on the rim of the saw. For these reasons they will cut more and better timber at less cost than any other tooth. **EXTRA BITS (per 100) No. 1. $9; No. 2,$8.— (per 1000), No. 1, $80, No. 2, $70.**

Two sets No. 1 Bits have cut 500 m. feet pine, in 60-inch saw, running 800 revolutions per minute, on 6-inch feed. E. E. PARSONS, Arnprior.

McLAUGHLIN Bros., Arnprior, run two 66-in. Hoe Saws, on 6 to 10-in. feed, 800 revolutions per minute.

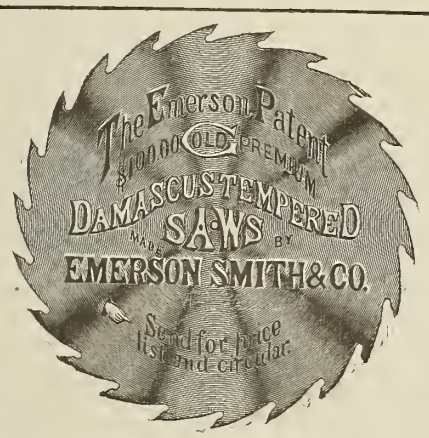
☞Write them.



HOE'S PATENT BIT SAWS.

One of the best Bit Saws made, above cut repesents usual size tooth, one size larger and smaller made. ☞Send for particulars and prices.

SAVE TIMBER GROW RICH



EMERSON'S EXTRA THIN SOLID SAWS

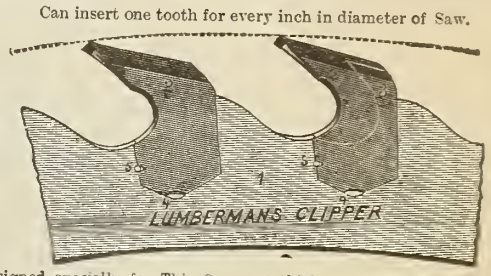
Having special facilities for the manufacture of extra thin saws for board mills, we are prepared to receive orders for Circular Saws as follows:—54 inches in diameter, as thin as 12 guage at rim and 11 at center, 54 to 56; 11 guage at rim, 10 at center, 66 to 72; 10 at rim, 9 at centre. Our unparelleled success with thin saws during past few years has induced us to recommend them to our customers. Our superior facilities are:—1st, Evenness of Temper; 2nd, Perfect Accuracy in Thickness, Saw balances perfectly; 3rd, Properly Hammered, to have equal strain in all its parts and at same time run true. This department is under the special supervision of J. E. Emerson, who has had 30 years experience and is without doubt the most successful circular saw maker in the world.

☞NO EXTRA PRICE FOR THIN SAWS.☜

EMERSON'S LUMBERMAN'S CLIPPER SAW

Can insert one tooth for every inch in diameter of Saw.

Extra Teeth 25c. each.



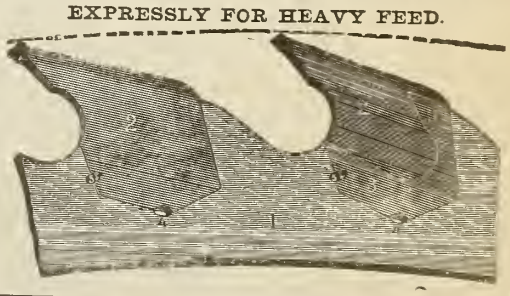
Extra Teeth 25c. each.

Designed specially for Thin Saws not thicker than 6 gauge at rim, or thinner than 15 guage at rim.

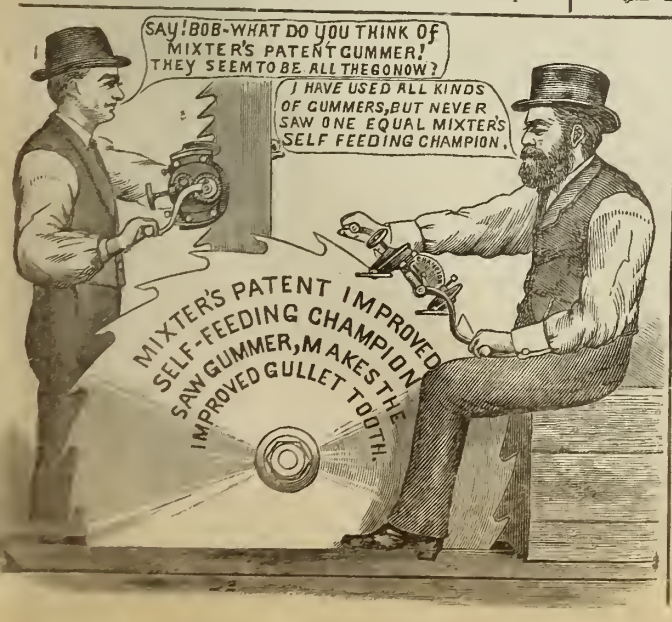
The CLIPPER FLANGE SAW

EXPRESSLY FOR HEAVY FEED.

Extra Teeth 50c. each.

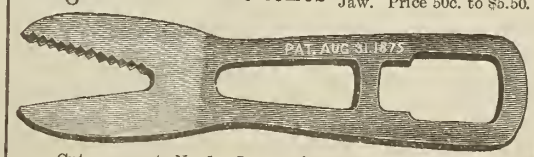


Two and a half inches long



Alligator Jaw Wrenches

5 sizes, grip from ½ to 3 inches, Iron. Solid Steel Jaw. Price 50c. to $5.50.



Cut represents No. 1. Larger sizes have Solid Handles.

WE KEEP IN STOCK ALL KINDS OF

Saw Mill Furnishings

SAW GUMMERS:—Stone's Original, large and smal size Mixter's Self-feeding Champion; Emery Wheels and Stands.

SAW SWAGES:—Hoe's, Emerson's, Mixter's, and American Saw Co.; from $1.50 to $6.00.

SIDE FILES, BELT STUDS, Detachable Belt Fastners.

JARECKI'S PATENT SCREW, PLATE, and PIPE CUTTER, ½ inch to 2 inches, $28.00; smaller ranges in proportion

Band Saws, Scroll Saws, Rainbow Saws for felling trees, American Shingle Saws, Lace Cutters. Cant Hooks. Flue Scrapers, Leather, Cotton and Rubber Belting.

SPECIAL AGENTS FOR GANDY'S PATENT MILL BELT, runs wet or dry; the best and cheapest main driver.

WORTHINGTON and BLAKE'S PATENT STEAM PUMPS. ECONOMIST PLANER and MATCHER COMBINED, large range of work, light, handy, durable, cheap.

Ewart's Detachable Chain For Log Jacks, Refuse Carriers, Sawdust Carriers, all sizes, Live Rolls, Tranfers, Slow Speed Driving Belts, Tie Loaders, Slash Tables, Trimmers, Lumber Sorters, Shingle Block Elevators, and many uses about a saw mill.

HIGH CLASS HEAVY and PORTABLE SAW MILL MACHINERY our Specialty.

Waterous Engine Works Co., Brantford

Send for New Price List and Chain Circular. ☞Mention this Paper.

WOOD PAVEMENT.

THE new wood pavement in the Champs Elysees, which extended only half the length of the avenue, has stood the test of an entire winter, and so it is to be laid to the Arc de Triomphe. This pavement has been put down by an English company. The process of putting it down is as follows :—The ground is first excavated about a foot in depth. A layer of stones about the size of walnuts, and mixed with cement, is then laid down. On this a second coat of cement, about an inch in thickness, is carefully spread. The blocks, which are previously prepared by being saturated with some resinous compound into which tar enters largely, are set upon this cement ; they are six inches thick by a foot in length and three and a-half inches in breadth. A space is left between each block, and after they are laid a thick preparation of tar is poured over them, followed by an application of fine gravel. Finally, the interstices are filled with cement.

AMERICAN FORESTRY.

We take the following from the official report of Mr. W. Brown, Professor of Agriculture, Farm Manager, and Experimental Superintendent of the Ontario Agricultural College :—

Two words meaning much—how much no one at present alive will ever realize, and this is what strikes at the root of man's indifference on the subject, that is, that he cannot himself personally hope to receive all the benefits from the conservation of the present trees, and particularly from replanting. American returns must be smart, strong and undoubted ; the idea of permanency in the long after years does not concern us so much as *now* ; we are fond enough of speculating upon cause and effect, and, in this matter, delight in big talk, that indeed does not lack for as much soundness as Europe can produce, but it is talk largely only. Let us add to this phase of our life by submitting some thoughts on such an important subject, with the hope that we are not far off from acting up to what is preached.

THE GENERAL IMPORTANCE OF FORESTRY IN NORTH AMERICA.

It is the experience of the world that more difficulty, in all its forms, is found in reclothing with trees where trees grew before, than it is to plant—not replant—a country for the first time. There is not only the practical fact of succession of cropping in its scientific and natural bearings as similiarly realized, for example, in the products of the farm, but the more serious one of the indifference of its population. It is just a piece of human nature everywhere, that what has been felt as common and everybody's property, is no one's particular business when remedies are asked for in the exigencies of public affairs.

By forestry is meant the whole science and practice of arboriculture ; the conserving, the care-taking, preservation and proper management of existing trees, and the replanting of land for purposes now to be discussed. Speaking generally we are, and we are not deeply concerned, as a nation, in the more modern views of forestry. In Europe it takes a shape that may never be realized here, because of one thing—that one thing is large proprictory, the possessing within *one man's* power all the area and class of soil suitable to profitable production on a large scale, so that even that one man can employ officers and men in such numbers as make profits certain. Cultivated America meantime is so subdivided as to effectually preclude all idea of sufficient massing of woods to receive equal results with Europe—but the day may come. Though not thus situated for forest culture, we are otherwise obliged to give it a place in our rural economy. It is especially applicable to any country that has been a forest by nature, where in some things nature has been unthinkingly trampled upon, and where agricultural progress now demands the aid of her sister science—arboriculture. We are not singular in these matters, and can sympathise with

WHAT IS BEING DONE IN THE CONSERVATION AND REPLANTING OF FORESTS IN OTHER COUNTRIES.

There is no country whatever that has made its agricultural history and does not now complain of want of trees. India, Australia, Europe and the United States, all tell their story of overclearance, of the need of conserving, and of the necessity of replanting. Their greater years than ours has given experience that should encourage, and dismiss all doubts on our part. The effects of judicious re-clothing are already subjects of congratulation, and of yearly revenue in competition with agricultural so much so indeed with some that the other is not uncommon talk with proprietors. India has her standing army of foresters, trained to all cunning in sylvan matters, at European schools ; Australia can already boast of its "Forest Board,"—its conservator of forests, tree nurseries, extensive enclosures planted and to be planted, and a whole system of arboriculture of the most encouraging kind, and the United States, though doing more talk than spade work, are unquestionably on the very margin of a revolution, they have not gone through the forest without "seeing some firewood."

THE OBJECTS OF CONSERVING AND REPLANTING ARE NOT A FEW.

Most people think of trees, first of all, as means of shelter—under several forms. We like shelter for buildings, shade for ourselves, shelter and shade for animals in the field, and shelter for farm crops. These alone would make up a large value in any district where required, and would justify all the cost and subsequent attendance. Yet, we have another aspect of the question that takes an equally strong place in our regard : *Climate* is not alone a matter of great outside causes, but one intimately related to local influences, among which trees are preeminent. We have no time to show how temperature, rain-fall, moisture, and evaporation are directly influenced by a small or large surface of trees—how therefore water in every form is in the hands of trees for local distribution. This second duty of forestry as a science and practice would even seem to swallow up the previous question, and are consequently inducements alone to its prosecution on our part. Were neither of these sufficient, however, to convince, the third great reason for tree cultivation will surely convert even the most stiff-necked among us. It is no matter of doubt, under average conditions, in any country, that tree culture is more profitable as a crop than its own agriculture, year by year, This position is not open to question, but clear and marked in all experience where age has given time for proof. And lastly, some men are satisfied when large expenditure secures what to them is all in all ornament ; and assuredly ornament is value. Who would not give $500 more for a farm where the buildings are set off by just the kind, number and proper position of trees and tree clumps ?

THE AREA OF LAND IN NORTH AMERICA

is not an unknown thing. There is no case in Europe as regards *small proprietory*, having recently occupied a forest country, and where extensive clearings took place for agricultural development. But it is not true that the American continent is now poorly wooded in comparison with other countries ; the United States can show twenty-five, and Canada fifty per cent. of the cultivated districts, as still under trees. This is possibly larger than any other continent, if we except the northern part of Europe, where agriculture is necessarily at a discount, and where forest is practically untouched. What then is the cause of our discontent ? if on an average, one-third of populated North America is still under forest, why do we advocate conserving and re-planting ? or, in other words, what are

THE REQUISITE PROPORTIONS OF TREE SURFACE TO THAT UNDER AGRICULTURAL CROPS ?

This is just one of the things that we do not know, and that we are not likely ever to know as a point for general practical guidance. The conditions affecting climate are so various as affected by latitude, altitude, aspect, soil, sea or lake neighborhood, and vegetation, that no possible number of observations, in any length of time, could say how much for one district is so much for another. However, men do come to realize through science and practice—practice especially—that a farm, or a district, needs the protection in certain places, and thus by such a simple guidance alone, a country could easily be reclothed to the extent required, at least for shelter, if not for regulation of climate, or of sufficient area as a cropping investment ; this point of immediate shelter is, therefore, within everybody's knowledge, and needs no scientific recognition, and should not require any governmental spurring. But the greater field of climate, as an unknown one practically in this relation, is more a national problem, and still very much a scientific enquiry, and what it will have to say in regard to the proportion of trees to farm crops no one can tell. Of course, if we disregard everything but the direct profits from trees as a crop upon land, then we shall likely override all other deductions, and possibly bring back the days of laziness and unhealth. Viewing trees in all their relations, I am of the opinion that upon an average of conditions in Ontario—one-fourth of the land should be under trees, as this is just double what we have at present, there rests the apparent inconsistency of wanting to conserve and replant, all the while that we have double what is needed. This brings out the fact that it is the *irregular distribution* of tree surface in our case which gives trouble, that some parts have more than required, and others have been over-cleared. So then

THE EXISTING CONDITION OF OUR FORESTS

is the very first consideration in this enquiry. What is the condition of all our woodlands, both in the older and newer townships at the present moment, and what should be done with them in order to their best maintenance—such a maintenance as shall secure annual revenue, shelter, and climatic amelioration along with the due agricultural development ?

Outside the lumbering interests there is no enclosing, preserving, caretaking, or conserving in any sense, except the right of individual ownership, some of whom do act the forester, but nationally there is nothing recognized, and hence waste. The average bush of North America is a beautiful sight and yet a sad one. The artist must revel in its variety of form, and foliage, but the fighting for place, the scraggy monarch of three hundred years, smothering even as he dies, scores of plants that but for him would attain to value ; the general want of light and air, and otherwise a decay and loss, recognized only by those who are scientifically and practically foresters. I do not mean that our forests in every case should be managed similiarly to those in Europe, because much of our best timber requires very different conditions, but similar principles ought to guide our management. While then, we owe a steady eye to progressive judicious replanting, it is above all others our first duty to manage well what we do possess. It will be the cheapest, the most rapid, and the most sure method of readjusting matters—along, no doubt with a certain replanting of cleared land. No fear need exist in regard to

THE ADAPTABILITY OF SOILS AND CLIMATE TO RAPID RESULTS,

for nature herself has already shown us what to do both in repeating the same kind of crops, and in the proper rotation of trees, by sections of the country. But that nature has been the best guide in most things is not admitted. We cannot follow her in mode of thinning out so many annually, in making branchless stems, and therefore leafless and shelterless trees, comparatively. It is sound in practice, though not in theory, that ten trees, of certain kinds, standing within a given area, will afford less shelter, less wind break, than three trees of exactly the same sort, properly managed on the like area. We have soils and climates wherewith to do almost anything in tree life—from the pine of the north, which luxuriates in apparently bare rock cleft, to the walnut of the south, that must send its carroty root several feet into a rich soil. European forest revenue begins, as an average, fifteen years after planting ; that of America ten years afterwards.

As the subject grows upon our attention, we are next concerned with

WHAT PARTS OF THE COUNTRY SHOULD BE CONSERVED OR REPLANTED.

And in this part of the study it is obvious that our views cannot be confined to single farms, or even special sections. Referring, as we must, to the great over ruling influences, as previously indicated, we have to deal with geographical features that may embrace thousands of acres that have to be subserved by one, or more, massing of trees. Just where to conserve or replant, how much on the spot, or spots, in what particular form—belt, clump, or block—and with what kinds of trees, so as to gather and dispense all the virtues that trees are known to possess, is the great problem of the future. To say that we should replant only our less valuable soils is nonsense, though sensible enough from the cultivated standpoint ; that high lands should be conserved or reclad as against lower parts is largely true, though not generally applicable, and that conserving and replanting must go hand in hand, and take place anywhere as found necessary through experience, is correct in every sense.

Following this view of the subject there is naturally that of

SUITABILITY OF CERTAIN KINDS AND FORMS OF TREES FOR SPECIAL PURPOSES,

whether for neighborhood of dwelling, roadside shade, shelter-belts, field clumps, or for more extensive planting, efficiency and permanency in every example are the primary considerations. It is not difficult, because experience is extensive, to decide on those species of trees for roadside, and house shelter, but much has not been done for the others, and so some advice will not be out of place.

To attain all the objects desired in replanting it is obvious that many varieties together in one clump or plantation would be indispensible ; early shelter and rapid returns for the money invested would be best secured by certain kinds of trees more than others ; such trees would also serve as nurses to others, and permanency in their case would not be wanted, but we would desire in their character a full and spreading foliage coming early and remaining late in the season, or even throughout the winter, to attain size in ten or fifteen years, and to be of a quality that would fetch a handsome revenue per acre for the period since planting. The removal of these gradually from the plantation as required by the progress of the other sorts would form, as it does now in other countries, a nice scientific and practical study. The second class of trees in such a plantation should be of a less spreading habit and more of upright growth so as not to interfere too early with the first and third classes ; they should also begin to offer some revenue at thirty years, because the most of them would have to give place to the third or standard class, in about fifty years from the date of planting. In all well regulated planting one set of trees is held as those to remain as long as good management, their own natural habits, and a proper time to harvest without loss, will allow. These are the third class referred to, and necessarily we desire a slower growth, a habit that will not spoil by close neighborhood—a sociable plant therefore, giving high value when cut, maturing late, holding its maturity long, giving low branches and many leaves, a gatherer and holder of atmospheric moisture, a wind sifter, and holding electric communication with cloud and other trees at a distance. We have such trees of several varieties.

The preparation of the land, detailed method of planting, distance apart of trees, including fencing, drainage, knowledge of enemies and friends in nature, and all the management throughout in order to attain the highest results are too much for my time on this occasion.

The farmer's view of a wood, is grazing. Modern arboriculture does not recommend it in Europe at any stage of growth, yet, with us in the more difficult maintenance of permanent pasture, I see no objection to the admission of sheep during the second, and cattle during the late cropping periods.

The duty of legislatures, in regard to existing woodlands, and replanting, is being pressed upon our attention from various quarters, and unquestionably ere long every progressive country must take some action. How much to do, and what not to interfere with, will make the bill. That the Ontario Government has a warm side to trees is well known, and it is to be hoped that whatever they do it will be early, full, good, rapid and permanent.

American Forestry will have no place in all its scientific and practical value until one of two things be accomplished : one is the conviction on the part of our farmers, of the necessity of conserving and replanting, therefore their

education up to these, and the other is the power by Government to resume parts of the country for conserving and replanting. Both will be difficult; the former would be the slower, but eventually the most thorough because of self-interest; the latter would be more immediate and possibly less efficient, practically, though scientifically better applied. No large number of various interests could be so well arranged as by a company, and therefore Government will have to become foresters in all the many details of the profession. Were a properly conducted system of forestry began in 1884, the results would be so strong in the year 1900 as to astonish. It would possibly change much of our present agriculture practice, it would certainly enhance the production of winter wheat to an immense extent; it would enable us to graze nearly two for one by checking rapid evaporation and encouraging permanent pasture; it would largely nullify droughts, perpetuate streams, and generally make climate more regular and reliable.

To those acquainted with Arboriculture as a profession in all its national bearings, an annual expenditure of $50,000 has in other countries made an *annual* crop revenue of $25,000 within fifteen years, in addition to the *triple* value of climatic amelioration.

THE BOATMEN'S STRIKE.

The Ottawa correspondent of the *Mail* of May 15th says:—The American boatmen who made an organized demand a few days ago for an increase in shipping rates between this port and New York evince a strong determination to secure what they demand. There are 43 boats now lying at Perley & Pattee's wharf, near Blyth's point, awaiting the result of the lock-out. On Saturday at a meeting of boatmen, the following captains were appointed to confer with the shippers:—Messrs Dan. Donoghue, W. Lily, D. Peachy and Jules Fulton. This morning they received an offer of $3.75 per thousand feet, an increase of twenty-five cents over last season. This offer was refused, the boatmen holding out for $4 per thousand. It is said that the boatmen can under no circumstances make two ends meet by the old rates. Their expenses are greater this season, and at the rate demanded they can barely keep things going. There are over twenty boats at Montreal at present awaiting word from Ottawa to come up for loads. If the increase is not granted they will not come. There are over 600 boats in the recently formed organization, and the strikers here have received every encouragement to hold out. There has been no tow of boats from Ottawa as yet for the States this season. It is a question whether lumber shippers will concede the demand. The bulk of the lumber to be shipped this season was purchased last year, and the freight rates then existing were taken as a basis of their calculation. The buyers are consequently very materially affected by the demand for an increase, which amounts to a large sum when the enormous quantity to be shipped is considered. They were willing, however, to meet the boatmen half way, and increase the rates 25 cents per thousand.

LATER.—The demands of the striking American boatmen have been acceded to, and they commenced loading on Tuesday, May 15th. The rate received will be $4 per thousand feet.

RAFTING IN QUEBEC.

A recent number of the Montreal *Witness* says:—The direction of the wind throughout last night and to day has been very favourable to the floating of timber rafts down the river, the result being that large numbers have gone past the city *en route* for Quebec within the last twelve hours or so. About noon to-day a fleet of ten very long rafts with all sails set passed down, the high wind at the time, coupled with the strong arms of the oarsmen, propelling them at a prodigious speed. When opposite the harbour they cheered vociferously and waved their flags, which salute was returned by the sailors of several ships. During the next few days the quantity of timber sent down will doubtless be large.

A raft of some sixty cribs of timber and having between fifty and sixty men on board, was descending the Lachine Rapids this afternoon, when it struck upon a rock about the middle of the current. Half the raft was shattered to pieces and separated; the timber went down the stream. Strange to say none of the men were lost.

YOUNGS' POINT.

From Our Own Correspondent.

THE FIRST DRIVE.—The first saw log drive this season passed through here last week *en route* to the mills of Mr. Fowlds at Hastings; John Newall is foreman. They were very fine logs and numbered 6,000. They came down Jack's Creek, being cut in the Township of Methuen.

SAW LOG DRIVES.—Mr. Geo. Chalmers' two drives are getting on well so far. P. Cassidy's drive out of the Township of Methuen has got out as far as Boschink Narrows, and A. Wynn's drive got out of Eel's Lake into Eel's Creek last week.

THE SAW MILLS.—Mr. P. Young, jr., has now commenced work in earnest for the season with a good gang of men to cut ties, lumber, etc. All kinds of lumber can be purchased at the mills here for buildings and other purposes.

Timber Cutting Permits.

OTTAWA, May 16.—A return brought down to-day relating to the grant of permission to cut timber or to mine on lands within the territory now in dispute with Ontario shows that from August, 1878, to March 15, 1883, there were thirty-five permits to cut timber granted. The total amount of dues received by the Government in this period was $21,690, of which $16,416 was from the Canadian Pacific Railway from its permit to cut timber for twenty miles on each side of the railway eastward from Brokenhead river. No permits or leases for mining have been issued. The permit of the Canada Pacific Railway Company was on October 21, 1882, renewed until November 1, 1883. The other permits were for limited quantities.

Saw Mill Burned at Chatham, N. B.

CHATHAM, N. B., May 12.—The water mill opposite Chatham was burned this morning at five o'clock. It was owned by Guy Bevan & Co. and Wm. Richards. About a million and a half of deals on the wharf were saved. The mill was the oldest on the Miramichi, and had been running about three weeks this season. The origin of the fire is unknown. Bevans and Richards paid, it is said, $24,000 for the property. The mill was insured for $5,000 in the Queen, $5,000 in the Royal, and $2,000 in the Canadian. There may be insurance in England also.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

A WONDERFUL CHANGE.—Rev. W. E. Gifford, while pastor of M. E. Church, Bothwell, suffered from chronic dyspepsia so badly as to render his life almost a burden. Three bottles of Burdock Blood Bitters cured him.

BAXTER'S MANDRAKE BITTERS

THE ONLY VEGETABLE CURE FOR

DYSPEPSIA,

Loss of Appetite,
Indigestion, Sour Stomach,
Habitual Costiveness,
Sick Headache and Biliousness.

Price, 25. per bottle. Sold by all Druggists.

Short of Logs.

THE mill of Williams Bros., at Saginaw, shut down last week for want of logs and it will be found before the sawing season closes many others will be compelled to similar action; and the mill alluded to is not the only one thus far which has done so. In the face of such facts, and that log running is impossible in some of the tributary streams, those papers which are predicting that there will be plenty of logs to supply the demands of the Saginaw River mills, and that the cut of the river will equal that of last year, while commencing about five weeks later than in 1882, are exhibiting a great lack of appreciation of the situation, and a total disregard of any foundation for such an assertion. With the Tittabawassee 300,000.000 feet short of the usual amount of logs left over in the boom limits and water already at a low stage, the utter improbability of a full supply of logs is too apparent for discussion.—*Lumberman's Gazette.*

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:
JAMES EPPS & Co., Homœopathic Chemists,
18Lly London, England.

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address
ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

THE KEY TO HEALTH.
BURDOCK BLOOD BITTERS
Unlocks all the clogged avenues of the Bowels, Kidneys and Liver, carrying off gradually without weakening the system, all the impurities and foul humors of the secretions; at the same time Correcting Acidity of the Stomach, curing Biliousness, Dyspepsia, Headaches, Dizziness, Heartburn, Constipation, Dryness of the Skin, Dropsy, Dimness of Vision, Jaundice, Salt Rheum, Erysipelas, Scrofula, Fluttering of the Heart, Nervousness and General Debility; all these and many other similar Complaints yield to the happy influence of BURDOCK BLOOD BITTERS.
Sample Bottles 10c; Regular size $1.
For sale by all dealers.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. JUNE 1, 1883.

A BLACK walnut tree of average size reduced to gun stocks is worth from $1,000 to $1,500.

THE Belleville *Intelligencer* says that a force of men is now rafting timber at the G. J. R. dock for Mr. Boyd, of Bobcaygeon. The raft will consist of two drams, which contain about 60,000 feet, and will be shipped for Quebec at the close of the week.

THE Newmarket *Era* says that another machine has been added to the large and increasing manufactory of Messrs. W. Cane & Son, in the shape of a double bolter, by the aid of which two shingles can be cut at once, thus doubling the capacity.

THE drivers in the Michigan streams are favored with water to a much greater extent than are their co-laborers in Minnesota and Wisconsin. In the two last named states there are a great many drives hung up, and further progress will largely depend upon spring rains.

WE have received from Mr. C. H. Clark, of Barrie, some beautiful specimens of Spurr's Papered Veneers, to take the place of ordinary paperhanging while giving the effect of woodwork for either walls or ceilings. These veneers seem admirably adapted for the purpose; they are no thicker, including both wood and paper, than the common hangings, while the grain of the great variety of wood is beautifully displayed. We cannot speak personally as to their durability, but there is very strong testimony in their favor.

THE Bay City *Lumberman's Gazette* says :—At some of the large lumber distributing centres, the newspapers are coming to a realization of the true situation of affairs at the initial points, and are giving the signals for a stiffening of values, in order to meet the inevitable with some show of complacency. They are evidently beginning to appreciate the facts stated several weeks ago by us that the exorbitant and almost unrivalled call for lumber to meet the demands of building operations must necessarily stiffen values, as well as brace up the spinal columns of the manufacturers.

THE best authorities in Arizona estimate that the territorial plateau, which embraces six thousand square miles, will yield 20,000,000 feet of lumber. The timber is said to be of the finest quality, and if protected by the Government will be source of great wealth to the Territory.

A cablegram has been received from Paris announcing that Mr. L. A. Senecal had made another grand *coup* there by the sale of the Hall estate, comprising timber limits, mills, and millions of acres of land, to the new French Colonization Company, which he had so much trouble in getting chartered at the last session of the local Legislature.

THE different saw mills along the Pacific coast of British Columbia are running night and day to supply the demand for lumber for the erection of new canneries and buildings. On account of so much work going on along the coast, the Indians are looking forward toward obtaining high wages during the fishing season, and are very scarce already.

THE *Lumberman's Gazette* says :—The Wisconsin drives are in about the same condition as those of Michigan. Unless there should come heavy rains, many of the logs will be hung up. The Chippewa *Herald* of a recent date says that of the 700,000,000 feet put in only 200,000,000 had been got out, and that it would take a week's heavy rain to insure the drive. As the rain has not made its appearance, the prospects on the Chippewa must not be very flattering.

THE Grand Forks *Herald* says :—The lumbering outlook in northern Minnesota is not bright. According to the Brainerd *Dispatch*, which is in a position to know, about every drive in northern Minnesota is hung up high and dry, except those on the Rum river and they are moving very slowly. If it don't rain pretty soon and swell the waters on the various small streams on which the logs are lying still, lumber is going to be lumber this season and don't forget that for a moment.

THE Amsterdam, N. Y., *Recorder*, says that by the law which has passed the legislature, prohibiting the sale of State lands containing forests, the lumber trade in the Adirondack woods, of which Gloversville is the shipping point, will almost cease in two or three years, and will ultimately throw out of employment a large number of men. The bill was passed in order to protect the water supply of the Hudson and Mohawk Rivers, it having been asserted that if the wholesale destruction of the northern timber lands continued for a few years longer, navigation on the Hudson would only be possible as far north as the city of Hudson.

THE Belleville *Intelligencer* of May 22, says : A party of river drivers arrived here this morning and will leave for their homes at Sorel, Quebec, to-night. They have been in the woods seven months. Reports from the Beaver Creek drive are very encouraging, as excellent progress is being made. It is expected the drive will reach Trenton at an earlier date than any that has yet passed through Beaver Creek. The head of the first drive on the Moira is in the dead water on this side of O'Brien's bridge, and the tail passed Tweed yesterday. The wind aided the rivermen in there work there to-day, and it is probable that the logs will begin to arrive here on Thursday.

A TRESTLE-WORK being constructed for a railroad across Lake Pontchartrain, Louisiana, is to be twenty-one and a half miles in length. The distance comprises thirteen and a half miles from People's Avenue Canal to the Point, five and three quarter miles across the lake, and two and four-tenth miles from the north shore. All of the piling along the southern shore, with the exception of about one mile, has been driven, and this division will be completed by July 1. Of the piling in the lake two and a quarter miles have been driven, and one mile of the work is completed. The trestle on the north shore has been finished some time, and the rails are laid nine miles. The piles average sixty feet long, and are driven about forty feet.

GRAVENHURST.

From Our Own Correspondent.

MAY 22.—The season has fairly opened here, and the saw mills, with the exception of one, have commenced operations. The spring has been a very backward one; the ice remaining in the lakes as late as 16th inst. This has helped to retard driving, as after getting the logs down to some of the smaller lakes the lumbermen were unable to get them any further until the ice went off. River driving is now well advanced however, the continued rains and cool weather being very favorable to this important operation, an operation which has come to be a very expensive one in this region of late years, owing to the long distance the logs have to be driven, the smallness and crookedness of the streams, the beds of which are also much obstructed by rocks, so that unless the season proves extremely favorable there are always a large quantity of logs hung up. During the past winter very heavy stocks have been taken out, probably the heaviest in the history of Muskoka, and should they be all got down to the mills the present season bids fair to surpass any previous season in the manufacture of lumber to the extent of about ten million feet. There are now eleven saw mills in and around Gravenhurst, the estimated cut for this season being 40,000,000 feet of lumber and 60,000,000 shingles. There are also several small mills up the lakes cutting three or four million feet of lumber which will be shipped from this point.

A large portion of last season's cut still remains at the mills, this is, however, all in the hands of the dealers who are shipping it as fast as they can procure cars from the railway company. Lumbermen say that their stocks will cost them this year at least one dollar per M. more than last year owning to the severity of the winter, and the high rate of wages, and very few stocks have been sold yet, as the dealers seem indisposed to offer higher prices than were given last year.

Several of the mills have put in new and improved machinery this spring, thereby adding considerably to their capacity.

The Woodstock Lumber company have sold their mill and limits to Messrs. Van Leek & Co., of Port Burwell, for $90,000, who have taken possession and intend running the mill to its full capacity.

There are also one or two new mills projected here, of which I will give you particulars in a future letter.

WINNIPEG.

From Our Own Correspondent.

MAY, 23.—There is a marked change in the lumber trade of this place as compared with last season. We were then importing four-fifths of the required stock, principally from St. Paul. Our three good mills were not then constructed; all three were started last fall and run between one and two months. This spring they are again running, with the exception of the Winnipeg Lumbering Company's Mill, which is having a new engine and boiler placed in.

Their cutting capabilities are nearly equal to the present demand of the town, which, though still large, is immensely less than the exceptional requirements of last season. As the building season advances more will be required. There is also a rapidly increasing demand along the line of the C. P. R. Southern Manitoba too is a fine growing market. It is quite evident, however, that the home supply will at least be nearly equal to the home demand. The spruce lumber and timber from Lake Winnipeg contributes its small but important share. The main dependence, however, will be on the mills in the Keewatin district, several new ones of large cutting capacity have lately been built, and one or two others are in progress of construction. There are also small mills to the westward along the line of settlement where ever there are patches of forest large enough to warrant their building, so that the North-West can in a great measure rely upon its own resources for its timber and lumber; its success would be fully assured if it could carry the same self dependence into its many other industrial departments, but time and patience, with North-West energy, will accomplish much.

Mill-men here have shared in a very prevalent impression, that if you want anything good you must go to the States for it. Accordingly the Winnipeg and Rainy Lake Lumber Companies each went to their chosen American manufacturers for their engines and mill machinery. D. E. Sprague, Esq., however, had faith in Canadian mechanics, the design, construction and management of the mill being wholly Canadian. Mr. Wm. Hamilton, of the good town of Peterborough, supplying the machinery and motive power. The result vindicates the good judgment of the proprietor. While we would offer no disparagement to the other mills which are certainly excellent, yet it is generally conceded that Mr. Sprague has the neatest, best arranged, and finest working mill of the three. As a lumber manufacturing investment it stands No. 1.

It is also gratifying to find that the impression referred to is being corrected in more instances than this.

NORTH-WEST TIMBER.

The timber supplies of the Canadian North-west are beginning to attract the attention of American lumber manufacturers, and it is not at all unlikely that considerable capital from the south side of the boundary line will be employed within a few years in developing the resources of this country. Americans have opened their eyes to the fact that with railway and water communication between the North-west and the Ontario lumber districts, they must soon lose the extensive market they have hitherto had in Manitoba. Had they only the reduced freights, and quicker transportation furnished by the opening of the Thunder Bay route to compete with there would be little fear but they would still manage to maintain a footing in this market. But when a tariff is taken into consideration the case is entirely altered, and the supplying of Manitoba and the North-west will soon be beyond even the elastic power of the American manufacturers' price doctoring. It would be altogether out of the limit of American trade ingenuity to suppose that these manufacturers would quietly yield up their privileges in such a valuable and increasing trade field, without exhausting every plan for continuing competition. Logs are admitted duty free in the Dominion, but to float them down the Red River into Canadian territory, and for Canadian mills to saw, savors too much of dealing in raw material to suit the ideas of the enterprising class who are connected with the lumber industry in the North-western States. As a natural consequence American lumbermen are casting their eyes towards the timber fields of the North-west, with a share of which as resources in raw material they can take their place among the manufacturers of this country.

It is a fact that the timber of this country, or at least that portion of it fit for lumber manufacture, has as yet been very little drawn upon. Hitherto lumbering has been little more than a system of culling from the best districts within easy reach of Winnipeg. The lower portions of Lake Winnipeg were until very lately the only locality where operations were carried on to any extent, and these have only recently been supplemented by cutting in the Lake of the Woods country. As yet the vast timber fields on the upper Lake Winnipeg, where the finest spruce limits in the Northwest are known to exist are almost untouched, although the establishing of a more extensive system of navigation on that lake is all that is necessary to bring these timber lands within easy reach of the Manitoba lumber market. It can scarcely be expected, with the present system of rapid development, and ever increasing demand for lumber which is now going on in the Northwest, these timber resources will long remain untouched, and it is just possible that American capital and American enterprise will soon assist much in their development.

A few days ago Mr. Platt B. Walker, editor and publisher of the Mississippi Valley *Lumberman*, was in Winnipeg accompanied by his brother of the well-known Minneapolis lumber firm of Camp & Walker, with a view of inquiring into the timber resources of this country. This visit was only a preliminary one we understand, and as soon as lake navigation opens he intends to return and arrange for a system of lumber prospecting on a large scale. No man

is better able to form a correct idea of the lumber resources of a country, and before the close of the present season he will no doubt be in a position, to furnish reliable information regarding those of the Northwest. Numbers of Americans besides Mr. Walker have contemplated such an undertaking, and it is not at all unlikely, that during the summer months quite a few lumber exploring parties from the United States will be at work on lake Winnipeg and other timber districts. Should these explorations result in the discovery of valuable lumber fields, they will soon be brought under the influence of the lumberman's axe, and prove a source of great profit to those who engage in their development. It would be rather a takedown to Canadian capitalists looking for Northwestern investments, if these enterprising Americans should open up fields, that would give rich returns, and greatly extend a valuable industry in the country, while they—the Canadians—were bothering with paper-town sites, worthless charters for imaginary railroads and such like; and there is a strong probability that such will be the case. Practical manufacturing enterprise cannot but produce satisfactory results, especially when prosecuted in such a promising field as the timber resources of the Canadian Northwest.—*Winnipeg Commercial.*

HARDWOOD UTILIZED.

Mr. John Shetterly, a manufacturer of hardwood lumber, at New Troy, Mich., tells the *Northwestern Lumberman* that he saws beech and elm principally, and has placed something over 1,000,000 feet of beech with consumers in Chicago. The beech of his section is chiefly the red variety, the white being more hard and warpy, and worth about two dollars per thousand less in the market. Beech is becoming a more important factor in the hardwood trade, on account of its cheapness. It is a very durable wood, and has a fine grain. It is principally used in the making of school furniture, chairs, bedsteads, etc., and when quarter-sawed is considerably used for finishing. To some extent it has been employed in floors, and by many it is thought to be equal to maple for that purpose. The furniture makers are using much more beech now than was the case a few years ago. The red kind is a very handsome wood, and can be made to imitate cherry. The trees in the region of New Troy afford on an average about 40 to 50 feet in length of logs. Red beech is worth $15, log run, and firsts and seconds sell for upwards of $17. Beech stumpage is worth from $1 to $1.50. Elm commands somewhat better prices. Mr. Shetterly aims to obtain all the good lumber possible from a log, and to make clear clear, and culls culls. The frequent turning of a log, though requiring time, he holds essential to the securing of the largest amount of good lumber. In another respect his example is worthy of emulation by others of his craft. He ships his good lumber to market, and keeps the culls at home, realizing the fact that there is a good demand for a decent article, and that the market is overstocked with poor lumber.

CHICAGO BLOCKADED.

The *Northwestern Lumberman* of May 19th says:—From Thursday to Saturday last, inclusive, a serious and damaging blockade existed at the mouth of the harbor. The Wocoken, a huge steamer, became unmanageable, owing to the very rapid current which the high water in the river had produced, and though in charge of two tugs, it nevertheless swung across the stream at the north pier. So tightly was it wedged in, that it could not be stirred, though everything possible was done, and a fleet of tugs was engaged. Neither steam nor strategy had any effect. Vessels were arriving constantly, but were unable to proceed up the river. It was thought that the Wocoken would have to be lightered before she could be got off, but by diligent effort during Friday forenoon she was pulled out of the mud, and the blockade was open. The jubilancy of the vesselmen was of short duration, however. In about a half hour the Tacoma, another huge steamer, grain-laden, repeated the exploit, and was soon jammed fast across the river, with her nose thrust into the Illinois Central slip, and her stern resting firmly against the dock of the Peshtigo Company. The united efforts of a half dozen tugs failed to budge her. She was even more firmly fixed than the Wocoken had been. The puffing and tugging continued all the afternoon, and till Saturday afternoon, with no success. About a dozen tugs and steamers were at work, and the vicinity was overspread with a dense cloud of smoke, which settled pown on the scene like a black fog, the smutty blasts blowing into the faces of the perspiring workmen and the streams of curious spectators who thronged the slips for three days. The masts and smokestacks of some 90 craft towered in the air like the skeleton trunks of a wierd forest. One half of the vessels were loaded with lumber and posts, the latter cargoes being strikingly numerous. Since it would be necessary to send to Milwaukee for a floating transfer elevator to lighter the Tacoma, if this expediency was resorted to, a diligent endeavor was made to bring her out. At one time nearly a score of propellers and tugs were at work, with no success. Purchases were rigged, and finally, along in the evening, a happy combination was hit upon, a four-fold purchase slowly starting the Tacoma from her stubbornly held position. When once under headway she was readily towed into the Iliinois Central slip, and the blockade was raised. Then the tugs had active work, and the craft began moving up the river, keeping the bridge-tenders sweating, and the pedestrians swearing. The Tacoma, though not as badly damaged as was supposed, had to go into dry-dock. The general loss to business on account of the embargo is very heavy, and has been estimated at nearly $500,000. The lumber market was bare and desolate during the blockade. The damage to the Tacoma has latterly been estimated at $3,000.

FOREST FIRES.

WOODSVILLE, N. H., May 19.—Baldwin's saw-mill and two million feet of lumber, also the depot, water-house, and 500 cords of wood, the property of the Montpelier and Wells River railroad, with two cars, have been burned. Woodland fires are raging in Twin Mountain, Jefferson, and Warren Summit, and much damage is anticipated. Thousands of acres have already been burned over. A large force of men are fighting the flames. The losses on standing and cut timber are already large.

A despatch from Plymouth says forest fires are raging fiercely on Mount Webster and Blueberry mountain, and a brisk wind is blowing. Nine hundred acres have been burned over, and a thousand cords of cut wood are imperilled. A special train has gone from here to Warren Summit with two hundred men to check the fire and to protect railroad property. Another fire is reported in the vicinity of North Concord.

TAUNTON, Mass., May 19.—Fifty acres of valuable woodland between here and Middleboro' were burned to-day. A large woodland fire is now raging in the west part of Dighton.

YAPHANK, L. I,, May 20.—Five destructive forest fires have been burning in the woods surrounding Yaphank since the 10th inst.

MONTPELIER, Vt., May 20.—The most disastrous forest fire that ever occurred in Vermont started yesterday in the vicinity of Groton. An immense tract has been burned over and a large amount of property destroyed. The loss is estimated at $150,000.

LANCASTER, N. H., May 20.—Fire started in the woods on Cherry mountain on Saturday, and spread over a large territory, causing a loss of $10,000 worth of timber. Wickers' saw-mill and boarding house at Jefferson, with a large quantity of logs and manufactured lumber, and Willoughby and Gale's coal kilns, with 2,000 cords of wood, were burned.

THE *Northwestern Lumberman* says:—Cedar is one of the woods that many pine operators are holding in reserve. On one stream in Michigan a large saw-mill concern owns a large body of cedar, but they will not sell a stick of it, and at present have no occasion to cut it themselves. They think it is good property to hold on to, considering it cost them but little, and undoubtedly they are right. When the company's pine is exhausted the cedar will come in play. This is but one of many similar cases.

Second Growth Pine.

Not a small part of central and southern New England, no longer profitable for agriculture, is now growing up with white pine, and this, if it can only be protected, will, it is thought, soon exceed in value the net profit upon all the New England farms. In some parts of New England, this second growth of pine has been growing for a considerable time, and has already given rise to large and profitable industries. The value of logs cut in Maesachusetts during the census year reached nearly $2,000,000. At least one-half of these logs were of second growth pine. More than 100,000,000 feet of second growth pine were sawed during the same year in Vermont and New Hampshire, and nearly, if not quite, as much more in Maine. —*N. Y. Lumber Trade Review.*

Cheap Transportation.

The *International* of Emerson, Manitoba, hold the right view as to cheap transportation. It says:—"Carney & Watson, lumber dealers, are loading their large barge with laths for down-river points. The barge will be floated down river. Cheap locomotion and transportation. Nothing like having a navigable river for a transportation highway."

A Quebec despatch says that most of the timber cut this season on the St. Maurice and Batiscan rivers will be stuck this year in the drive.

IN a recent discussion on forestry Mr. Hough has suggested the possibility of training trees so that they may present a showy and a novel grain in veneer.

THE *Northwestern Lumberman* says:—A report reaches us from Arkansas that the owners of pine lands in the southwestern part of that state are considerably agitated by the ravages of some sort of a bug that strips the pine trees of all their foliage, and leaves them looking apparently as though they were dead. Some claim that the trees will die, whilst others think they will not be materially injured. The worm, it is said, as soon as its work of destruction is over, drops to the ground and dies; so that it appears pine spines don't agree with it, and it no doubt will soon tire of that sort of diet.

A NEW YORK correspondent of the *Northwestern Lumberman* says:—There is but little eastern spruce arriving as yet, and the supplies at the yards are being reduced. No changes have yet been made in prices. If values are held firm, or advanced, it will be so through a power that is stronger than the association recently formed. There is a drouth in Maine, and the rivers down which spruce is brought to market are at a very low stage of water. It is said by those who are conversant with the country that they are as scant of water as they are usually during the driest days of summer. This will hang up vast quantities of logs, and if enough do not come down to meet the demand prices will naturally stiffen. There is no abundant supply to draw from in this market at the present time, but if there comes plenty of water in the eastern rivers there will be large quantities soon ready to push into market, and then prices may suffer.

A BOSTON correspondent of the *Northwestern Lumberman* says:—From conversation with several of our largest wholesalers the past week, I can sum up the several opinions of trade about as follows: Every one asserted that the trade has been held back fully a month by bad weather, but that from this time on it will increase and hold good until well into the fall. No one predicts a boom, but there is to be a steady, general demand for all kinds of building and manufacturing lumber. I talked with a reliable party yesterday, who has just returned from Bangor. He reports the prospects of getting in the spruce logs as very discouraging. The frost went out of the ground so gradually that the melted snow soaked into the ground, instead of swelling the small streams, and unless there are heavy rains, sufficient to cause a rise of the water in the branch streams, it will be impossible to get in the logs, and there must necessarily be a scarcity. This will have a tendency to still further advance in price.

WATER POWER

TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.

R. & G. STRICKLAND

1d86 LAKEFIELD, ONT. w15l9

A RARE CHANCE!

Valuable Steam Saw-Mill

FOR SALE.

The Waba Creek Steam Saw Mills, situated on the Madawaska River, one mile from Arnprior. Capacity of Mill, Fifty Thousand Feet of Lumber per Eleven hours. Capacity of Booming Pond, Thirty Thousand Logs. Has Sidings through piling Grounds connected with main line of Canada Pacific Railway. The Mill is in good repair, having only run a short time, and is well found in all appliances required to run it to the above capacity. There is also a good water power connected with it from the Waha Creek, and good stabling, Barn, Boarding House, and other buildings. For information, price and terms, apply to John Robertson, 581, Seigneurs Street, Montreal, or to James McCuan, Arnprior, who will show intending purchasers the whole property, or to

ALEX. HECK,
6l11 Ottawa.

SAW MILLS
AND
TIMBER LIMITS
WITH
Logs, Lumber, Store Goods, &c
FOR SALE
In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

☞Canada Pacific Railway now running through part of the property.

For full particulars address:—

WILLIAMS & MURRAY,
L7tf GODERICH, ONT.

LACHINE CANAL.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the under-signed, and endorsed "Tender for the Formation of Basins near St. Gabriel Locks," will he received at this office until the arrival of the Eastern and Western mails on WEDNESDAY, THE 6TH DAY OF JUNE next, for the formation of TWO SLIPS or BASINS, on the north side of the Lachine Canal, at Montreal.

A plan and specification of the work to he done can be seen at this office, and at the Lachine Canal Office, Montreal, on the after TUESDAY, the 22nd day of MAY next, at either of which places printed forms of tender can be ohtained.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms.

An accepted Bank cheque for sum of $2,000,must accompany each tender, which sum shall he forfeited, if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer suhmitted. The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,

A. P. BRADLEY.
Secretary.

Dept. of Railways and Canals,
Ottawa, 21st April 1883. 6d100-2l12

REST not, life is sweeping by, go and dare before you die, something mighty and suhlime leave hehind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

GOVERNMENT SLIDES ACT.

The following Act is so important to lumber- that we give it in full :

An Act to make further provision respecting the regulation and collection of tolls on Government timber slides and other works constructed to facilitate the transmission of timber, lumber and saw-logs.

Whereas it is necessary to make more ample provision respecting the regulation of tolls imposed for the use of slides and other works under the control of the Government of Canada, and used for the purpose of facilitating the transmission of timber and lumber down rivers and streams, and also respecting the collection of such tolls, and the imposition and enforcement of penalties under the law or any regulation made thereunder; therefore Her Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows :—

1. In this Act the term "Works" means and includes the slides, booms, dams, bulkheads, and other works and improvements for facilitating the transmission of timber and lumber down any river or stream, which are under the control of the Government of Canada ; and the term "Collector of tolls and dues," means and includes every officer authorized by competent authority to receive any tolls, dues, or charges whatsoever, payable by any person using or taking advantage of any works to which this Act applies.

2. All works to which this Act applies shall, as respects the construction, repair, maintenance and management thereof, be under the control of the Department of Public Works, and as respects the collection of tolls and dues on any timber, lumber or saw-logs passing through or using the said works, the same shall be under the control of the Department of Inland Revenue.

3. In addition to the powers now in him vested by law in that behalf, the Governor in Council may, from time to time make, revoke, alter or amend regulations as respects matters relating to such works as aforesaid, and not specially provided for by this or any other Act, and for fixing the rates of toll, and the dues to be charged for the use of any such works, or of any series of such works (the rates in such latter case to be denominated through rates) and providing for the manner in which such tolls and dues shall be ascertained and collected, and also for imposing fines and penalties for any infraction of such regulations, not exceeding in any one case *five hundred dollars* ; and such fines and penalties shall be recoverable in such manner as shall be stated in the regulations imposing the same.

2. And the Governor in Council may make regulations authorizing a collector of tolls and dues on any works, in any case or class of cases to be specified in the regulation, to require any assertion of fact or any statement in relation to any matter to which this Act or any regulation made under it relates, to be verified by the oath of the person making such assertion of fact or statement; and the oath so authorized may be administered by any Judge or Clerk of any County or Circuit Court, or any Justice of the Peace or any Commissioner for taking affidavits for use in any Court in Canada, or by the collector of tolls and dues.

4. All tolls and dues chargeable for the transmission of timber, lumber or saw logs through or over any works shall be a first charge or lien on all or any part of such timber, lumber or saw-logs (each part being liable for the whole), and the same shall be liable for the payment of the tolls and dues thereon, so long as, and wheresoever, the said timber, or any part of it, may be found, whether it be, or be not, converted into deals or boards ; and all officers or agents employed in the collection of such tolls and dues, and all persons acting under the authority of such officers or agents may follow all such timber and may seize and detain the same wherever it be found, until the dues thereon are paid or secured as provided by this Act or by any regulation made thereunder ; and no transfer, assignment, sale, mortgage or delivery to another party, or change of owner, shall affect the claim or lien of the Crown on any timber, lumber or saw-logs, or sawn lumber, in respect of which, or of the timber, lumber or saw-logs out of which such sawn lumber was manufactured, any tolls or dues for the use of any works remain due and unpaid, saving always the right of the innocent holder to any remedy which he may have at law against the person from whom he received such timber, lumber or saw-logs, or the product thereof: Provided always, that no part of any such timber, lumber, saw-logs, or the product thereof, when *bona fide* sold, assigned, or transferred, shall be liable for more than double the tolls or dues accrued, in proportion to the amount chargeable upon the whole, upon such timber, lumber or saw-logs, or upon the timber, lumber or saw-logs from which the product was manufactured, in addition to the costs, if any, incurred in connection therewith.

2. And if any timber, lumber or saw-logs, in respect of which tolls or dues are chargeable, have been converted into sawn lumber and placed in any yard or piling ground with other sawn lumber, in such way that its identity cannot be ascertained, then, and in that case, all the sawn lumber in such yard or piling ground shall be deemed to be the product of timber, lumber or saw-logs which have passed over or through works to which this Act applies, and shall be liable for all tolls and dues with which the timber, lumber or saw-logs, the product of which has been so placed with other sawn lumber in such yard or piling ground, are chargeable.

5. If any timber. lumber or saw-logs, or product thereof, so seized and detained for non-payment of tolls, dues, penalties and expenses remain more than thirty days in the custody of the collector or person appointed to guard the same, without the tolls, dues, penalties and expenses being paid, then the Minister of Inland Revenue may order a sale of the said timber, lumber or saw-logs, or product thereof, to be made after such notice as he may deem sufficient ; and the balance of the proceeds of such sale, after retaining the amount of tolls, dues, penalties and costs incurred, shall be paid to the owner or claimant of such timber, lumber or saw-logs, or product thereof ; and should there not be sufficient realized from such sale to defray such tolls, dues, penalties and expenses, the amount remaining unpaid may be recovered with costs, in any Court having civil jurisdiction to the amount, by the collector of tolls and dues in his own name, or in the name of Her Majesty ; provided always that the whole amount of tolls and penalties may be recovered in like manner with costs from the owner or party in possession of such timber, lumber or saw-logs, or product thereof, by the collector of tolls and dues, should he, by permission of the Minister of Inland Revenue, choose that method of collection : Provided also, that all pecuniary penalties imposed by any regulation made by the Governor in Council under this Act may be recovered by the collector of tolls and dues, if he soes fit, by summary proceedings before any justice of the peace under the sixty-first section of the "Act respecting the Public Works of Canada," which applies to the works herein referred to.

6. Any officer or person seizing timber, lumber or saw-logs, or any product thereof, in the discharge of his duty under this Act may, in the name of the Crown, call in any assistance necessary for securing and protecting the property so seized ; and if any person under any pretence, either by assault, force or violence, or by threat of assault, force or violence, in any way resists or obstructs any officer or person acting in his aid in the discharge of his duty under this Act, such person being convicted shall be adjudged guilty of felony, and shall be punishable accordingly.

7. It shall be the duty of collectors of Customs, officers of canals, and all other Government officers, when requested so to do, to cooperate with the collector of tolls and dues and his assistants, with the view of preventing the transport of timber, lumber and saw-logs and the products thereof, till the charges thereon are secured.

8. All managers and officers of railways, on being requested by the collector of tolls and dues, shall render a correct account of all timber, lumber and saw logs being forwarded by their respective railways, stating kinds and quantities, and specifying the owners thereof or by whom sent ; and should any of such managers or officers refuse or neglect to give the required information, the collector of tolls and dues or person acting for him may, if he have reasonable cause to believe that the tolls and dues thereon have not been paid, seize and detain such timber, lumber or saw-logs together with the cars employed in removing them, and such cars and timber, lumber or saw-logs shall be forfeited to Her Majesty, unless it shall be proved that the tolls and dues on such timber, lumber or saw-logs have been paid, or that the timber, lumber or saw-logs are not liable for any such tolls or dues ; and the Minister of Inland Revenue may order the same when so forfeited to be sold at his discretion ; and the managers and officers of railways so refusing or neglecting to give the information above required, or giving false information, shall be personally liable for such fines and penalties as may be imposed by regulations.

9. If any person, whether pretending to be the owner or not, either secretly or openly, and whether with or without force or violence, takes or carries away, or causes to be taken or carried away without the permission of the officer or person who seized the same, or of some competent authority, any timber, lumber or saw-logs, or product thereof, seized and detained under this Act before the same have been declared by competent authority to have been seized without due cause, such person shall be deemed to have stolen such timber, lumber or saw-logs, or product thereof, and to be guilty of felony, and shall be punishable accordingly.

10. And when any timber, lumber or saw-logs, or products thereof, are seized for non-payment of tolls or dues, or any prosecution is brought for tolls or dues and penalties under this Act, and any question arises whether the tolls or dues have been paid on such timber, lumber or saw-logs, or product thereof, or whether the same are liable to tolls or dues for having used the works in respect of which the same are charged, the burden of proving payment or that the works were not used, shall lie on the owner or claimant of such timber, lumber or saw-logs, or product thereof, and not on the officer seizing the same, or the party bringing such prosecution.

11. It shall be lawful for the collector of tolls and dues, with the sanction of the Minister of Inland Revenue, to release from seizure any timber, lumber or saw-logs, or product thereof, seized under this Act, and to deliver the same to the alleged owner, on receiving security by bond with two good and sufficient sureties, satisfactory to him, to pay double the amount claimed as chargeable in respect of such timber, lumber or saw-logs, or product thereof ; and such bond shall be taken in the name of Her Majesty ; and if such seizure is maintained by competent authority, the amount actually due, with interest and costs, shall be paid forthwith to the proper officer, otherwise the penalty of such bond shall be enforced and recovered.

TREE-PLANTING.

A correspondent writes to the Minnedosa, Manitoba, *Tribune* as follows :—

SIR,—In your paper of the 13th I read an interesting article on tree planting, from the pen of Hon. Robert W. Furnas, of Brownville, Nebraska. In commenting on that article you say that there is every reason to believe that tree-planting would prove as successful here as in Nebraska. Allow me to say that I have held that belief ever since I came to the little Saskatchewan, and acting on that belief I set to work to prepare a piece of ground for the planting of trees on my homestead. Whether I have been successful or not I will let you and your readers judge. After preparing the ground the difficult part of the undertaking commenced, the all-important question suggested itself "what shall I plant?" Unable to satisfactorily settle the question for myself I wrote to a friend in Minnesota and asked for advice. My friend promptly came to my aid by sending me a Forest Tree Planter's Manual prepared by L. B. Hodges, secretary of the Minnesota State Forestry Association. After a careful study of this valuable book I thought the white willow would be the tree for me. My reason for this was two-fold : first it cost less than any other ; second the willow will grow from cuttings or slips. I sent an order to Minnesota for one thousand cuttings. The cuttings were shipped on the first of March, but those being the good old days of the ox and cart they did not come to Minnedosa till 15th of May. The following day I opened the box. I am not sure that I did not say some "cuss" words when I saw those plants. Little sticks about a foot long the size of a lead pencil and sharp at the big end was what what they sent me, and rather dry looking at that. I threw them in a pond to soak for a couple of days before planting, and then commenced sticking them in the ground and I am free to admit that never did I do work on the place that I was more ashamed of. I planted every one of them. There were 840 willows and 160 cottonwoods. In about a week the buds began to open and in less than one month they were out nicely and out of the whole lot only two failed. Never was man more pleasantly surprised than I was to see trees growing from those small dry sticks. During the summer months I cultivated those trees as I would a crop of potatoes. I kept that piece of ground as clean as a hungry hound's tooth, and in the fall I had a little forest of my own with trees measuring five feet ten inches in height and about one inch in diameter. Now sir, who among us will not want to know what kind of a tree a white willow is. I say it is of great use in a country like this, where there is no timber at all on many of our farms. Of course I am not prepared to say from my own experience how large a tree it is, but I will give others as my authority for saying it is a valnable tree.

Samuel Edwards, Bureau County, Ill., writing to the Germantown *Telegraph*, says :—"It has been growing here since 1845, and the more we become acquainted with it the better we like it. No other tree has made as rapid growth. Many are planting it all over the prairie for timber, much is being set for hedges."

J. Plank, Eyota, Minn., writing to the *Farmers' Union* says :—"I think white willow makes the best and cheapest fence. In six years from planting, you have a live fence which will last a lifetime."

General J. S. Brisbin, U. S. A., writing from Omaha to the Chicago *Tribune* says of the white willow :—"It grows from a shoot without roots, and foresters always praise its rapid and graceful return for the slight labor they bestow upon it. A tree of this kind attains a height of 60 to 70 feet and shows an immense trunk."

But why take up space with further testimony. You may say it is all foreign. In that case allow me to refer you to one of your respected townsmen, Mr. James Jermyn. He has seen my forest trees and talks of them with as much pride as if they were worth thousands to him. Now sir, I think if our Local Legislature would seriously take hold of the forest culture question and do something to encourage our farmers to plant trees, that it would be a wise and good act.

THE FUTURE OF THE COTTONWOOD.

The despised cottonwood may yet become the most popular as well as the most valuable tree. Late inventions and discoveries have revealed the fact that the finest polish and strongest household furniture can be made out of paper. It can be pressed so hard that no instrument short of a diamond can scratch it—and it can be given the finest shades in imitation of wood. and produced cheaper than walnut, mahogany, or ebony. And late discoveries in paper making established the fact that cottonwood makes the whitest and strongest fibre pulp yet manufactured out of wood. There are vast quantities of pulp imported, and some newspaper men are clamoring for it being free of duty. Paper-mills in Delaware, Pennsylvania, and other northern states are shipping thousands of cords of poplar wood from the Chowan river in North Carolina, one mill in Delaware contracting for 30,000 cords. This is costly, and shows conclusively that our rich lands, where cottonwood grows luxuriantly, and of which in many cases the black walnut has been deuuded to make furniture in Englaud, may yet become profitable fields to raise and manufacture paper, furniture, car-wheels and houses. Something has to take the place of pine, walnut and cherry in

house-building and ornamental wood-work, and the probability now is that the cottonwood is the coming tree. It is easier propagated, a more rapid grower, is exempt from enemies and parasites, and is a native almost everywhere. Forestry-men have troubled themselves about the future timber to supply the industrial pursuits. The best of car-wheels are made of paper, which stand the weather and wear longer than iron, and are less liable to accidents from breaking. If they will stand in this most difficult trial, paper can certainly be used in almost any place. And if it can best be made of cottonwood pulp, who doubts that this abused and derided tree is bound to come to the front and yet become one of the most popular timbers for tree cultivation.—*Iowa State Register.*

NEW YORK PURCHASES.

New York is after Lake Superior pine. According to the *Lumber Trade Review*, Lewis A. Hall and A. A. Buel, of the Export Lumber Company, that city, have recently completed the purchase of property situated upon Lake Superior. It comprises 50,000 acres of pine land on Waiska bay, a short distance above Sault Ste. Marie, with booming facilities for 20,000,000 feet of logs, and standing pine timber estimated at 250,000,000 feet, of which about 12,000,000 feet will be got in this season and sawed before the close of 1883. There is upon the property a mill running two circulars, with lath and edging works, shingle mill and all the necessary adjunct machinery of modern construction, together with a store, boarding house, tug and lighters and, in short, every necessary facility for carrying on a large business. The timber is of good quality, and the river which empties into the bay is navigable for a distance of 30 miles from its mouth. We learn that a large portion of the cut has been sold to an Albany dealer.—*Lumberman's Gazette.*

Driving Retarded.

The *Lumberman's Gazette* says:—Reports from every direction are to the effect that log driving is being retarded quite seriously. The Alpena *Argus* in alluding to this says that "the want of water in the various streams has hindered log driving very much, and the logs in many of the streams have been 'hung up.' The prospect for a successful drive, so far, is not very bright, and will cause the lumbermen considerable extra expense." The reports as above from Thunder Bay territory are similar to those from the headwaters of the streams tributary to all the great manufacturing centres, which indicates unmistakably that the lumber production of Michigan will be short of that of last year. The Ludington *Record* says that "the mills started up a month later this year than last. On July 1st, 1883, but two-thirds the amount of last year's cut to same date, will be manufactured. The total cut for 1882 at Ludington was 139,248,851. The estimate for the present year is 115,000,000."

Re-wooding Denuded Forest Lands.

QUEBEC, May 15.—A striking example of the practical advantages of re-wooding denuded forest lands is noted in connection with the celebration of Arbor Day in this section of the Province to-morrow. Hon. Mr. Joly, who prosecutes an extensive lumbering business on the Seigniories in Lotbiniere County, is actually reaping the fruits of re-foresting; timber which he has been cutting for years past having been planted by his own father on the land from which the primæval growth had long been cleared by the early French settlers.

THERE is at present, comparatively speaking, very little lumber on the Saginaw river mill docks unsold. When we consider the enormous amount left over last fall, it does not look as though the season thus far has been a very dull one. As all the best lumber has been sold fully up to last fall's prices, and the balance has been disposed of at trifling concessions, the market may be considered as fully up to expectations, and a prominent lumberman on the river states that with the exception of hard lumber and bill stuff the market is in better condition than it was last year at this time. This is interesting. —*Lumberman's Gazette.*

Chips.

AT Auburndale, Wis., on May 14, six million feet of lumber belonging to O'Connor & Co,, also a quantity of lumber belonging to the Conley Manufacturing Company were burned. It is believed to be the work of an incendiary.

THE planting of 100,000 eucalyptus trees on the Roman Campagna has counteracted the effects of the deadly malaria to such an extent that Tre Fontaine, the abbey of the Trappist monks, is rendered habitable through the entire year.

THE members of the Northwestern Lumber Manufacturers' Association, as a body, will take no steps toward reducing the cut of their mills in accordance with the original design of the association. Some concerns in Minneapolis, however, will reduce their cut twenty-five per cent.

THE *Lumberman's Gazette* says that eleven hours a day is now the schedule time in the Grand Haven mills. Last season the men put in twelve hours a day. Gradually the saw mills of the country are reducing their working hours, and in a few years ten hours will undoubtedly constitute a day's work in most of the mills in the country.

THE *Lumberman's Gazette* says:—Grand Haven mill men are setting a grand example by agreeing to close down on the afternoon of decoration day. This should be followed by similar action in other cities, until decoration day becomes a recognized national holiday, on which to commemorate the glorious deeds of the noble men who went forth in their country's defence, in her great hour of peril.

IN South Australia a bonus of $10 per acre is given to owners who successfully establish not less than five acres in trees, which if in strips must be at least 100 feet wide. The Governor is empowered to proclaim parts of the country to be "forest districts." A Conservator of Forests has been appointed and in five years nearly 3,000 acres of public land have been planted, nurseries, etc., started, and fire-breaks made and kept clear.

IN consequence of the demand for mahogany of late it has been feared that the supplies will fall short. The vice consul at Puerto Plato, San Domingo, states, however, that the diminution in the exports of mahogany is by no means to be attributed to the scarcity of the wood, for the forests are apparently inexhaustible; but is to be accounted for by the absence of suitable tonnage for charter in the neighboring colony of St Thomas throughout the year.

THE *Lumberman's Gazette* says that the demand for lumber must continue just so long as the local papers throughout the country are filled with items similar to the following clipped from an exchange:—"Carpenters, joiners, masons, painters and paper-hangers were never so busy as the present spring. Several new residences are being erected, many additions being built, and repairing and overhauling is the order of the day. It is almost impossible to employ a mechanic."

A SYNDICATE consisting of P. C. Heald, Byron Burch and Dr. W. E. Burtless, of Midland, Michigan, have concluded a purchase from John Larkin of some 2,000 acres of wild land, situated in Larkin township. Quite a portion of this land is covered with green timber—oak, ash, elm, etc., while another portion of it will yield an amount of timber estimated at 1,000,000 feet. It is the design of the purchasers to put a portable saw mill in and to commence soon the manufacture of some of this timber.

THE *Timber Trades Journal* says:—With regard to the cargo trade we hear of no movement in the market yet, and although a few shiploads have been placed here and there in an incidental sort of way, the general disposition of the wholesale houses seems to be to still hold off. On the other hand coast buyers have not been quite so quiet as some anticipated, and the shippers have placed a much greater quantity of goods amongst the outport firms than they are generally credited with. This is discernable in the present extensive demand for tonnage, which, we are given to understand, is fully up to the average.

THE *Manufacturer's Gazette*, published at Boston, has this to say of the lumber market in that city: An increased activity is manifested in the lumber market and a good business is doing in all departments. In southern pine business is very good. Mills at the south still decline orders. The tendency of the market is upward. In the local trade the demand has improved and stocks are reducing. The combination of manufacturers still uphold prices, and, owing to the backward spring, the situation is rather in their favor. A good business is reported by members of the combination. The outlook for the lumber trade in general is very encouraging.

THE New York *Lumber Trade Review* says: The West Indies are taking very liberally of white pine, the shipments thus far this month comparing very favorably with those of March. There is, however, some little scarcity of good shipping boards, and additional supplies in quantity can hardly be expected before navigation opens. The yards continue to seek necessary stock in Albany, but the majority are purchasing lightly in anticipation of doing better after the opening of the canals. The quantity of stock carried over from last fall rather exceeds that of same time last year, but holders do not appear willing to grant any material concessions with a view of reducing it.

THE Toronto *World* says:—The saw-mill men of Muskegon have determined to run their mills only ten hours a day, and thereby reduce the cut in order to counteract the influence of the action of dealers in Chicago, who resolved not to buy lumber unless at a reduction from present rates. It would be a good thing were the same plan generally adopted, not only in the lumber trade, but in many other manufactures. What sense is there in working mill and factory hands twelve or fourteen hours a day only to bring about the result of a glutted market and non-paying prices? The masters would benefit themselves, as well as the men, by making ten hours the rule in nearly all trades.

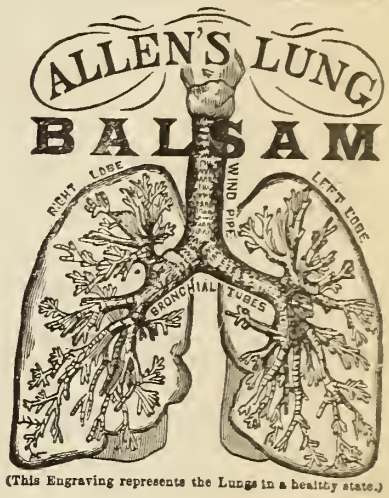
THE *Lumberman's Gazette* says:—Since the death of Sir Robert Christison the investigations on the growth of wood in deciduous and evergreen trees, begun by him, have been continued by Dr. Christison, who has published these results: Evergreen trees began their growth much earlier in the year than the deciduous, and stopped their rapid increase much sooner. It was therefore evident why the variations in growth in successive years did not follow the same law in these two classes of vegetation. An early winter had its influence directly shown in deciduous trees, and a late one in evergreen trees. When the winter was wet the growth of the deciduous was very apparently more affected than that of the evergreen trees.

MR. S. S. AVERY, of 320 North Third street, St. Louis, carries an ivory-headed live oak cane, which is made from the first wood ever cut by a white man's axe in America. The Spaniards, when they settled St. Augustine, Fla.. in 1565, bent themselves first to building a block-house. This was constructed of live oak logs, and it stood until 1844, when it was torn down. The wood of which the cane is made was taken from one of the logs of the block-house by its present owner, who had it turned and mounted with an elephant's tusk. It has been in his possession in constant use ever since, except on such occasions as he loaned it for exhibition in Iowa, Kentucky, and other States.—*Southern Lumberman.*

THE Ottawa *Free Press* says that one of its reporters interviewed several boat owners regarding the manner in which they would be affected by the strike of the American boatmen. The prevailing impression is that lumbermen will endeavor to procure Canadian barges to convey their shipments to Whitehall, where American boats will be employed, if possible, at cheap rates, to convey them on to New York. The lumber yards, with the exception of Sherman & Lord's are comparatively vacant as yet, but when the cut reaches large proportions, something will certainly have to be done to ship the lumber away. Mill owners just now seem determined to resist the demand of $4 asked by the Americans, while the latter are equally determined to hold out, having it is said, some $5,000 to back them.

THE COTTONWOOD.

There has been a question raised as to whether the cottonwood came under the meaning of the government as a timber tree. The commissioner of the general land office has rendered a decision affirmatively. He says: "Under the current rulings of this office, and the department, the cottonwood is regarded as a timber tree, and cultivation of the same by timber culture claimants is accepted as a compliance with the law, so far as the quality of the timber is concerned. While it is shown by the testimony that this tree is not used to any great extent in the locality for manufacturing purposes, building, fencing or firewood, yet it appears that it is used for outbuildings, houses, fences and firewood occasionally, according to the notion or necessity of the settler, or the distance from timber of a superior kind. The cottonwood tree, as it grows in the locality, is, therefore, not either useless for the purposes mentioned, or merely ornamental. This is apparent from the evidence in the case. The entry is held for cancellation, for the reason that the land was not subject to timber culture entry, the same not being prairie land or other land devoid of timber."—*Northwestern Lumberman.*



(This Engraving represents the Lungs in a healthy state.)

THE REMEDY FOR CURING

CONSUMPTION, COUGHS,

COLDS, ASTHMA, CROUP,

All Diseases of the Throat, Lungs and Pulmonary Organs.

BY ITS FAITHFUL USE

CONSUMPTION HAS BEEN CURED

When other Remedies and Physicians have failed to effect a cure.

Recommended by PHYSICIANS, MINISTERS AND NURSES. In fact by everybody who has given it a good trial. *It never fails to bring relief.*

As an EXPECTORANT it has no Equal.

It is harmless to the Most Delicate Child.

It contains no OPIUM in any Form.

☞Directions accompany each bottle.
☞For sale by all Druggists.

PERRY DAVIS'

VEGETABLE

PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used exterually, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c

The PAIN-KILLER is sold by mediciue dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

Market Reports.

MONTREAL.

From Our Own Correspondent.

MAY 26.—Since the date of our last report very little activity has been observable in the state of this trade, but although we cannot as yet change prices the market may be called easier. Laths are coming in to some extent, but as plastering has been retarded owing to the state of the weather, retail lots are still sold at $3.00, but wholesale lots can be had at our quotations. There has been a good inquiry for ash at our quotations. There was a large attendance of buyers at the auction sale of lumber on account of Messrs. Henderson Bros., who have been obliged to remove their yard, as the ground is required for the new lumber basins to be erected by the Dominion Government. A large quantity of lumber changed hands and the prices obtained are considered fair, footing up to over $40,000. The balance of the lumber will be disposed of next week. Lumber is not arriving so freely as was looked for, but considable importations are daily expected. We quote prices ex yard as follows :—

Pine, 1st quality, ℔ M	$35 00@40 00
P ne, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00
Pine, 4th quality deals, ℔ M	11 00@12 00
Pine, mill culls, ℔ M	10 00@12 00
Spruce, ℔ M	10 00@13 00
Hemlock, ℔ M	9 00@10 00
Ash, run of log culls out, ℔ M	20 00@25 00
Bass, " " ℔ M	17 00@20 00
Oak, ℔ M	40 00@50 00
Walnut ℔ M	60 00 100 00
Cherry, ℔ M	60 00@00 00
Butternut, ℔ M	35 00@40 00
Birch, ℔ M	20 00@25 00
Hard Maple, ℔ M	25 00@30 00
Lath, ℔ M	1 75@ 2 00
Shingles, 1st, ℔ M	3 00@ 0 00
Shingles, 2nd, ℔ M	2 50@ 0 00

FREIGHTS AND SHIPMENTS.

Rates by steamship and sailing vessel to England are 65s. for deals and 67s. 6d. for boards. To the River Platte there has been engagements at $13. A considerable quantity of lumber has been shipped by steamers to Liverpool since the opening of navigation, as will be seen by the following memoranda taken from the custom house returns. S S. Lake Champion, 75 standard deals; S S. Ontario 7,711 pcs deals and 3,144 boards ; S S. Texas, 1,126 boards and 4,293 pcs deals; S. S. Circassian, 9,061 pcs deals ; S S. Dominion 7,711 pcs deals and 3,144 boards. To Glasgow S S. Cynthia 10,409 pcs deals and 109 sacks spools; to Bristol S S. Dorset, 1,323 pcs deals.

CORDWOOD.

Receipts of wood by barges show a falling off as compared with the same period of last year, this to some extent is made up by what is brought in by the G. T. R., and there is plenty to supply the consumptive demand, but no change can be noted as yet in price, and we continue to quote at wharf ex cartage :—

Long Maple	$ 6 50
Short "	6 00
Long Birch	5 50
Short "	5 00
Long Beech	5 00
Short "	4 75
Long Tamarack	4 50
Short "	4 00

TORONTO.

From Our Own Correspondent.

MAY 23.—Considerable lumber has left the docks since my last letter, most of which has been carried by Capt. Hall's vessels, four in number, capable of conveying in one trip nearly one and a half million feet of lumber. So that although our docks may be well blocked with lumber on the arrival of this fleet, they appear quite forlorn on their departure. This cannot last long, however, the balance of last year's cut will soon be all away, and on account of the late starting up of the mills this spring, there must of necessity be a dearth of lumber for a longer period than usual, until the new cut is fit for shipment. Vessel owners and captains are conscious of this and feel quite gloomy over the prospects.

Sales by car load during the last two weeks have been quite limited, retail dealers being anxious to lower their stocks on hand, before making fresh purchases, and in this respect most of them have well succeeded, as from personal observation I can affirm that I have seldom noticed stocks as low as in most of the retail yards at the present time, more especially is this the case in bill stuff, lath and shingles, but as the mills are now fairly at work, this state of things may soon be altered, and in this connexion I would remark that many of the manufacturers have yet to learn wisdom as regards the manufacture of bill lumber ; many of them seem to have the idea that anything is good enough for bill stuff, and turn it out with waney edges and slab ends, so that on its arrival here perhaps one third is culled, and they seem to think that they are being hardly treated, when, in fact, the fault is all their own, and the sooner they become convinced that lumber so manufactured will not pass muster, the better for themselves.

The yards are all doing a good trade, considerable improvement having taken place in this respect since I last wrote you. Prices are also fully maintained.

BOSTON.

Cotton, Wool and Iron of May 26, says : There is a good, steady volume of business doing, and values keep along on quite an even basis. Western pine is in good demand and prices are quite firmly sustained. Eastern lumber is in steady inquiry, and values fully hold their own. Southern pine is quiet but fairly steady. Hardwoods are in moderate demand, and desirable selections are well sustained in price.

We quote cargo lots :—

Uppers	$46 00@48 00
Common	18 00@22 00
Culls	13 00@15 00

CHICAGO.

The *Northwestern Lumberman* of May 26, says :—The arrivals of cargoes at the docks for the week ending Wednesday did not show an increase over the previous week, notwithstanding the heavy gale of Sunday, Monday and Tuesday. On Monday the arrivals numbered 50, only a portion of which, as is usual stopped at the market. The offerings have been taken quite freely, only a few cargoes having dragged on the market. Prices of lumber have not varied quotably from the previous week, though two or three sales of piece stuff have boen reported as low as $9.

The contest between purchasers and sellers of lumber on the market is a little more earnest than it was a week since. The season is advancing, and the jobbers have not witnessed such a softening down of holders' views, as they have been hoping and waiting for. Several of them have been over the lake to buy, and most have returned without making purchases. They bring back tidings of discouragement from the mills. The hearts of the manufacturers are still like Pharoah's. If anything they are growing more adamantine. Commission men talk more confident than they did, and the manufacturers move around among the boys at the market and indulge in a good deal of stout expression about their ability to hold up prices. It must be confessed that the jobbers are not jubilant. They do not claim that the market is weakening, but, on the contrary, express surprise that it exhibits so much backbone. They assert that they cannot possibly afford to pay the prices at which cargo lumber is selling, and at the same time hope to escape without loss. Some of the manufacturers are frank enough to say the same thing, but so long as they can sell lumber for going prices, they cannot see why they should let it go for less ; what lumber will bring is what it is worth. The condition is an anomalous one, and why it should exist is not as clear as it might be, though each side of the difference has a theory about it.

The offerings have been taken so quickly during the past week that it has led commission men and holders to think that the market has touched bottom, and that it will be easy hereafter to certaiuly maintain current values, aud possibly realize a slight advance later on. They are at least encouraged to expect a hardening of prices, and consequently less trouble to sell at steady figures.
